Dr. Folliott. Ay, there is another enchanter. But I mean the great enchanter of Covent Garden; he who, for more than a quarter of a century, has produced two pantomimes a year, to the delight of children of all ages, including myself at all ages. That is the enchanter for me. I am for the pantomimes. All the Northern enchanter's romances put together would not furnish materials for half the Southern enchanter's pantomimes.

Lady Clarinda. Surely you do not class literature with pantomime?

Dr. Folliott. In these cases I do. They are both one, with a slight difference. The one is the literature of pantomime, the other is the pantomime of literature. There is the same variety of character, the same diversity of story, the same copiousness of incident, the same research into costume, the same display of heraldry, falconry, minstrelsy, scenery, monkery, witchery, devilry, robbery, poachery, piracy, fishery, gipsy-astrology, demonology, architecture, fortification, castrametation, navigation; the same running base of love and battle. The main difference is, that the one set of amusing fictions is told in music and action; the other in all the worst dialects of the English language. As to any sentence worth remembering, any moral or political truth, anything having a tendency, however remote, to make men wiser or better, to make them think, to make them even think of thinking; they are both precisely alike; *nuspiam, nequaquam, nullibi, nullimodis*.

Lady Clarinda. Very amusing, however.

Dr. Folliott. Very amusing, very amusing.

Mr. Chainmail. My quarrel with the Northern enchanter is, that he has grossly misrepresented the twelfth century.

Dr. Folliott. He has misrepresented everything, or he would not have been very amusing.

It is evident that neither Peacock nor Mr. Payn can be said to have been endowed with a catholic taste. Peacock saw little or nothing to admire in Scott; Mr. Payn sees nothing to admire in Peacock; and it might be possible to find some great author in whom Scott saw nothing to admire. "And thus the whirligig of time brings in his revenges." Those who admire in their different degrees all three writers can only be retrospectively sorry for Peacock, and presently sorry for Mr. Payn.

Mr. Payn gives some striking and interesting cases of a courage akin to his own, amongst which is Miss Martineau's confession to him that she found *Tom Jones* a wearisome book; and this gives him an opportunity for making some brief but excellent critical remarks on *Tom Jones*, which we will not spoil by quoting. Miss Martineau was, with regard to her dislike of the book on some grounds, in good company, if Colonel Newcome is to be accounted good company. On the subject of Milton the writer is orthodox; and we are pleased to hear how "he *did* have it out" with some one who, at the mention of the *Earthly Paradise*, exclaimed scornfully, "Oh! give me *Paradise Lost*," and who was driven, under cross-examination, to confess that he had never read a word of Milton for forty years, and then only in extracts from *Enfield's Speaker*. Of Shakspeare he writes, truly enough, that, though there is a good deal of lying about him, yet in the main people do know at least a little of him, and admire what little they know. Probably in the days of Otway the same people would have gone with the crowd of detractors just as they go now with the crowd of admirers. But, however that may be, they are at least "in a position much superior to" that of an acquaintance of Mr. Payn's, who informed him that "her daughters were going to the theatre that night to see Shakspeare's *Turning of the Screw*." The story sounds extravagant, but it is not perhaps really more odd than many authentic stories of a like kind, amongst which may be cited that of the spectator who, at the end of the first act of *Hamlet*, said, pointing to the retreating figure of the chief tragedian who had been called before the curtain, "Can you tell me, sir, if that young man appears again?" On being told that the young man did appear again not infrequently, he added, "Oh! Then I'm off."

On the whole, we may conclude from what Mr. Payn says, that he does admire Shakspeare. Yet, although he certainly displays in the course of his entertaining article a good deal of the courage of his opinions, it is barely possible that he shares the sentiment which George III. expressed when he told Miss Burney in confidence that Shakspeare was greatly overrated, only it didn't do to say so.

CONTROVERSIAL HORNETS' NESTS.

A PAPER of which the exact designation in its special class of literature is uncertain, since its four pages are insufficient to raise it to the dignity of a "tract," while the more modest "leaflet" may not boast of more than two, has recently been issued by a Society or body of persons whose designation is indeed not uncertain, but only, to the ordinary lay comprehension, unintelligible. This Society appears to be known as the "Irish Church Missions," and to have its headquarters in a street leading from the Strand to the Embankment. It was, therefore, probable that some key to its nature and objects might be within our reach, and the now recognized encyclopædia for statesmen and candidates, *Whitaker's Almanac*, was fortunately at hand. The search was fruitless; and an appeal to the *Churchman's Almanac* was made with no better result. Internal evidence and analogy alone remained for the solution of the question, What can "Irish Church Missions" be? The Fiji Islands Mission is known to be a mission to the Fiji Islands; these missions might therefore be supposed to be missions to the Irish Church. But to what "Irish Church"? Grave difficulties beset the adoption of either of the only possible answers to this query. The American Church Missions are missions conducted by the American Church; and these therefore may be similar missions undertaken by the Irish Church. But then the Irish Church is not situated in the Strand; and, as an additional difficulty in the way of this interpretation, the internal evidence shows that the field in which these missions work is Connemara, itself a district in Ireland in which the parochial system of the Irish Church exists; so that the conception would involve the obvious impossibility of a mission sent by the Irish Church to itself. The only remaining explanation would seem to be that the term Irish is used to differentiate certain Church Missions of a Hibernian and possibly abnormal type, and this solution best meets the peculiar circumstances of the case. The paper narrates, in the form of correspondence, an episode arising out of the administration of the Duchess of Marlborough's Relief Fund; and the actors or writers are certain officials of the mysterious "Irish Church Missions" on the one part and Lord Randolph Churchill on the other. The nobleman, as the scene opens, is discovered standing alone, like the Knight of Snowdoun in the *Lady of the Lake*, while two shadowy figures disappear in the background, Colonel Spencer and a certain Mr. Baker, whose desertion of their chief, under the circumstances, strikes us as slightly ungrateful, though undeniably prudent. The pluck and dash of the solitary combatant comes out in consequence into clearer relief. He executes a masterly retreat in the end; but this was inevitable through the very pardonable mistake of his original plan.

Lord Randolph Churchill took a high class at Oxford, where the School of Law and Modern History furnished him with valuable methods of preparation for public life. But there is reason to fear that he did not make sufficient use of his opportunities in Long Vacations, and that he missed some hardly less valuable lessons which he might have derived from the experience of under-gardeners and keepers' boys at Blenheim. He has evidently never mastered the scientific method of "tackling" a hornet's nest. This is a process which requires something beyond mere go and courage, and we have ourselves a very distinct remembrance of the entire failure of an experimental application of blazing turpentine for the purpose. We congratulate Lord Randolph on having escaped without a sting, as we did; but the immediate result was only to leave the hornets very indignant in their own heavy way, expressed in much solemn buzzing from and around their central "office." Fortunately the hornet is not a very dangerous enemy. A wasp, in his body-armour of black and yellow in bars, has all the speed in going and skill in steering with which Oxford men are familiar under a like arrangement of colour; but the hornet, an insect of different build and of a pronounced orange hue, has just as much and as little likeness to his active congener as that which exists between a Thames barge and the Brasenose eight. He will make a heavy kind of rush at his assailant in a straight line, which he does not know how to change; and then he will go back to his retreat in some obscure hole where the small society to which he belongs—for hornet communities are always small—dwells surrounded by a collection of papers constructed after a peculiar fashion of their own, and where their existence is only revealed to curious investigators by a continuous dull hum proceeding from inside.

But the investigator should not rashly probe the hole in the bank, or roof, or hollow tree with his finger or his stick; and Lord Randolph Churchill, even in a private letter to his uncle, "in reply to Mr. Baker's inquiries" concerning any possible sectarian distinctions in the distribution of relief, was somewhat rash in writing as follows:—"Mr. Cory, I am happy to say, is not a member of" a certain Committee receiving grants; "that gentleman occupies the unenviable position of being the head of a Society known as the 'Irish Church Missions'—a Society whose object is to pervert the Catholic peasants by all sorts of bribes and unworthy dodges. Connemara, the only district in Ireland where this mischievous Society has had any success, has been so long disturbed by their efforts that any effectual relief of distress is rendered very difficult. Mr. Baker and his friends will do wisely to receive any statements from this Society with great suspicion." There is something about this direct and vigorous style of treatment which might certainly prove a little irritating to the members of a Society strongly orange in hue and provided by nature with stings; and the writer, although evidently well up in his *Tancred*, was so far unmindful of, or unwarned by, the experience of a great authority on modern history, who once dated a letter from a still more august residence in which he chanced to be staying, as to head his conciliatory effusion "Private Secretary's Lodge, Phoenix Park." Thus dated, the letter became in law the property of the Postmaster-General; and what that excellent nobleman did with it—whether Colonel Spencer ever received it, or whether, having received it, he failed to "take care of his pockets," or merely left it lying about, or willingly otherwise disposed of it—does not appear in the evidence, and we do not know. It was dated on the 1st of February; and on the 4th of that month it suddenly turns up at Clifton, where "an officer of the Society" and of the Royal Artillery, Colonel Biggs, chanced to be resting in one of his flights. Immediately this gallant gentleman rushes point-blank at "my Lord." "A letter of yours to the address of Colonel Spencer, dated February 1st, has been sent to me." As it happened, the letter had been written, not "to the address of Colonel Spencer" merely, but to "dear Colonel Spencer" personally; and while it may be assumed that the Artillery Colonel's eccentric style of composition was only the casual result of excited feeling at the moment, we will venture to express a hope that he does not point his guns on quite the same method as his sentences. But "all sorts of bribes and unworthy dodges," ascribed, too, to a "Society" whose "object and work" is "to give to ignorant Roman Catholics" an "inestimable blessing . . . . in place of deadly error," were really too much for Colonel Biggs to put up with; he "felt bound in duty and honour to make the same known to the Committee of the Society"; but before doing so he had "the honour to request" an explanation from "my Lord." There is a familiar tone of the old Adam about this missive which suggests that "a friend," if that had been possible, would have been more to the writer's mind than a "Committee," and Lord Randolph Churchill's reply by return of post seems hardly calculated to still the rising temptation. He declines all correspondence with the Colonel, with whom there is no chance of an amicable agreement, adding, however, with a cruel hidden meaning, "I trust that it will not occur to you that I am a Papist in disguise."

Upon this Colonel Biggs withdraws from the scene, and a fortnight elapses before, on February 19th, Captain the Hon. Francis Maude, R.N., writing from the London office of the Society—of which it is now seen that he, as chairman, and not some unknown Mr. Cory, is "the head"—"has the honour to request" distinct explanation about the "bribes and unworthy dodges," as "this Committee cannot make light of such statements dated from the Private Secretary's Lodge." We regret to add that this solemn warning was quite lost on Lord Randolph Churchill, who, whether the Committee could or could not "make light" of him, proceeded on the 20th February to show himself perfectly capable of making light of the Committee. Again providing himself with the note-paper obnoxiously headed "Private Secretary's Lodge," and assuring "F. Maude, Esq.," that, "though I do happen at present to inhabit" that dwelling, "I am not, and never have been, Private Secretary to the Lord-Lieutenant"—which perhaps, all things considered, shows a wise as well as patriotic abnegation of paternal feeling on the Duke's part—he attacks the whole community in its nest with a yet more blazing torch than had been applied to its wandering members in the first instance. "F. Maude, Esq." (Sir Bernard Burke does not seem to have been at hand) "appears to have the honour of being Chairman of the Irish Church Missions Society"—"appearances" in the case being at least justified by his own direct statement to that effect; and Lord Randolph Churchill will have nothing to do in the way of this controversy "either with you, or your Society, or any one else." "A certain Colonel Biggs appears to have got hold of this letter" ("a private communication from me to my uncle"), "somehow or other"; and "I presume that Colonel Biggs considers himself an officer and a gentleman, as well as an eminent Christian." There is more in the same strain which it is not necessary to quote, and which we think would hardly have been written if Lord Randolph had studied the habits of *Vespa Crabro* under the keeper's boy. All the result obtained was in the form of a tremendous onslaught of the whole Society represented by its Chairman, from which Lord Randolph had no resource but to protect himself by bolting into "St. James's Club, Piccadilly," and "having the honour" from that safe shelter "to acknowledge the receipt of your letter of the 26th inst."—this time properly superscribing his note to "the Honourable Francis Maude."

Into the merits of this lively "affair" there is no occasion for entering. Rightly or wrongly, there are and have been for several years in Ireland certain persons contumeliously described as "soupers"; and whether or not these converts and their English patrons be the survivors or representatives of the "Second Reformation" immortalized in *Tancred*, to which "the babe in arms subscribed its fanatical five shillings," there is little doubt that "what was principally wanted in both cases were, subscriptions." Lord Randolph Churchill will in all likelihood prove to have been the best "deputation" that the Society ever yet retained. His rhetorical periods are reaching the ears of thousands of Protestant households, and a responding stream of post-office orders may soon be pouring into Buckingham Street. Indirectly, therefore, he may learn, or at least may set into practical motion, the scientific method of capturing nests to which we have already referred, and which has often been known to succeed when the blazing turpentine treatment has failed. The requisite appliances are very simple. A ladder, a cord, and a brown jar; for its contents, the keeper will recommend

a basis of beer, the Scotch gardener will incline to whisky; a little patience and persistency in presenting it day by day at the entrance of the Society's quarters; and the hornets' own blundering will do the rest. They will consider the offering as a tribute to their recognized merits, themselves as a Society supported by voluntary contributions; and the end will not be far off; they will gradually, but totally, disappear. We have every sympathy with Lord Randolph Churchill, who has only gone about a right work in an inartistic way; and we strongly advise him to take counsel with the experienced authorities at Blenheim as soon as he can find an opportunity, and to profit by their suggestions on any future occasion when he may feel himself called on to deal with the hornets of modern religious controversy.

THE POST OFFICE MONEY-ORDERS BILL.

AN innocent-looking measure, introduced at the beginning of the Session which is about to end so abruptly, by the Postmaster General and Sir H. Selwyn-Ibbetson, "to grant additional facilities for transmitting small sums of money through the Post Office," has aroused an amount of opposition amongst bankers not very intelligible to the general public; and, what is more curious still, the Bill seems to have met with the approval of the Governor of the Bank of England, who, of all persons, would have the best right to object on the grounds on which the opposition is based. It is hardly necessary to argue that the professed object of the Bill is a desirable one. The money-order system of the Post Office, however defective it may be in other respects, is eminently successful at least in this, that year by year it grows in popularity. And that, after all, is the best test of its usefulness. All parties, then, must admit that it is desirable to increase as much as possible the usefulness of so popular a system. But it is objected by the opponents of the Bill that, as a matter of fact, it does not give increased facilities for transferring small sums through the Post Office, while, on the other hand, it introduces an innovation that ought to be strenuously resisted by all who wish to maintain a sound currency in England. To make the points at issue clear it may be well to sketch briefly the history of the measure.

In the year 1870 the net profit of the money-order business of the Post Office was estimated at 51,000*l.*, and—to bring within the reach of the poorest of the saving classes a system thus proved to be highly prized by the public—in the following May the rates of charge for Post-Office orders were greatly reduced, the minimum being lowered from threepence to one penny. The change was fully appreciated by the public, as is proved by the fact that, whereas in 1870 the number of orders issued was only 10 millions and the amounts sent only 20 millions sterling, in 1875 the number issued exceeded 16½ millions and the amount sent 26¾ millions. In other words, the number of orders issued increased in the five years more than 65 per cent., while the amounts transmitted increased 33¾ per cent. It is quite clear from these figures that the usefulness of the Post Office Money-Order Department admits of being indefinitely augmented, and that the way to do so is to reduce the charge for orders. Unfortunately the experiment to which we have just been referring was pecuniarily a failure. In 1870, as we have already stated, the net profit on money-orders was 51,000*l.*, and in 1875 it had fallen to 4,556*l.* Even this represents the business too favourably, for there was an actual loss of over 1,300*l.* on the home orders, which the higher rates charged on foreign and colonial orders converted into the above-mentioned small profit. The question then naturally arose, How could the usefulness of the department be maintained and extended without inflicting loss upon the Post Office? Various schemes were propounded, and in 1876 a Committee was appointed to consider the most promising of these. In the following year it reported, though with considerable hesitation, in favour of postal notes. A Bill was introduced accordingly, giving authority to the Post Office to issue such notes, but was withdrawn, and in the present Session a more matured measure, having the same object in view, was brought in. This latter Bill consisted of three clauses, of which one exempted the Post Office from the operation of the Acts regulating and restricting the issue of notes in the United Kingdom, and another authorized the Post Office to issue notes for denominations not higher than twenty shillings, and having currency for not more than twelve months from the end of the month in which they should be issued. Instantly notices of opposition were given by Sir J. Lubbock and other members, which so frightened the Government that on last Monday fortnight, when the second reading ought to have come on, Sir H. Selwyn-Ibbetson announced that the Bank Charter Act would not be repealed in favour of the Post Office, that the currency of the notes would be restricted to six months, and that they would be issued for only four denominations—half-a-crown, five shillings, ten shillings, and fifteen shillings.

The motive for the opposition to the Bill will be apparent from the foregoing historical sketch. The measure was regarded by the banking world as a first step to the issue of a Government paper currency, restricted at first to one-pound notes, but soon to be followed, if successful, by others of higher denomination. In short, it was looked upon as laying the foundation for a Government paper currency, destined in time to supersede bank-notes altogether. Of course it was not supposed that the Government had in contemplation a scheme of such magnitude, though possibly, it was thought, some of the Post-Office officials might harbour the notion. In any case, it was contended, the tendency of the measure was such as we have said. If one-pound notes were successful, notes of other denominations would follow, just as one-pound notes were suggested by the Post-Office order. Many economists and statesmen are of opinion that the issue of notes belongs as much to the State as the coinage of money; but it may freely be conceded to the opponents of the Bill that, if the question who is to issue paper currency is to be raised, it ought to be raised explicitly, and not by a kind of side wind. However, as the Bill is now amended, this objection hardly applies. Yet even to the amended Bill the opposition promises to be vigorous. It is contended that a quantity of notes such as is proposed cannot circulate without displacing an equal quantity of gold, and the gold actually in circulation, we are reminded, forms the ultimate reserve from which we should have to draw in a great emergency, such as a serious foreign war. But is not this conjuring up formidable dangers somewhat too lightly? The Bill, as now amended, limits the currency of the notes to six months, and therefore the number of them out at any one time could not exceed half those issued in the year, or, let us say, fifteen or sixteen millions sterling. The largest proportion of them would necessarily be for small denominations, the small orders being by far the most numerous, and indeed those on which the loss to the Post Office occurred. How could notes for half-a-crown and five shillings displace gold? They might drive out silver, and so injure the Mint, but clearly not gold. Gold could be affected only by the notes for ten and fifteen shillings, and these would be so few as to make little impression upon a gold currency estimated to amount to 100 millions—less impression, we should say, than the recent fall in prices, which in three years reduced the gold currency about four millions. It is a more real objection that the Bill would not give the facilities for transmitting small sums which it promises. For obtaining notes for half-a-crown or five shillings the charge would be one penny, for ten and fifteen shillings twopence. Below half-a-crown no note could be obtained, and consequently a person wishing to send a smaller sum would have to transmit postage-stamps, or a Post-Office order of the old kind. For sums between half-a-crown and five shillings he would have a similar difficulty. But he can already send postage-stamps in an unregistered letter for a penny, while, if he has recourse to the Post-Office order, the Bill gives him no relief. In fairness, however, it should be borne in mind that the measure is only an experiment. If it proves successful, the charges may be reduced, notes for other denominations may be issued, and, in short, any change may be made which experience may suggest. It is no valid objection against a plan admitting of development that it does not accomplish everything at its very first introduction.

The history of the Bill which we gave above explains the reasons that recommend it to the Post Office. While the lowest charge for an order was threepence, the system paid; but it ceased to do so when the lowest charge was reduced to one penny. The penny charge had, therefore, to be abolished, although the system developed so rapidly while that charge existed. But the penny charge, it is thought, can be restored up to the limit of five shillings under the proposed scheme, and the twopenny charge can be extended to fifteen shillings. This can be done because the Post Office will have the use of the money paid for the notes for six months, and the profit made in that time ought to more than cover the expenses incurred. Besides, the expenses ought not to be so heavy in the case of the notes as in the case of Post-Office orders. Even in the case of Post-Office orders, the expenses have been considerably reduced since 1875. Much of the journal-keeping previously thought necessary has been dispensed with, and as, at the same time, the minimum charge has been raised to twopence, a profit was secured in the last financial year. But there is one point connected with the working of the proposed postal-note system to which careful attention must be given, or it will land the Post Office in difficulties that will bring it into discredit. If the Bill becomes law, a person may lodge money with the Post Office in London, let us say, and obtain a note for the same amount on the payment of a penny or twopence, as the case may be, and this note he may transmit through the post to a parent, or child, or other correspondent, resident, let us suppose, in the Orkneys or in Arran Island. To this correspondent the note is payable. Others may do the same in Manchester, Liverpool, and Glasgow. In the same way notes may, and doubtless will, be transmitted to the Highlands and the wilds of Connemara. Thus the Post Offices scattered through the most remote parts of the United Kingdom will constantly owe money to unknown persons on notes payable on demand. Letters of advice are out of the question, because the object of making the notes current for six months is to reduce the clerical work, and, besides, it is impossible to foresee when the notes will be presented. It will be necessary, therefore, for each Post Office throughout the United Kingdom always to keep a cash reserve. Undertaking banking business, the Post Office, in fact, will have to act like a bank. And as it has branches in every town in the United Kingdom, it will have to take care that none of those branches are forced to close their doors. The necessity of doing this will diminish the profits of the new business, but to what extent experience alone can tell.

REVIEWS.

MASSON'S LIFE OF MILTON.—VOL. VI.

THE preface to the concluding volume of Professor Masson's great work breathes a spirit of tempered self-complacency by no means unbecoming in one who has at last brought safely into port his huge argosy, which certainly beyond all cavil "overpeers the petty traffickers" of contemporary biographical literature. We can only congratulate the author upon what has indisputably proved the "faithful fulfilment of a large design," while following our own inclination in touching as slightly as possible on the "flaws of mechanical form" which, in the opinion of the person who ought to know best, "revision might amend." Mr. Masson has deliberately chosen and consistently carried out a method of narrative not exactly new in itself, but probably never before attempted on such a scale, or executed with so extraordinary an assiduity. Thus, in the present volume he divides the last fourteen years of Milton's life into three sections; the year of the Restoration itself, and the two subsequent periods of about equal length, marked off from one another by the fortunate coincidence of two events, respectively of the highest significance—namely, the fall of Clarendon and the publication of *Paradise Lost*. In accordance with the general plan of the work, in each of these three sections a chapter of Milton's biography is preceded by a survey of the history of the time, accompanied, except in the instance of the year of the Restoration, by a review of their literary history in particular. Substantial completeness and (what previous volumes had not so invariably accustomed us to) a fair regard for proportion are noticeable in nearly the whole series of sections and sub-sections. It is only in his observations on the dramatic literature of the second septennium of the reign that its critical annalist seems to claim the right of ceasing to be exhaustive, and there are few readers who will not feel grateful for this timely abstinence. In general, few facts or names calling for commemoration slip through the net; and the copious index to the whole work which is promised will, if well executed, render it a work of reference of unique value for students of the period which it covers. For the rest, the principle having once been admitted that things contemporaneous in the life of a nation—or of two nations so closely related to one another as England and Scotland—are rarely without some bearing, direct or indirect, upon one another, the uses of Mr. Masson's method are undeniable. At all events, as a philosopher has observed, "things contemporaneous are consentaneous," and the completeness of the picture enhances the instructiveness of any part of it. Yet this method may be misused so as to become tedious, if not absolutely misleading. Thus it is tedious, though probably not altogether useless, to have to contemplate the authors alive at the Restoration in groups of men under sixty and over fifty (*alias* "the authors of Davenant's own wave," *alias* "Davenant's coetaneans"), of men under fifty but over forty, and so forth; but unluckily Mr. Masson has caught from the venerable father of the school to which he belongs the trick of exhibiting the scaffolding of his literary edifice as one of its most prominent decorations. Superfluous nothing can fairly be called that is *once* told in this volume; nor are we tempted to express an impious wish that any of the records, either of Scottish or of English affairs, which are here put to so good a purpose, might have gone down with the "eighty-five hogsheads of old Scottish history" which, as it seems, lie under the water somewhere off Berwick to this day. On the other hand, there seems reason to protest against the re-introduction, as of matters which might or might not have reached Milton's ears or impressed his mind in a particular period of his *biography*, of transactions already previously discussed as *history*. Possibly this inconvenience may not be altogether separable from Mr. Masson's conception of his work. The same cannot be said of his eccentricities of manner and style, fewer perhaps in number than of old, but in which we cannot altogether suppress a fear that he takes a secret joy. We are thin-skinned enough to feel offended by the description of King Charles II. as "this lazy, coffin-faced lout"; while it seems to us a mere parody on fine writing and impressive moralizing to conclude a very entertaining account of the "lout's" coronation as follows:—

> There could be no fireworks that night [by reason of the storm], and London and Westminster had to be content with bonfires. And, through the night, on the roof of Westminster Hall, by the flashes of the lightning, one might have discerned, as distinctly as though the whole ceremonial of the day, the three fixed black poles, with the three skulls on their tops [Cromwell's, Bradshaw's, and Ireton's]; and the anointed and crowned King had gone home to Mrs. Palmer; and a venerable archbishop, and a bevy of good and learned bishops about him, had done their blasphemous uttermost; and is it God or Mephistopheles that governs the world?

As we indulge the hope that, after all, Mr. Masson's faith is not shaken at its base, we can only suppose that, though there were no fireworks on the night of the coronation, he was determined that his narrative of it should not conclude without some. Elsewhere he contents himself with sending up a solitary rocket of startling suddenness. On the question as to how far Clarendon was aware of Charles II.'s conversion to Roman Catholicism we read, and rub our eyes as we do so, "But Clarendon cannot have known, Clarendon *would have to shoot himself had he known*, the full state of the case."

But although Mr. Masson may not be an elegant historian, he is what is of infinitely greater importance—a singularly accurate, and therefore an altogether trustworthy one. It is not for nothing that his narrative bristles with figures, and that he is for ever distributing his accumulations of facts into groups and tables. We can sympathize with him in his complaints as to the absence of dates in Clarendon, which exceed in their bitterness Mr. Carlyle's reprobation of the indexless Ranke. Mr. Masson himself has the invaluable habit of verifying his statements before he makes them; and in consequence we believe that he speaks, as usual, according to book when remarking in his preface that "the errors of fact that have yet been pointed out in the previous volumes are few and slight." He adds that he is "aware of some that have not been pointed out." In his present volume he has incidentally corrected one or two; perhaps the index volume may give a complete list of reconsidered points. At the same time it is satisfactory to have to deal with an author who does not follow the fashion which seems to be gaining ground in Germany of rewriting a book during publication. There are only a few queries as to statements of fact which the present volume has suggested to us. We will not undertake to revive the question which Mr. Masson revives (we must say, after no very charitable fashion) as to the fidelity of Queen Henrietta Maria to the memory of her royal consort. But even Clarendon—and it occurs to us that it might have fared better with the poor little Queen's reputation, had Clarendon been better disposed towards her—might have set Mr. Masson right as to her services to the living King. It is hard that she should be spoken of as returning to England in 1660 "on her first visit to England, since she had left her husband to his fate there in February 1641-2." We had always thought she came back in 1643, and was of some use—and some trouble—to her husband in that and the following year. Again (to pass to literary lives), is it correct to say that, after the Restoration, Cowley's lot, "as far as Charles and the Court were concerned, was to be respectful neglect." Johnson, in his carefully written Life of the poet, mentions the disappointment which suggested to Suckling the considerate reference to "Savoy missing Cowley," but likewise states that, though his retreat at Chertsey "was but slenderly accommodated, yet he soon obtained, by the interest of the Earl of St. Alban's and the Duke of Buckingham, such a lease of the Queen's lands as afforded him an ample income." Of a very different "man of letters" (under which guise we observe he has recently made his appearance), Bunyan, we notice that Mr. Masson unhesitatingly asserts that he had been a "Parliamentarian soldier"; Mr. Froude has, we think, succeeded in throwing at least considerable doubt on this popular assumption. Two other assertions of Mr. Masson's which we should hesitate to accept perhaps reduce themselves to matters of opinion. They concern two works at the opposite poles of dramatic literature. We do not share the belief that "the fatal blow" was inflicted on "Heroic" plays by the *Rehearsal*. To Mr. Masson's interesting criticism on *Samson Agonistes* we desire to pay all deference; but without yielding even to him in admiration of the beauties of the poem, we should hesitate to describe it, with special regard to its lyrical portions, as a "consummate specimen of English verse."

Upon the whole, the Restoration age has never found a severer critic than this both conscientious and generous historian of its earlier years. For, differ though we may from several of Mr. Masson's conclusions—and even perhaps in some measure from the tendency of their sum total—we should be loth not to acknowledge the liberal breadth as well as the solidity of the grounds on which his judgments are founded. We do not expect him to judge Dryden, for instance, with so kindly an eye as that which all but winks at the scurrilities of "honest Andrew Marvell"; but we rejoice in the ready recognition of the real merits of the representative author of the Restoration, which the present age may be almost said to persist in ignoring. Most assuredly it is not too much to say of Dryden that "for one thing, he was evidently a new master in the art of writing English." Dryden has been reproached with arrogance for declaring, in words combining self-satisfaction with courtliness, that it was in the reign of Charles II. that English first began to be spoken and written with propriety. But there is some truth in the assertion as well as some arrogance. The prose style to which modern English has on the whole adhered, and which is almost as far removed from that of Milton as from that of the Elizabethans, formed itself in the Restoration age; and Burke acknowledged his teacher in Dryden. Of Butler again and the much-vaunted *Hudibras*, Mr. Masson, whom the indisputable merits of that burlesque do not blind to its characteristic defects, offers what seems to us a remarkably well-balanced judgment. The entire literature of the Restoration age, as compared with that of the Civil War period preceding, he has perhaps rather too persistently sought to depreciate on statistical grounds. In the first place, we are not aware in whom the harmless, and, as Mr. Masson allows, necessary phrase, "the literature of the Restoration," has fostered the conception of "a fresh outburst and abundance after a period of sterility or poverty." In the second place, the statistics of the number of books published or entered on the Registers furnish in any case a doubtful guidance, as Mr. Masson himself, by noticing the fact that political and religious pamphlets formed a great part of the Commonwealth literature, very candidly admits. But we do not scruple to go further and to question whether, even if the statistics of works *composed* in the one and the other period could be

* *The Life of John Milton: Narrated in Connexion with the Political, Ecclesiastical, and Literary History of his Time.* By David Masson, &c. Vol. vi. 1660-1674. Macmillan & Co. 1880.

perhaps, the result might not prove a delusive one. For what would it boot to reckon the later plays of Shirley among the productions of the Commonwealth, and some of the earlier writings of Bunyan among the fruits of the Restoration? We are very far from denying, and we think that Mr. Masson has done most excellent service in insisting upon, the fact that Puritanism had its intellectual as well as its moral side, and that the phases of its productivity were many. On the other hand, with or without Professor Henry Morley's tables of dates before us, we claim for the Restoration age the character which has usually been ascribed to it of an age of intellectual activity. It was not the less so because it was one of preparation as well as of achievement. If we refuse to derive our conceptions of Puritanism from Butler's caricatures, and to think of the Presbyterians and Independents of the Commonwealth as a series of Sir Hudibrases and Ralphos, neither need we be deterred by the same author's gibes, or by the self-abuse in which no age has more liberally indulged, from acknowledging the vitality of many of its growths. We can see no "sycophancy" in ascribing the foundation of the Royal Society to the period when it occurred, and accordingly regarding it "as one of the institutions of the Restoration"; that it had its origin in earlier ideas is a matter of course. If the Restoration may claim for itself the later years of Hobbes, by whose philosophy it was so much influenced, may it not also claim the youth of his lineal successor? If Hobbes was the predecessor of Locke, Pearson, whose famous book made its appearance in the year before the Restoration, was the forerunner of Barrow. We chiefly remember Barrow as a theological controversialist; but how enduring was the influence which he exercised upon the studies of one of our great Universities, as to which the educational philosophers of the Commonwealth had uncommonly few successful reforms to register. If in the polite literature of the Restoration the drama asserted a preponderance which is upon the whole to be regretted, it far from engrossed the attention of the literary public. Perhaps Mr. Masson has hardly done justice to the *verve* and ingenuity of Dryden's first important non-dramatic poem; on the other hand, he has convincingly shown that it was not by Dryden alone that *Paradise Lost* itself was welcomed on or shortly after publication. It is worthy of notice that in the preface to his rhymed adaptation of *Paradise Lost* as an opera, Dryden incidentally reproves the false critics who have presumed to censure Milton for his choice of a supernatural argument; and other illustrations might easily be brought to show how the Restoration age was neither devoid nor incapable of sympathy with a sublime poet or sublime theme. While, by the way, on the subject of Milton and Dryden, we may notice the curious coincidence that it was to the question of Dryden's brother-in-law, Sir Robert Howard, "What made him side with the Republicans?" that Milton made the half-humorous answer:—"Among other reasons, because theirs was the most frugal government, for that the trappings of a monarchy might set up an ordinary Commonwealth." This recalls the famous description of the economical Radicals in *Absalom and Achitophel*:—

These were for laying honest David by
On principles of pure good husbandry.

But we are not writing the apology of the Restoration age; nor has Mr. Masson at all taken up the position of delivering a general indictment against it. Generalities are, fortunately, not his foible, though the temptations in this direction incidental to his theme must be allowed to be considerable. The preciseness of his narrative on such heads as the treatment of the Regicides after the Restoration would alone give his book a solid value among recent historical authorities on the period. A careful account of this particular episode certainly suggests grave reflections on the haphazard nature of all legislation into which the personal element largely enters. It should at the same time be remembered that in this matter the Convention Parliament showed itself more Royalist than the King, just as its successor showed itself much more enthusiastically devoted than the Supreme Governor of the Church to its supposed interests. Illogical and unjust as were some of the exceptions actually made to the Act of Indemnity, some of those proposed, but not carried, were more extravagant still; thus the irrepressible Prynne actually proposed Richard Cromwell! The treatment of Milton himself, which of course Mr. Masson discusses at length, is by no means easy of explanation. It was while the Lords and Commons were at issue as to the amendments of the former on the Indemnity Bill, that the proclamation was issued for the arrest of Milton and Goodwin as having in writings of theirs justified the execution of King Charles I.—the former in his First *Defensio pro Populo Anglicano* and *Eikonoklastes*, the latter in his *Obstructors of Justice*. Both, as is well-known, escaped with their lives; but what is strange is that while Goodwin was ultimately among the eighteen persons excepted from the Act to the extent of perpetual incapacitation, Milton was in the end subjected to no penalty whatever. We agree with Mr. Masson that the probability of that "fine and faithful man," Marvell, having exerted himself in Milton's behalf, and the tradition that Davenant gratefully saved a life for a life, will not suffice to account for the escape of the great literary champion of the Regicides. The same tradition, however, as Mr. Masson points out, which records the successful efforts of Davenant, likewise mentions a brother-in-law of Monk, Sir Thomas Clarges, and the king-maker's right-hand man in the Government, Secretary Morrice, as having "managed matters artfully" for Milton; and Mr. Masson suggests with much probability that Arthur Annesley, who afterwards, when Earl of Anglesey, is found on intimate terms with Milton, may have exerted his great influence in the House of Commons. But the assumption that Hyde must have consented to the proposal of sparing Milton seems to us uncalled-for, since there is no evidence of any intervention in the details of the Indemnity business; in which case all kindly speculation as to his motives becomes useless. Not the least curious point in the matter certainly is, as Mr. Masson shows, the omission of all mention of Milton's *Tenure of Kings and Magistrates* in the proclamation, though the publication of that tract followed within a fortnight after the act of the King's execution itself.

No side of the history of the fourteen years following upon the Restoration is fuller of interest than the ecclesiastical, and none has been more lucidly and instructively treated by Mr. Masson. The ecclesiastical questions of the days of the Clarendon Code and the Test Act were indeed different from those which had exercised Milton as the upholder of Vane's pure Voluntaryism against the less intransigent policy of the great Protector; but we should think Mr. Masson not far wrong in supposing him, on the eve of the ejection of the Presbyterians from the Church, to have had his "speculative consolations." Much of the sympathy which has been bestowed upon the martyrs of Nonconformity on the occasion of the Ejection is justified by the general hardship of the case, and much of the indignation expended upon it by its injustice; on the other hand, there are two points of view which are not usually made prominent in commemorations of St. Bartholomew's Day. We refer partly to the readiness of a large number of Presbyterians to accept a modified Episcopal Establishment, and more especially to their willingness to "achieve at the same time the other desirable end of turning out the Independents, the Baptists, *et hoc genus omne*." That the King's assent to the Uniformity Act should not have been forgotten at the time of the issue of his Declaration of Religious Indulgence is, however, explicable enough. Mr. Masson recalls the fact that, even before the issue of that unfortunate Declaration—which provoked the Test Act—

Congregational and Presbyterian ministers in considerable numbers had applied for the King's licences for their tabernacles and had received them. There is even evidence that some of the more eminent Nonconformist ministers were offered and accepted temporary Government allowances of 50*l*. to 100*l*. a year for the exercise of their pastoral services among their flocks. This curious fact can bear no other construction than that it had occurred to Charles and some of his advisers that they might go beyond the mere offer of future toleration or indulgence for dissent, and might venture cautiously on some attempt to re-open the greater question of the constitution of the Established Church itself by an experiment in the direction of concurrent endowment.

Concerning Milton's own views on ecclesiastical matters, Mr. Masson, after his closing survey of the posthumous *Treatise of Christian Doctrine*, comes to a conclusion which it will be difficult to gainsay, that he "cannot be identified with any sect in the sum-total of his opinions at the last."

We should have liked to urge a plea in mitigation of Mr. Masson's rather summary verdict upon the foreign policy of Charles II., "vendidit hic auro patriam." But space fails us for this and for many other comments on Mr. Masson's historical narrative. Of his literary criticism contained in this volume, so far as Milton is concerned, much has already been published in the admirable library edition of the *Poetical Works*. What seems to us the most valuable part of the remarks on *Paradise Lost* is the demonstration of the consistent Ptolemaic cosmology of the poem. Mr. Masson fully justifies his description of it as a new cosmical epic, and thus duly solves the sufficiently vexed question as to who should be regarded as its hero. But we must refrain from dwelling further on this division of Mr. Masson's multifarious labours. The satisfaction with which he looks back on their completion will be shared by a large and varied body of students; for this *Life of Milton* is a book which the present generation will hand down with pride to its successors.

VAN LIMBURG-BROUWER'S AKBAR.*

A REMARKABLE book, in its original form accessible only to a limited number of readers, is, by the translation which now appears, made the possession of the English-reading world. *Akbar* belongs to the same class of writings as the series of brilliant studies from antiquity in the form of novels which Dr. Ebers has produced in the last few years. Like them, it is an historical romance and something more. The period selected for illustration is not fixed upon solely on account of its fitness for artistic treatment, though in this case historical importance and attractiveness from the artistic point of view coincide very happily. The splendour of Akbar's reign, the large-minded beneficence of his rule, and his ambition, unparalleled in the Oriental world, of founding a new empire of reason co-extensive with the power of his arms, afford a field for the romance-writer to which no objection can be taken save that it is too vast. Nor is the execution unworthy of the subject. Limburg-Brouwer's novel deserves to take high rank on its own artistic merits; and, when we consider how few are the men of letters who have succeeded in historical romance, there is something really surprising in the excellence attained by this one, the solitary work of fiction of an Orientalist.

* *Akbar; een oostersche roman*. Door Mr. P. A. S. van Limburg-Brouwer. Tweede druk.'s Gravenhage: Martinus Nijhoff. 1873.

Akbar: an Eastern Romance. By Dr. P. A. S. van Limburg-Brouwer. Translated from the Dutch by M. M. With Notes, and an Introductory Life of the Emperor Akbar, by Clements R. Markham, C.B., F.R.S. London: Allen & Co. 1879.

Such a success, however, is not unique; for we are reminded of Mr. Gifford Palgrave's equally solitary and brilliant *Hermann Agha*, which may without inaccuracy be classed as of the semi-historical kind. In all such books a certain interest is presupposed on the reader's part beyond the mere desire to be entertained with a moving story. But, if this be granted, nothing is wanting on the author's part to sustain the interest to the end. The plot is well designed, the action well conducted, and the dialogue, if it has not the lifelike stamp of the great masters of fiction, is appropriate, simple, and dignified. The style, like that of most good Dutch writers, is clear and straightforward; the translation hardly does justice to the original in this respect. The cumbrous and involved periods which in Germany are constantly inflicted on the reader even by authors of good repute have never found favour in the Netherlands in modern times. No attempt is made at introducing minute local colour in either description or dialogue; in fact, it is as obvious in reading *Akbar* that the narrator, though a master of Oriental literature, neither has seen nor pretends to have seen the East himself, as it is in reading *Hermann Agha* that we are being led through scenery thoroughly familiar to our guide. There are introduced, however, some very felicitous translations of Sanskrit poetry, showing a flexibility of verse and a power of producing unusual effects which one is not accustomed to associate with the Dutch language. In the English these passages are represented partly by Mr. Griffith's and partly by Mr. Edwin Arnold's versions.

The hero of *Akbar* is Siddha Ráma, a young noble of Kashmir, to whom we are introduced as he is setting forth to take service with the Court at Agra, and visiting on his way a hermit known as Gaurapada (changed by the translator, for some unexplained reason, to Gurupada). This hermit is in truth a prince who has preferred voluntary exile and oblivion to exposing his country to the risks of civil dissension in the face of a powerful neighbour. Gaurapada has a tame tiger, who seems to us the greatest improbability to which Limburg-Brouwer has committed himself. The tiger is, however, necessary to the story, as at a critical moment he saves his master from the hands and the cord of a Thug commissioned by Gorakh, the evil genius of the romance. This Gorakh is a priest of Durgá, revered by the people as a saint, commanding the services of devoted and unscrupulous followers, and using his position as an engine of conspiracy; and his figure is one of the most strikingly drawn in the book. His name is apparently taken from one of the countless appellations of Durgá's mightier consort Śiva. The intrigues carried on by Salim, who afterwards reigned as Jahangir, against his father Akbar, supply Limburg-Brouwer with an historical plot on which, in an altered sense of the word, the plot of his romance depends. The head and front of the conspiracy, and Gorakh's closest ally, is one Salhana, uncle to Siddha, and Governor of Allahabad. Siddha is betrothed to his daughter, Irávatí, who is completely innocent of these plottings, and is intended to realize for European readers the type of heroic womanliness presented in the classical poems of India. The conspirator's agent at Agra is the wife of Faizi, the brother of the statesman and scholar Abú-'l-Fazl, and himself a distinguished man of letters (the two brothers are historical persons, and as to them Limburg-Brouwer has, besides inventing the incidents of their relations with Siddha, only taken a few excusable liberties with dates). Abú-'l-Fazl and Faizi both show every friendship to Siddha on his introduction to the Court; meanwhile he is sought out by Faizi's wife, not knowing who she is, and drawn into a guilty intimacy with her. The reader who has any taste left for the old-fashioned, and—let us say it without any disparagement—frankly artificial school of historical romance will not need to be told more. Evidently we have here all the elements of a stirring and complicated plot. Siddha, after thus having become, under a strange and fatal temptation, false at once to his betrothed, to his friend, and to the wise and generous ruler to whom he has pledged his allegiance, at the end redeems his honour and is restored to happiness; but we shall not disclose the manner in which it is effected. We will only add that there is a further complication in the shape of a passion on Salim's part for Irávatí, and that she not only succeeds in humbling his audacity, but makes an impression on him for good, which is unfortunately not to be traced in anything that history records of the real Jahangir. The foot-note in which Mr. Clements Markham describes his career is a pitiless comment on the deliberately softened statement in Limburg-Brouwer's text, which, after all, is at least as much justified by artistic necessity as Sir Walter Scott's picture of Richard I. in the splendidly unhistorical pages of *Ivanhoe*.

In addition to the romance proper, there is a speculative vein running through the book which gives it a particular attraction for philosophically minded readers. This finds its scope in discussions between Akbar and the Jesuit missionaries, set off by the denunciations of the fanatically orthodox Mahometan Abdul Kadir (another real person, who composed a history of the time, still extant), and in the conversation of Akbar and his intimate counsellors on the project of establishing a new and comprehensive form of religion; for which, however, he seems to have purposely chosen a name (Tauhíd-i-Iláhí, the unity of God) conveying nothing unfamiliar to orthodox Mahometans. The point of view of an enlightened Brahman is represented by Siddha's teacher Kullúka, who is admitted to these conferences. In work of this kind it is naturally difficult to avoid making the persons of the story the vehicles of thoughts and expressions which are familiar, not to say possible, only to modern and Western thinkers. On the other hand, Eastern speculation had in Akbar's day long since attained its highest developments in both India and Persia, and partly anticipated ideas commonly supposed to be newer. Akbar's philosophic turn of mind is in any case an undoubted historical fact; and there is no great breach of probability in Limburg-Brouwer's manner of using it.

The introduction and occasional notes added by Mr. Clements Markham are excellently fitted to make the text clear and carry out the author's purpose; they give necessary explanations with sufficient fulness to be interesting, and without running into tedious excrescences. Brevity has perhaps been too much studied in the notes on Hindu philosophy, which seem to us not likely to convey any distinct ideas to a reader knowing nothing of the subject beforehand. We wish it were possible for us to give as unqualified commendation to the English rendering of Limburg-Brouwer's work itself. The translation is flowing and spirited enough, and reproduces the general effect, but it cannot be called accurate. "M. M.'s" version seems to have been made under pressure of other occupations, or in some way under conditions excluding due attention to the exact meaning of the original. We have been hardly able to find a couple of pages together free from errors of various degrees in grammar or construction. Sometimes they do not practically affect the sense, but many times they spoil the point of a passage. Thus, at p. 6 we read, "Before either Kullúka or the servants could hasten after him, they saw him draw rein," &c. It should be, "Forthwith, and even before Kullúka, one of the servants was hastening after his young master, when he saw him," &c. Here no great harm is done. But presently, at p. 10, the hermit Gaurapada is made to say to Siddha, who puts his hand to his dagger at the approach of the tame tiger, "Leave that plaything in its place. Do not injure Hara" (the tiger's name). What he does say is, "Leave that plaything in its place. You would not hurt Hara much with it." Again, at p. 16, Kullúka begins to tell Siddha the story of the mysterious hermit's life as follows:—

> "He was once a king."
>
> "How now," said Siddha, a little disturbed, "are you going to tell me a tale from Somadeva, like those I heard so often from you when I was a little boy?"

This is unintelligible. Why should Siddha think he is being put off with a trivial fairy tale, if the Brahman opens at once with a new and startling piece of information? But Limburg-Brouwer was a better workman than this. Kullúka really says:—"Once on a time there was a king" ("Er was eens een koning"). It looks very much as if the translator had confused the Dutch *er* with the similarly written High-German pronoun. And, by the way, the note at p. 242 is mistaken in giving *Ausbreitung* as the German equivalent of *uitgebreidheid*—that is, extension in the philosophical sense. Philologically it is the nearest High-German word, but it has not the same meaning. The proper term is *Ausdehnung*. At p. 77 Siddha is speaking with Akbar, whose person is as yet unknown to him, concerning Akbar himself, and Akbar says in the English:—"*I know him, and all is not so well as I could wish*, and I agree that he is ambitious"; which would be pointless and clumsy. Limburg-Brouwer's text says:—"I know him more or less, *but not so well as I should like*," &c. At p. 111, Gorakh, the priest-conspirator, addresses the following extraordinary salutation to the hero:—"The unworthy servant of Siva's holy consort greets thee, O Moral Force." The original is quite clear to this effect:—"The unworthy servant of Śiva's holy consort, the infinite Power that dwells in him, salutes you." Shortly afterwards the same person is made to say:—"Think that the mighty Goddess to whose service all my feeble strength is devoted not only protects but destroys also, and that *there is no hope of mercy or salvation for him whom, through her priests, she has chosen out for her service and who has turned from it.*" Here is a considerable departure from the true sense, which is thus:—"There is no hope of mercy, no chance of rescue, to him whom by the mouth of her priests she has once pointed out to her faithful as a chosen sacrifice"—*i.e.* whom Gorakh has determined to put out of the way, and named to his followers as a victim destined for the goddess.

We have taken sufficient instances up and down the book to exclude the possibility of our having merely lighted on occasional slips; but it would be wearisome to produce more. We are aware that, for one reason or another, accurate translation from modern languages is a thing very seldom to be met with. But the reason is obscure to us. Mistakes such as we have cited would seriously diminish in the eyes of an Oxford or Cambridge examiner the value of a translation at sight from previously unknown passages of Greek or Latin authors; and we cannot help thinking the avoidance of them a thing fairly to be required by the public from those who translate to please themselves, and with abundant opportunities of information and correction. Their presence is especially annoying when the work otherwise bears marks of real interest in the subject, and desire to do it justice. However, the novel-reading English public is not critical, and is most unlikely to turn to *Akbar* in the original. We have all the more felt bound to show, in common justice to the memory of Limburg-Brouwer, that he is not answerable for everything that appears in the translation.

THE MUNSTER CIRCUIT.*

MR. O'FLANAGAN has been much exercised in mind by the dearth of forensic literature. The world has been fairly supplied with "forensic speeches, biography, and law," but not with what he calls "forensic literature." Forensic literature serves apparently a very high moral purpose. Like history in general, it inculcates, we learn from Mr. O'Flanagan, how, "by observing the result of certain rash or criminal acts, to avoid their commission." We find it difficult to elevate our minds to the level of this high moral purpose of the present volume; and even the author is evidently oppressed in his earlier pages by a sense of the solemn pledges he has undertaken. In vain do we plod through his chronicles of the Munster Circuit for the first century and a half. They have nothing to do with the humours or morality either of the Assize Court or of the Bar Mess. They are a tedious medley of romance and history, such as would not have misbecome the pen of the late Mr. G. P. R. James. The dulness is illustrated rather than relieved by such humorous remarks as that "Cromwell, during his sojourn in Ireland, went the Munster Circuit."

It is a pity Mr. O'Flanagan should have clogged his volume with this dead weight at its beginning, for when he passes the reign of Queen Anne his narrative brightens. He has some strange stories to tell of the classes of offences tried on the Munster Circuit, which was in these respects only an example of Ireland at large. Abduction, as Mr. Lecky has explained in his history of the last century, was a particularly favourite Irish crime. It was punishable with death; yet Abduction Clubs flourished in many places. Their members swore to aid whomsoever the lot had selected for an heiress's husband. When an opportunity had been found or made, the endeavour was to obtain a semblance of consent by the victim. One contrivance was to place her in front on the saddle, as if it were she, and not the man, who was the abductor. Illogical judges nevertheless forced reluctant juries to convict, and many ravishers were hanged. But, remarks Mr. O'Flanagan, the objects of their persecution "were, from that strange sympathy with crime so frequently found in Ireland, regarded with aversion by the lower orders." There was a sentiment in abduction which conciliated sympathy. There was a similar sentiment on the Munster Circuit in favour of assassination and burglary. In 1754 soldiers had to be sent to arrest one Morty O'Sullivan, who had murdered a man named Puxley. O'Sullivan stood a regular siege. Dislodged by the house being set on fire, he sallied forth and was slain. Two of his servants were hanged as accomplices. One of them wrote the night before his execution an elegy on the death of the murderer his master, in which Irish opinion saw nothing inappropriate. Even a splendid feat of gallantry like the defence of Highfort House against fourteen burglars, which earned knighthood for its owner, John Purcell, made, according to Mr. O'Flanagan, the doer "an object of dislike to the peasantry." Unaided he had beaten off the gang, after killing two and wounding three others. As a result, he was twice in danger of life from Rockites. When another Irish gentleman, Mr. George Bond Low, being shot at, bravely pursued and captured his would-be assassin, Mr. O'Flanagan remarks that "Mr. Low's courage and daring in bringing the miscreant to justice made him very unpopular." Mr. O'Flanagan gives as "a specimen of the law and order on the Munster Circuit towards the close of the last century" another siege sustained against a money-lending attorney, Denis O'Brien, by his mortgagee, a Justice of the Peace, and owner of a house which bore the euphonious name of Clonamuckoge. The Sheriff's men, armed with a Chancery decree, made an entry into the house, and "fired repeated volleys through the boarded ceiling in hopes of shooting the men above." The garrison, however, had prepared for such a case. They had supplied themselves with bullet-proof iron pots, and, taking each of them a stand in one of these, returned the fire with deadly effect. The attack was consequently defeated; but O'Brien was subsequently put in possession by troops and cannon from Clonmel. A yet more Irish feature in the incident is that it was discovered that the interval allowed for redemption after the mortgage-money was due had not elapsed. The result was that O'Brien was put out of his hardly-acquired property by ejectment. Another unsatisfactory instance of the manner in which popular sympathy, though in this case less unreasonable, has always been allowed to interfere with Irish justice, is Mr. O'Flanagan's account of the trials of Lord Kingston and his son, Colonel King, for the murder of Colonel FitzGerald. FitzGerald was the illegitimate son of Lady Kingston's brother, and had been brought up with her children. Though himself married, and the trusted friend of the whole family, he seduced Lady Mary King. When at length she had been rescued from him he was detected in a new plot to get her into his power. Lord Kingston shot him while he was struggling with Colonel King. The terrible provocation and the excitement would probably have reduced the Earl's offence at most to manslaughter; and his son might have been acquitted altogether. Both, indeed, were, in fact, acquitted. It was, however, not on a fair view of the merits of their cases, but from the scandalous circumstance that "the witnesses to sustain the prosecution were not to be found." The same perverted sentiment may be traced in a pathetic legend associated with the trial of Scanlan at Limerick for the murder of the heroine of Gerald Griffin's novel, *The Collegians*, and Mr. Boucicault's play, *The Colleen Bawn*. Scanlan, who was a gentleman, was permitted to ride in his own carriage to Gallows Green. But "the horses refused to stir. Neither blows nor entreaties could persuade them to draw their master to the place of execution." The horses of one of his tenants which happened to come by with a load of hay were substituted. They, too, "on crossing Balls Bridge lay down, and no whip or effort could make them move." In this particular case the popular sympathy seemed all on the side of Scanlan's victim. Yet there was enough left of Irish pity for a dastardly murderer to call up the fiction of a protest by the brute creation against an act of ordinary justice.

When a jury could be persuaded to convict, the law made the most of its opportunity. Prisoners were cooped up, on the Munster Circuit, in the most frightful gaols. Mr. O'Flanagan describes how in the South Gaol of Cork towards the end of the last century even debtors were obliged to drink salt water for three months, "their pumps being for a long time dry." When a convict had been hanged, the law was not content till his head was fixed on an iron-spike, and exposed for a public warning. If a party of men had committed a capital crime all that could be caught were executed. Thus, for the shooting of Colonel Hutchinson at Macroom, by a number of burglars whom he was resisting, not one, two, or three, but nine men suffered death. Mr. O'Flanagan tells a striking story in regard to these executions. As the condemned were riding pinioned to the gibbet an old woman threw herself before the horses, screaming out in Irish, "John Duggan, John Duggan! you owe me sixpence." John Duggan, though fast tied, contrived to jerk out of his pocket a sixpenny piece to her. Her reply to a reproach by the crowd for dunning a man on his way to be hanged, was, "Troth, then, shure I wouldn't be afther letting it rest upon his sowl." If, however, justice was determined to have good measure at the gallows' foot, it did not always take sufficient care of the machinery. In 1766 a tailor, Patrick Redmond, was hanged at Cork for robbing a house. But "an actor named Glover by means of friction and fumigation succeeded in restoring animation." Redmond, according to Gibson's History of Cork, was "the third tailor who had outlived hanging during two years." He got tipsy in the course of the day. To the horror of those who had seen him hanged in the morning, and had not heard of his resuscitation, he made his way at night on to the stage to thank his deliverer. Mr. O'Flanagan reassures anxious sympathizers by mentioning that "it is not stated he was retaken."

Clare, Limerick, Kerry, and Cork, which constitute the Munster Circuit, were, likely, as may be inferred from the picture Mr. O'Flanagan draws of their degree of obedience to law, to attract abundance of legal ability. Among the Circuit's earlier leaders were the two John Fitzgibbons, father and son. The father was at first refused a call by the King's Inn for the dire crime of having, while studying in London, committed a contempt in publishing Select Reports of Cases before the Courts at Westminster. The Irish Lord Chancellor and Lord Chief Justice, however, interceded for him. He loved money. A client once apologized for the smallness of a fee on the plea that it was "all he had in the world." "Oh," said Fitzgibbon, "as it is all you have in the world, why I must take it." His second son became Lord Chancellor, and is still remembered with popular hatred as Earl of Clare. In 1775, three years later than Fitzgibbon's call to the bar, a more famous though less prosperous barrister commenced his career. In that year Curran was called. After a common fashion he has often been spoken of as a briefless barrister of long standing. On the contrary, as Mr. O'Flanagan proves from his fee book, he made in the first year 117*l.* 1*s.* 4*d.* An English barrister would account that a very promising beginning, even though his income should not mount, like Curran's, by the fourth year to 1038*l.* 10*s.* Curran and Fitzgibbon were keen enemies. On one occasion they fought a duel. Fitzgibbon, when Chancellor, retaliated by depriving Curran practically of all business in his court. Curran estimated his loss by the Chancellor's hostility at 30,000*l.* Another and much more unfortunate victim to Fitzgibbon's tyranny was a certain Baron Power. Mr. O'Flanagan makes the remarkable observation that, "as a general rule, judges do not die by their own hand." Neither, fortunately, do tailors, or grocers, or shoemakers, as a general rule. He says that "the legal annals of Ireland give only one instance of suicide by a judge." This single instance is that of Baron Power. The Baron, besides his seat on the Bench, by a strange abuse of patronage, held also the post of Usher to the Court of Chancery. The Usher's remuneration was the interest he was allowed by custom to draw from money lodged with him to abide the results of decrees. A decree having been made for payment out of Court of interest as well as principal, he refused compliance. Thereupon the Chancellor ordered his attendance in the Court at its next sitting to account. The judge in vain remonstrated against the indignity. Lord Clare replied that he was dealing, "not with Baron Power, but with the Usher of his Court." The next day being Sunday, the unfortunate Baron had a respite. He employed it in drowning himself. Curran did not let himself be shuffled either out of life or out of wit by his ungenerous rival. He could return stroke for stroke; and Lord Clare's demerits are embalmed for ever in Curran's irresistible sarcasms. Curran's law was not always his own. Mr. O'Flanagan states that his best legal opinions were only signed by him, being in fact written by Charles Burton, originally an English solicitor's clerk, whom he had persuaded to settle in Ireland, and

* *The Munster Circuit; Tales, Trials, and Traditions.* By J. R. O'Flanagan. London: Sampson Low & Co. 1880.

be called to the Irish Bar. "Carry the brief to Mr. Burton, but I will thank you for the fee," was the answer of Curran to an attorney who found him dining and joyous. But no other than himself was answerable for the outbursts of invective and pathos which by turns melted and withered. Flowers, however, culled from Curran's speeches have a somewhat tawdry air now. Mr. O'Flanagan might have saved himself the trouble of printing long paragraphs of burning oratory in a suit for damages by an injured husband against Lord Headfort. They were eloquent once; to us they breathe chiefly of pounds, shillings, and pence.

Some specimens which Mr. O'Flanagan has preserved of O'Connell's extraordinary power as an advocate have more reality about them. He understood his countrymen; "and who can compete with a Kerry man"? But he also had a very competent knowledge of law. For several years he went the Munster Circuit, possessing the great advantage of having relations in almost every county. Usually at Limerick, says Mr. O'Flanagan, "he had the dock to defend, one of the officers in Limerick Gaol engaging him for that purpose." Probably it is scarcely an exaggeration to say that "he gained the reputation of being the best criminal lawyer in Europe." He showed some of the finest qualities of an advocate in the inquiry into what is called the Doneraile Conspiracy, when twenty-one men were tried on a charge of having plotted the murder of four Doneraile gentlemen. The vicinity of Doneraile was infested with Rockites. The conspiracy was supposed to have had its origin in a desire of the Rockites for vengeance upon Mr. Bond Low, who, as we have already mentioned, had committed the impropriety of capturing a man who had tried to murder him. The Solicitor-General, Doherty, afterwards Chief Justice, who prosecuted for the Crown, appealed to the jury, in fact, to convict for the sake of example. The prisoners were tried in batches of four. The first detachment had for counsel two barristers very ill-fitted to cope with Mr. Doherty. One of them, David R. Pigot, was so far an orator that he was accustomed to "practise attitudes before a cheval glass in his study." But his real skill was in special pleading. The result of the Solicitor-General's impassioned declamation and the gentlemanlike dealing of Mr. Pigot on the other side with the professional informers was that the first four defendants were found guilty by the jury in five minutes. Saturday afternoon had come, and the Court adjourned to the Monday before trying a second batch. The Solicitor-General refused to say who would form it. In any case, the facts and the evidence would be the same as those on which the first four had been convicted, and the prisoners and their families were in despair. There was one hope. O'Connell was known to be at his Kerry home, Derrynane, ninety miles away. William Burke, a brother of one of the accused, rode off at five on that Saturday afternoon. By Sunday morning he was in O'Connell's library. Burke understood O'Connell, as O'Connell understood his countrymen. "The friends," he said, "of the prisoners yet untried for the Doneraile Conspiracy sent me for you. If you don't defend them Doherty will hang them all. There's a hundred guineas for you. If you come they'll be safe; if not, they'll all be hanged." On the Monday morning four other prisoners had been arraigned, and Mr. Doherty had just begun his address to the jury, when, amid "loud and continued cheers, which," according to Mr. O'Flanagan, "vires acquirit eundo," O'Connell strode into the bar seats. By leave of the Court, he eat a breakfast of milk and sandwiches in Court. "On hearing a legal proposition incorrectly stated by the Solicitor-General, O'Connell instantly exclaimed, his mouth half full of bread and milk, 'That's not law,' and the Court decided in his favour." From the moment he entered the Court the tide turned. According to Mr. O'Flanagan, he upset Mr. Doherty's law; he deliberately irritated him out of his lofty air of superiority by mimicking his Anglicized pronunciation; he annihilated his witnesses. One of them naively exclaimed, "It's little I thought, Mr. O'Connell, I'd be answering you this day." The jury which had tried the first four prisoners convicted them in five minutes. The jury which tried the second four acquitted one; on the guilt or innocence of the other three they could not agree in forty hours. There was even a majority of nine for an acquittal. Then they were discharged, one juryman being pronounced in danger of death from gout. The same week a third batch of four was tried, and the jury in five minutes brought in a verdict of not guilty. The Solicitor-General then decided to proceed with no further trials, and the untried prisoners were let out on bail. The three about whom the jury could not agree were tried a second time in 1830, when two were acquitted and one was convicted. O'Connell was not their counsel on that occasion. Considering that on the first trial there had actually been a large majority in favour of an acquittal, the case of the convicted man seems hard. The first four, whose guilt a respectable jury had found in five minutes, had their capital sentences commuted for transportation for life. Clearly there was a gross miscarriage of justice in the case either of the first jury, and of that which was impannelled in 1830, or in that of the second and third juries. The facts and the evidence in all four trials appear to have been the same. The one distinct element in the second and third was the presence of O'Connell.

Other names distinguished in records of the Irish bar occur in Mr. O'Flanagan's pages. There is Sir Toby Butler, who, having pledged himself to a client to drink no wine till the hearing of an important case was over, steeped two hot loaves in two bottles of claret and ate them. There is Chief Justice Bushe, described by John Kemble as "the greatest actor off the stage." There is Lord Norbury with his grotesque extravagances, and Serjeant MacMahon, famous for confused metaphors, who would exclaim to a jury, "I smell a rat, but I'll nip it in the bud." There is Harry Cooper who "had the knack of talking shorthand," and Jonathan Henn, of a lineage of famous lawyers, whose "level language" and honest face convinced jurymen that his side must be in the right. There is Isaac Butt, though Mr. O'Flanagan has nothing worth quoting to say of him. There is Anster, the translator of *Faust*. Anster only once defended a prisoner charged with murder. He got the man off through a flaw in the indictment which a veteran friend pointed out to him. One such client was enough. Sitting up very late the same night he heard a knock, which he answered. At the door stood his client. "Oh! Kelly, is that you?" he said, mentioning by accident not the living, but the murdered man. "I'm not Kelly, plaze your honour," returned the client, "'tis myself is the boy that shot him." But for much which is amusing we must refer our readers to the volume itself. We have no space to tell how, until comparatively recent times, barristers on the Munster Circuit argued not in wigs and gowns, but in morning dress—how, till past the middle of the last century, they rode the circuit, acting as the judges' escort—how ready counsel were to fight one another, or anybody else; and how a Chief Justice, Lord Clonmel, declared *à propos* of duelling that "in cases of a wounded spirit—and a wounded spirit who can bear?—the Court will never interpose its discretionary authority." We have said enough to show that Mr. O'Flanagan has collected abundance of interesting matter, and might well have confined himself to his theme of Bar and Bench sayings and doings.

PERCY'S METALLURGY.—SILVER AND GOLD.*

DR. PERCY has followed up his valuable treatises upon the metallurgy of fuel and of lead by a no less elaborate and exhaustive series of investigations into the origin, the properties, and the treatment of what are conventionally known as the precious metals. So closely allied are the kindred subjects of silver and gold that the two must be dealt with together, up to the point, at least, at which they leave the hands of the scientific metallurgist for separate application to the purposes of decorative art or the exigencies of commerce. It is now more than ten years, Dr. Percy tells us in his preface, since he began to write upon this branch of metallurgy, which he hoped to be able to treat adequately within the compass of a single volume of moderate size. He found it by degrees impossible to compress within these limits a subject which of all departments of metallurgy he justly considers to be the most extensive, the most varied, and the most complicated. The plan of the work has in consequence extended to two volumes, the first of which is now before us. Much of the second volume is, we are glad to hear, already in type, and it is the more likely to be ready for early publication on account of the writer's recent resignation of his absorbing duties at the Royal School of Mines. Such is the poor modicum of consolation to be derived from the withdrawal of the ablest exponent of this branch of science and industry from the post which he has filled for nearly thirty years. The laboratory and school in Jermyn Street, wherein advances of so much value have been made in the processes of metallurgy, and whence so large a band of pupils has been sent forth as practical metallurgists and mining engineers, have been absorbed by the all-devouring octopus of South Kensington. It is not easy to conceive how the important functions of the School of Mines are to be performed in its new home, apart from the collections, models, and other needful accessories to instruction previously at hand in the Geological Museum in Jermyn Street. We can only hope that the vacant chair may be occupied by a successor as thoroughly master of his subject as Dr. Percy has shown himself to be.

Starting with historical notices of silver, Dr. Percy traces this beautiful metal as a medium of exchange as early as the time of Abraham, before which period it had been in use in the East for purposes of ornament to an extent and for a range of time which we are wholly unable to estimate. Specimens of silver manufacture have come down to us which possess the twofold interest of illustrating, on the one hand, the metallurgical knowledge and artistic skill of the epoch that produced them, and, on the other, the physical changes which have passed over the metal during the ages that it has been hidden from sight. For a test of this latter kind Dr. Percy instances a silver ornament brought by General de Cesnola from a tomb in the island of Cyprus, examined by Mr. Church. To this specimen he assigns an age of fifteen hundred years—an estimate which seems strangely modest in contrast with the high antiquity indicated by the archaic style of the sculptured monuments of Cypriote art. We should have preferred seeing the results of the same tests applied to specimens from Hissarlik, Nineveh, or Egypt, for which an antiquity of not far from twice that number of years may with confidence be claimed. This Cypriote ornament, in the form of a crescent, thin at the ends and thicker towards the middle, was, as regards its general mass and surface, extremely brittle, whilst white, metallic, highly lustrous, and uniform; the inner core, existing only in the thicker part of the crescent, being of

* *Metallurgy: the Art of Extracting Metals from their Ores.* By John Percy, M.D., F.R.S., F.G.S., &c. Silver and Gold. Part I. With numerous Illustrations on Wood, mostly from Original Drawings. London: John Murray. 1880.

unaltered ductile metal. The composition of both parts was precisely the same—namely, 94·69 per cent. of silver, 0·41 of gold, 3·43 of copper, 0·28 of lead, and 1·21 of antimony, with traces of arsenic and bismuth. The brittleness of the outer mass forms an interesting proof of a molecular change set up through the course of ages in the original homogeneous metal from without, but not having yet penetrated to the interior core of the ornament. A crypto-crystalline structure had been produced in the fusiform alloy, making it easy of fracture. It is curious that, though a smart blow with a hammer at once shattered it to powder, the brittle mass could, by rolling or gently hammering, be readily restored to its pristine ductile condition. The density of the brittle silver was 9·06, but by rolling this became 10·20. Here was a physical change in a metal caused, it would seem, neither by vibratory nor concussive action, nor by great changes of temperature. We are reminded of the opalescent effects manifested by specimens of glass after being long buried underground. How far, we ask, is the cause of change to be sought in the chemical action of the soil or other surroundings, or in molecular action going on in the substance itself, originally set up by the forces of smelting, hammering, or welding?

An ancient vase of thin silver taken out of brick earth near London was found by Mr. Warrington to be very brittle and highly crystallized, having on its surface a thin layer of chloride of silver. The crystals, it was thought, might have pre-existed, and been merely disclosed by the slow biting or etching action of the chlorine derived from some chloride existing in the soil. The brittleness was removed by heating to redness for a few minutes, the metal becoming compact and granular in structure, and its specific gravity being increased from 9·937 to 9·950. Later on Dr. Percy speaks of experiments made by him upon a silver coin of Edward the Confessor, showing 10·50 per cent. of chloride of silver. In some antique silver vessels found at Hildesheim in October 1868, Schertel's analysis proved that a small proportion of copper had been mixed in the original alloy of silver and gold, and that the first cause of change was the percolation of water charged with chlorides in solution, converting the copper into cupric chloride, which formed with the silver argentous and cuprous chlorides. The cuprous chloride was then reconverted into cupric chloride, and again attacked the silver. The clay surrounding the metal kept the liquid in contact with it, and acted like a filter, so that in time, with little copper, much silver was converted into chloride, forming a thick incrustation upon the vessels. Dr. Percy is of opinion that, even without the copper, chloride of silver would be formed under the conditions stated—namely, the presence of atmospheric oxygen and dissolved chlorides, of which chloride of sodium must surely have been one. Silver coins, he holds, have been more or less converted into chloride of silver by long immersion in sea-water. He gives details of various laboratory experiments on the formation of chloride of silver, a subject of great importance in connexion with the metallurgical processes for the extraction of silver from its ores and certain argentiferous products.

The accompanying formulæ, in accordance with the excellent rule maintained throughout the book, are given in terms of the atomic system of weights now current, as well as those of the older nomenclature. From the chemical properties of silver, which are treated of in the first part of the volume, the author proceeds to the discussion of alloys and ores. In his systematic investigation of the admixture of silver with other metals, he has not limited himself to such alloys as are in familiar use, or the properties of which render them of appreciable value for the purposes of science, commerce, or ornament, but has included the results of experimentation on the capacity of fusion with the various metallic substances newly added to the list of elementary forms of matter, with results of curious interest to the laboratory student. From Mr. Crookes, the discoverer of thallium, he has received a specimen of an alloy of equal parts of that metal and silver, fairly malleable, but not equal to much hammering, easily cut with a penknife, white on the surface when freshly scraped, but quickly tarnishing and turning a yellow tint, owing to the oxidation of the thallium. When moistened turmeric paper is applied even to its freshly-cut surface, the paper is immediately stained brown. Such an alloy is hardly likely to be of much practical use. The two metals, though readily fusible together, being easily separated on a cupel, Mr. Crookes suggests that thallium might be used instead of lead for the cupellation of silver. An alloy of 40 per cent. of palladium with 60 per cent. of silver has been introduced with effect into the arts. It is white, pretty hard, elastic, and malleable. It is not blackened by sulphuretted hydrogen, even when, as Dr. Percy found, the palladium is reduced to 25 per cent. He had made of it thirty years ago a set of weights which remain as bright as at first. Rolled into sheet and reduced to powder, it has been found to adhere well to china by firing, and to acquire a fine polish by burnishing, but its colour is inferior to that of silver. This alloy has been used by dentists. No alloy of silver and iridium has yet been found possible. A mixture of these metals having been exposed to a high temperature, on attempting to pour out the contents of the crucible, silver alone flows out, a thick mass being left in the crucible. Berthier tried in vain to alloy silver and chromium; nor has any one else, as far as Dr. Percy knows, been more successful. The same French savant came nearer to success with tungsten and silver. Dr. Percy in 1844 tried the alloy of 100 grains of tungsten, prepared from tungstate of ammonia, with 300 grains of fine silver and some charcoal. A button of metal was obtained which weighed 398 grains. This was melted again, but failed to be cast in an ingot mould, as it could not be fully poured out. It was white and tough as standard silver, but was no more than a mechanical mixture, such as that produced by heating copper and tungsten together. From an experiment made with small quantities Berthier concluded that molybdenum behaves towards silver like tungsten. Whether potassium will alloy with silver seems doubtful; but an alloy of 30·32 per cent. of silver, and 63·68 of sodium has been produced by Mr. Louis in Dr. Percy's laboratory. Alloys of aluminium in various proportions with silver have been applied to industrial and artistic purposes, not being affected by sulphuretted hydrogen, and proving, when mixed in equal parts, as hard as bronze. An alloy of 100 parts of aluminium and five of silver has been used for watch-springs. Our author has met with no satisfactory record of alloys of silver with glucinium, barium, strontium, calcium, titanium, rhodium, osmium, vanadium, or tantalum. Alloys of silver and gold will be considered in the forthcoming volume.

It is impossible to predict when we shall have exhausted the ores of silver, or the natural sources from which the metal may be extracted. Nor is it easier for mineralogists to arrive at a perfect agreement as to the analysis of the metal, whether in its native state or in its various associations. After going systematically through the previously known mineral species, the regions in which they are found, and their constitution as determined by analysts of the highest repute, our author has to supplement his statement with a list of argentiferous minerals brought to notice since that part of his work was set up in type. Amongst these are the polyarsenide of copper, silver and bismuth, from Copiapo, the mercurial selenitic sulphide of silver from Caracoles, and the fahlerz or grey copper ore, very rich in silver, from Huanchaca in Bolivia, with their analyses and description by Domeyko. Besides those ores which constitute mineral species, containing silver either as an essential or as an isomorphous element, there are also many other ores which contain a compound of silver as an accidental constituent mechanically intermixed. Native gold is always argentiferous. Both silver and gold have been found in native arsenic from Bolivia. From galena, which is always argentiferous, a large quantity of silver is annually extracted in the United Kingdom and in other parts of the world. Blende, and sulphuretted ores of copper, as well as sulphuretted and arsenical ores of iron, are occasionally argentiferous, as Dr. Percy has shown whilst describing the processes of lead-smelting in his volume on the metallurgy of that metal. In his volume on iron and steel it was recorded that silver to the extent of half an ounce per ton had been found in a black-based iron-stone from South Wales. The presence of one centigramme of silver in a cubic metre of sea-water has been reported by Malaguti and Durocher, who thereupon compute the total yield of silver from the ocean at some 2,000,000 tons, or two thousand times the annual product of all the known terrestrial sources.

In dealing with silver assaying the author does not attempt a history of that art, interesting as such a record would be. He seeks to describe, as concisely as is compatible with clearness, the art as practised in the metallurgical laboratory of the Royal School of Mines. The reader can here form a clear idea of the soundness and practical utility of the teaching there imparted. The first part treats of the assay of argentiferous ores and metallurgical processes; the second of the assay of gold and silver bullion, coin and plate. Some valuable hints from practical refiners are appended "on the states in which silver is imported into England, and the necessity of precautions in purchasing it." An important section is taken up with the separation of silver from metallic copper by the liquation process, which is followed by silver smelting as applied both to ore containing silver in the simple metallic state and in combination with lead. The subject of amalgamation, with extraction of silver from its ores by means of mercury, as practised both in ancient and more recent times, is exhaustively treated, and this completes the volume, the value of which is enhanced by an excellent index. We regret our inability in a notice so limited to do justice to the stores of knowledge and the capacity for imparting instruction which entitle the work to a very high rank in the literature of practical science.

JEZEBEL'S DAUGHTER.*

As a Dedication to the first volume of this novel Mr. Wilkie Collins publishes an address "To Alberto Caccia," in much the same way as Lord Beaconsfield the other day wrote his letter to the Duke of Marlborough. Signor Caccia, as we learn, is Mr. Collins's "good friend and brother in the art," and the translator of his novels into Italian. It is as absurd to suppose that this gentleman did not know already what he was told in the Dedication as that the Lord Lieutenant of Ireland did not beforehand know what the Prime Minister told him with so much gravity and in such peculiar English. Great men of all kinds do not easily bring themselves to address the people directly. They always like to have a confidant, to whom they speak with the utmost frankness like the hero on the stage. They never betray by even a single glance that they are conscious of the presence of a vast audience that is hanging on all they speak. Their sole aim is to make their good and trusty friend understand their motives and their actions, and so long as he is in a position to judge them

* *Jezebel's Daughter.* By Wilkie Collins. 3 vols. London: Chatto & Windus. 1880.

justly, they are indifferent to the opinion of the rest of the world. So Mr. Collins begins by informing Signor Alberto Caccia—and informing him in print—"that this new novel does not present the proposed sequel to my last work of fiction—*The Fallen Leaves.*" This important fact, it will at first sight seem, might very properly have been left to the translator to discover for himself, as soon as he set about his task of turning the book into Italian. But in the next paragraph we see that he is treated just as if he were an English duke living in Ireland. He is written to, but he is not, if we may so say, written at. Mr. Collins thus continues his Dedication:—

> The first part of that story has, through circumstances connected with the various forms of publications adopted thus far, addressed itself to a comparatively limited class of readers in England. When the book is finally reprinted in its cheapest form—then, and then only, it will appeal to the great audience of the English people. I am waiting for that time, to complete my design by writing the second part of "The Fallen Leaves."

Mr. Collins is not quite so ambitious as Tom Brown, Dr. Johnson's first master, who published a spelling-book and dedicated it to the Universe. He is satisfied with the great audience of the English people. We once knew an eccentric but somewhat humorous gentleman who, whenever he saw a crowd gathered together, would mount the nearest steps, and gravely bow to it with a mingled air of condescension and importance. This he did so well that once or twice he was almost mistaken for a great man, and only just missed being greeted with cheers, instead of hisses and laughter. Mr. Collins, it will be noticed, does not merely address this great audience of the English people. He appeals to it. He has, it would seem, been brought before the judgment-seat of certain critics who flatter the prejudices of a narrow-minded minority of readers. These writers, "the nasty posterity of Tartuffe," as he calls them, had, it also appears, attacked other stories of his, as *Basil*, *Armadale*, and *The New Magdalen*. Happily he himself knows "that the wholesome audience of the nation at large has done liberal justice to those books." Meanwhile *Fallen Leaves* is still sold at too dear a price for liberal justice to be done to it. It is painful, no doubt, for the author patiently to wait under the shameful charges that have been made against him. He longs to appeal in the case of *Fallen Leaves* also to the wholesome audience of the nation, the great audience of the English people. But "circumstances connected with the various forms of publication" are too strong for him. He longs for justice; but, after all, the novels of a deeply-injured man must first be sold in three volumes at half-a-guinea the volume. He should remember, however, that this great wholesome audience is perhaps waiting very eagerly for the promised continuation. In this expectation we do not ourselves share. We certainly did read *Fallen Leaves* when it came out; and, if we can trust our memory, we laughed at it, as we have laughed at more than one of Mr. Collins's stories. What it was all about we have altogether forgotten. That he had promised to continue it we had also forgotten. When he does bring out the second part we shall be anything but pleased; for we shall not, we fear, be able to understand it, through our entire forgetfulness of all that had been told in the three previous volumes. And yet it is by no means a book that we ought to have forgotten. If we may trust the author's account, it is really a pious work. "I say plainly," he writes, "that I have never asserted a truer claim to the best and noblest sympathies of Christian readers than in presenting to them, in my last novel, the character of the innocent victim of infamy, rescued and purified from the contamination of the streets." This may be very true. At all events we are not prepared to deny it, for we bear Mr. Collins's writings far too little in our memory to be able to form an estimate of the comparative claims of each of his novels to Christian sympathy. The only fact that we do clearly remember about *Fallen Leaves* is its dulness and its silliness. But very good people, very good Christians moreover, may be very dull and also very silly; and so we shall not on that account dispute the author's assertion or deny his claims.

While, however, we had forgotten, as we have said, his promise to write a sequel to his good book, and while, therefore, we are indifferent to his failure to keep it, it can scarcely be hoped that the great wholesome audience will be equally patient under this cruel disappointment. Even though *Fallen Leaves* is not yet in a cheap enough form to bring it within the reach of all, yet at all events it is known to those who can subscribe to a circulating library. The best and noblest Christian sympathies of these readers have been aroused, and their interest too. The hero and heroine were doubtless left in the midst of great perplexities and dangers. Everything was done, we may be sure, to contrive a mystery and to stimulate curiosity—a pious curiosity, we will add. At least half a year has passed, and surely the volumes of a novel can be written at the rate of one in every two months. The dreary winter is over, spring has at length come, and *Fallen Leaves*, it might have been hoped, was going to be supplemented by "Fresh Leaves," or "Verdant Shoots," or "Spring Buds." Instead of that appears *Jezebel's Daughter*. Let the English people be patient. Happily they have the sudden dissolution and the election to console them; while, after all, *Jezebel's Daughter* is really by no means bad when looked upon as a mere sop to stay the stomach. Let us see what Mr. Collins thinks of it himself. He tells his translator that he will find, he hopes, in its pages two interesting studies of humanity. And there is more than this. But here Mr. Collins must speak for himself:

> In view of the distrust which certain readers feel, when a novelist builds his fiction on a foundation of fact, it may not be amiss to mention (before I close these lines), that the accessories of the scenes in the Deadhouse of Frankfort have been studied on the spot. The published rules and ground-plans of the curious mortuary establishment have also been laid on my desk, as aids to memory while I was writing the closing passages of the story.

Mr. Collins's audience is the great audience of the English people, the wholesome audience of the nation, who will like their story-teller all the better when they know that he has kept by him, as he wrote, the rules and ground-plans of a mortuary establishment. They will at once give up Shakspeare. What rules and ground-plans had he of the churchyards at Elsinore and Verona? We trust that our lady-novelists, who are much given in their stories to death-beds and scenes in churchyards, will take a hint from this ingenious, if somewhat unimaginative, novelist. Let them be able to assure their readers that the chapter in which they kill off their heroine has been written under the directions of an eminent general practitioner, while all the arrangements of her funeral have been revised by an experienced undertaker from Messrs. Banting. It would not be amiss to give in an appendix the rules and ground-plans of one of the suburban cemeteries, with the different scales of funeral charges.

Mr. Collins's Dedication has taken up so much of our attention that we have left ourselves but scanty space for dealing with his story. Its name is somewhat misleading, for the real heroine is Jezebel herself, and not her daughter. In her the author, as he tells us, or as rather he tells Signor Caccia, and through him the great wholesome audience, "has endeavoured to work out the interesting moral problem, which takes for its groundwork the strongest of all instincts in a woman, the instinct of maternal love, and traces to its solution the restraining and purifying influence of this one virtue over an otherwise cruel, false, and degraded nature." The tale is told to a considerable extent in the convenient forms of diaries and other documents. Even the wicked heroine, who is accidentally killed by poisoning just after she had tried to poison a highly respectable and most virtuous hero's elderly aunt, had kept up to the last a record of her crimes. When she had herself taken the poison, and felt it working, she had intended "to destroy these compromising pages of her diary," but her mind had begun to wander, and she failed in the attempt. Her death is not described with that minuteness of horrors in which Mr. Collins so often delights. "I cannot prevail upon myself to dwell," he makes the narrator of the story say, "on the deliberate progress of the hellish Borgia poison, in undermining the forces of life. The nervous shudderings reached their climax, and then declined as gradually as they had arisen." Perhaps the author's moderation is due to his fear that he might not be able to give a description which would be at all worthy of the scene in the deadhouse, which had just been brought to a close. It may, however, be owing to nothing more than the happy fact that he had got so near the end of the third volume that he had only just space to wind up his story. He had still Jezebel's daughter on hand and her lover, and he had to get not only Jezebel killed but the young people happily married. Whatever may be the cause, we are only too glad to have such singular moderation displayed. We feel, however, that the great wholesome audience who read this book when in its cheapest form will not share in our satisfaction. Such a moral writer as Mr. Collins surely could, they will maintain, in describing the death-bed of a poisoner, a second time appeal to "the best and noblest sympathies of Christian readers." As it is, even the very brief account that he does give of the end of this miserable woman, he closes with the pious ejaculation, in a paragraph all to itself, "Lord, have mercy on her—miserable sinner!" But this utterance would have been far more effective had "the deliberate progress" of the poison been traced with Mr. Collins's skill, and at his usual length.

We shall look forward with some slight interest to the publication of Mr. Collins's next story, whether it is to be the continuation of *Fallen Leaves* or not. We are not too old to learn as critics, and we shall hope that he will next time deal, not with those who have offended him by failing to see how moral a writer he really is, but with those who blame him for his extravagance and his dulness, and who laugh at him for his overweening conceit.

LEWIS AND SHORT'S LATIN DICTIONARY.*

IT might puzzle the deftest of literary conjurors to devise an all-sufficient test of a new dictionary or lexicon. It is in the nature of things that each one of such works should lay claim to some happy addition or innovation which no pains have been spared to make the most of. From the very beginning of Latin lexicography in England, Thomas Cooper of Magdalen College School professes, in his *Thesaurus* of 1584, to have so improved on Stephens, Eliot, and his former self, "ut nihil pene desyderari possit," and the whole history of the matter is, in fact, a continued process of development. The result is that a brushing up of the literature of the subject is more curious than profitable—one fact coming out palpably, that lexicographists have a tendency to borrow wholesale, so that occasionally there occurs, even down to modern days, a "damnable iteration" of blunders and

* *A Latin Dictionary, founded on Andrews's Edition of Freund's Latin Dictionary.* Revised, Enlarged, and in great part Rewritten, by Charlton T. Lewis, Ph.D., and Charles Short, LL.D., Professor of Latin in Columbia College, New York. Oxford: Clarendon Press, &c. London: Macmillan & Co. 1879.

misquotations. It must, however, be admitted that the writers of prefaces to the dictionaries of the last sixty years, whilst commemorating with abundant flourishes their own improvements, are mostly candid enough to acknowledge the researches of their rivals. Amongst the Latin dictionaries (for reference) most familiar to the scholar will generally be found the so-called Dictionary of Forcellini (and Facciolati, by Bailey), Scheller's Lexicon, and, going further back, Gesner's Thesaurus, all of which were needed in our college days to supplement the imperfect and defective services of our Ainsworth. A better time dawned when Dr. Wilhelm Freund's *Latin-German Dictionary* of 1834-45 was translated at New York under the editorship of Dr. Andrews in 1851, and became very shortly the most extensively used Latin Dictionary in England and America. The present editors of Andrews's Freund do not hesitate to assert that its only rivals are really "reprints or abridgments, so that it has formed in fact the standard book of reference for a generation of scholars." To some extent, no doubt, this is true, though any one who is inclined to glance at the preface of Dr. W. Smith's *Latin-English Dictionary* (1855) may find under five different heads, in pp. vi.-vii., sufficient proof of inaccuracy to show that it could not have been an unerring guide to competing successors; indeed our own experience of the copious and critical Latin-English Lexicon of J. E. Riddle (1849) and of Dr. W. Smith (1855), the former based on Freund immediately, the latter much more on Forcellini and Freund than on Andrews, has hitherto disposed us to hold fast by the two tolerably compendious works just named, instead of having recourse to Transatlantic lexicographers. But the advances made in the ancillary sciences of lexicography—*e.g.* orthography, philology, syntax, history, archæology—have required that the Freund or Andrews of to-day should furnish the student with far more than the scholarship of thirty years ago could supply; and therefore, after a partial revision by the original author (fifteen years ago), and a recourse to Professor Henry Drisler, who counselled, but declined to undertake, a thorough reconstruction of the work, the sheets were handed over, with all appropriate aids, to the present editors, for compilation of the Dictionary before us. Of these, Dr. Short is responsible for letter A (or 216 pages), Dr. Charlton T. Lewis for the remainder, or lion's share—namely, 1,793 pages. Help has also been derived from other eminent coadjutors; such as Dr. Gustavus Fisher, of New Brunswick, and Professor G. M. Lane, of Harvard, the former of whom has communicated excellent articles on the etymologies of such words as "contra," "sic," "suus," "sisto," "solvo," "tunc," "tum"; the latter a vigilant and fruitful correction of the press.

Two very useful prefatory catalogues or indices—the one orthographical, the other of ancient authors or books referred to in editing the work—are good features in this edition. The former is mainly taken from Brambach's *Aids to Latin Orthography*; the latter contains the names of most of the books of reference we should have expected, though we might stickle for a citation of that handy ancient gazetteer, the *Orbis Latinus* (of Graesse, Dresden, 1861), and perhaps of Hübner's *Roman Inscriptions*. The abbreviations used of ancient authors, their works and dates given on the authority of Teuffel, leave little to be supplemented or corrected. The date of Palladius is rightly given with a query, and the authorship of *Ætna* is assigned, in apparent following of Mr. Munro, to Lucilius Junior. In *Notes and Queries*, November 8, 1879, Professor Mayor of Cambridge has generously testified to the distinct advance of this new lexicon on its rivals and predecessors for common use, its obligations to the excellent *Lateinisch Deutsches Wörterbuch* of Georges, its removal of many errors, and its discrimination of various senses, such as the two under "abortus" and "conditio," "conditio," "condicio." But, as was to be expected, he has noted not a few incorrect references which Dr. Lewis has transplanted from Freund, as where, under "camisia," he refers to "Hieron. de vest. mul. 64. n. 11."; here, as Forcellini rightly has it, the reference should be to Hieron. de Vest. Sac. Ep. ad Fab. 128, sect. 11. A similar reference for "Ininterpretabilis sermo" is impossibly referred to Vulg. Hebr.; v. 71? and under "lanceo" Mr. Lewis and Dr. Short betray an oblivion of the treatise of Tertullian when they refer to Tert. adv. Marc. 13, where a little more exactness would have taught them that the correct reference would have been, with Scheller, Tert. c. Marc. c. iii. l. 8. To such persistent lifelong students as Professor Mayor and a few others the examination of a new Lexicon must be a "happy hunting-ground," and we cannot too heartily re-echo his advice to English students to show their gratitude to the New-World scholars and their Dictionary by laying it on their library table for marginal correction and revision.

The task of reviewing a dictionary must needs be elephantine, if it is to proceed on the principle of testing the work page by page, or even by the process of examining some specified classes of words—dramatic, botanic, zoologic, archaic words, words of the silver age, and so forth. It is indeed a task scarcely to be accomplished with any thoroughness unless with an ample margin of time, and an amount of leisure scarcely compatible with any but the most orderly and methodical student life. In default of this, one must be contented to pursue a kind of "hide-and-seek" process, suggested by one's classical reading from day to day, with the aid of memory and the helps to it afforded by marginal or special notes, the result of which may be to amass a tolerable number of test words, whereby to measure the sufficiency of the lexicographers' labours in different fields. A word or two may be said, in passing, in reference to the sound philological help of Dr. Fisher, which the indication of the preface enables us to examine in a limited number of examples. Thus of *Contra* we are taught that the stem is *con*, *i.q. cum*, through a comparative form *conter*; cf. alter, uter, inter, præter, &c., in the *abl. fem.* form, like the locative ablatives *ea*, *quâ*, &c., cf. ultrâ, intrâ, extrâ, citrâ; after which the various senses of the adverb and preposition are carefully discriminated and graduated. *Sic* is traced, through old form sice, Plaut. *Rud.* ii. 4, 12, and *seic*, (C. I. L. 818) to *si*, the locative form of pronoun stem *sa* = ὁ, ἁ, or ἡ, and the demonstrative *ce* (see Corss. *Ausspr.* i. 777); and the demonstrative adverb of time, "Tunc," is derived from *tum* and the demonstrative suffix *ce*, whilst various instances are adduced to illustrate the use of *tunc*, always emphatically and generally of *point* of time, in ante-classic and classic prose. In post-Augustan writers it is often used without emphasis and of *periods* of time. The statistics of the comparative use of *tunc* and *tum* give the former as infrequent until after the Augustan period. Cicero has thirty *tums* and Cæsar five, for one *tunc*; but *Tunc* predominates in the post-Augustan writers and jurists. Thus far we have noted one or two samples of Dr. Fisher's etymologies. A few more may be taken from Mr. Lewis's field. Thus *exsul* is derived, not, as usually, from "solum," but from *sal*, Sanscrit *sar*, "to go." Latin, salire, saltare, cf. præsul, consul, subsul (Corss. *Ausspr.* 2. 71). Feriæ is given as *i.q. fesiæ* from the same root as "festus"; *garrio* is traced to the Sanscrit gir, γῆρυς, voice; and *grex* to the Sanscrit *jar*, "come together," compare ἀγείρω and armentum. *Herba* is given as the old Latin "forb-ea," Greek φορβή, Sanscrit *bhar*, to nourish. *Infula* is traced to the Sanscrit *bhâla*, brow, cf. the Greek φάλος φαλαρά; and the root of *latro* is found in λα, λαϝ, in λάω and λεία, lucrum. The shades of sense of this word, from a hired servant or mercenary to a freebooter, are curious, though familiar to Latin readers. *Lupus*, akin to λύκος, the basis of a score of adages, is connected with the Sanscrit *vrika*, and our *wolf*. To glance at a question of spelling, we note that our Transatlantic editors solve the question of cheragra *v.* chiragra by giving the former as the poetic collateral form. For this they have the sanction of Bentley and Orelli on Hor. *S.* ii. 7, 15, which Conington also approves on the passage from Persius, v. 58:—Cum lapidosa cheragra Fregerit articulos—a metaphor suggestive of a hailstorm of chalkstones, or of the man referred to in Mr. Pattison's *Casaubon* who had discharged from his body "more than his whole weight in chalkstones." If we want a sample of an old official word of Rome, we can take one that occurs frequently in Livy (Book I. c. 8); its origin is referred to the Etrurians and its etymology to *ligo*. It seems to have been pronounced Lictor. Under this article we are told that in processions the *primus lictor* went foremost, and the nearest to the Consul was called *proximus*. They were freeborn till the time of Tacitus, formed "decuriæ," or companies, "apparitorum," and attended only such magistrates as enjoyed "potestatem cum imperio." Why a lady's large pearl worn in private was designated her "Lictor" in a figure is not so clearly explained by Smith or Lewis and Short as by Forcellini, who says that it was usual at Rome, "propter unionem" (*h.e.* the ornament in question), "decedi feminis, assurgi, et reverentiam conciliari."

Under the word Macula (derived by our editors from Malocula, maleula, cf. Sanscrit *Mala*, "dirt") we miss, amongst general or transferred senses, the one which Mr. A. Palmer of Dublin recognizes in his edition of Ovid's *Heroides*, v. 19, "retia maculis distincta"—to wit, "nets distinguished, or marked out, by knots," so called, no doubt, as he plausibly suggests, because they were of a different colour from the net itself. Among other interesting questions on which light is found in passing, is the intensive force of *dis* in "Distædet" (I greatly loathe), "dispudet" (I am much ashamed), in Terence and Plautus; where, *sub art.* "dis," it is shown that this intensive force is but a development of its original meaning, as *e.g.* "differtus" is properly "stuffed out," and "dilaudo" is to "scatter praise of." The space devoted to the explanation of "Epimenia," "provisions for a month," "a month's rations," Juv. vii. 120, is needlessly scanty, and requires to be supplemented by Professor Mayor's note, who refers the word to Moorish slaves, and says that to such were served, besides corn, wine, and olives, windfalls and tough bulbs. The same erudite searcher might have brought stores of Roman lore to bear on that lounge of gossips, the "Tonstrina." We must say that we cannot excuse the omission of the word "eschatocollion," on the score of its being a Greek form, for "the last folded sheet," or "the last page," when it occurs in so well-known a poet as Martial ii. 6, and when it might have been compared with our kindred word "protocol." Whilst we are upon the subject of Martial, it may be interesting to inquire what light is thrown by the editors upon the Roman substitute for glass. Our resort is to the word "specularis," and the so-called "lapis specularis" with which Roman windows were furnished. After the general sense of the adjective "of or belonging to a mirror," we find "in particular specularis lapis," "a kind of transparent stone, muscovy-glass, isinglass-stone, mica." Hence "specularia-orum, n." window-panes, a window. *Loci classici* for this word and its use are duly cited here—to wit, Juv. iv. 21, and Mart. viii. 14:—

Hibernis objecta notis specularia puros
Admittunt soles, et sine fæce diem.

and it is beyond doubt that some transparent material was in use by Romans for greenhouses and litters. It is curious, however, that Drs. Lewis and Short ignore "talc" as a synonym of the "specularis lapis," and split "talc" as the

material of Roman "specularia." "Talc," we know, "is a soft magnesian mineral of a soapy feel, and usually of a greenish, greyish, or whitish colour, occurring in foliated or easily cleavable masses, and also in compact granular masses." More is to be learnt from Dr. Daubeney's *Lectures on Rom. Husb.*, p. 294-5, and from Becker's *Gallus*, 363. Indeed the former of these books would be a mine of information, out of the materials of which we might test the new lexicographers as to the terms of Roman agriculture, farming, live-stock, poultry, and *res rusticæ* in general. Thus the "flos in pratis cui nomen *amello*," Virg. Georg. iv. 27, is identified with the "Purple Italian Starwort" or "Aster Amellus" of Linnæus. The "Volæma pira" of Georg. ii. 88, which some have dubbed "warden" and some "pounder pears," appear in this dictionary by the former distinctive appellation, though, had the derivation been vouchsafed, "quia volâ manus impleant," it might have shown cause for the latter identification. A somewhat frequent recurrence, in the course of our testing the work before us, to the "Ætna incerti auctoris" so ably edited by Mr. Munro in 1867, has satisfied us that Drs. Lewis and Short's acquaintance with that poem is very scanty. In a single passage of it (*Ætn.* 292, &c.) occur two distinct metaphors relating to hydraulic machines, so uncommon that it is a locus classicus on the topic, the one referring to such an instrument as Claudius's *Triton*, on Lake Fucinus, which signalled the naumachia, the other to the *cortina*, *i.q.* an hydraulis or water-organ, so called perhaps from its tripodlike shape, perhaps from the noise resembling that emitted from the Delphic *cortina*. The lines most to the point run thus:—

> Nam veluti sonat hora duci *Tritone canoro*,
> Pellit opus *collectus aquæ* victusque moveri
> Spiritus et longas emugit buccina voces:
> Carmineque irriguo magnis *cortina* theatris
> Imparibus numerosa modis canit arte regentis
> Quæ tenuem impellens animam *subremigat* unda;
> Haud aliter summota furens torrentibus aura
> Pugnat in angusto, et magnum commurmurat Ætna.

Here in the first line the epithet "canorus" exalts the Triton above the level of an ordinary, mute, fishpond-God, such as is cited under Triton B. Transf. I., and no reference is made to the musical Sea-god worked by water-pressure ("collectu aquæ," for which Lewis and Short cite Lucret. iv. 414). Just below, where "carmine irriguo" seems to indicate the same mechanism, the editors, had they examined the passage, might have divined that "cortina" meant not the "circle of a theatre," as they give it, but a water-organ such as is described by the Greek writer on pneumatics, Heron, and in relation to the organism of which the expressive word "subremigat" manifestly plays an important part. The editors might with advantage glance at the poem we refer to for one or two valuable corrections of their pages. Thus, *inter alia*, they might cite Ætna (325), for "sipho" = "a fire engine"; and 267 for "fœnilia," in the sense of hay-lofts.

A word deserves to be said, in conclusion, for the completeness of the proper names of this Dictionary, both in matter and quantity. Whether it is a parasite from a comedy of Plautus, or a geographical division of ancient Gaul, a goddess, a nymph, or a myth, that we are in quest of, either and all will be found within the covers of the present work. This was not always so with lexicographers, though it is evident that when one is looking out words, two books of reference in hand are less desirable than one. It is to be hoped that this feature may be retained in the dictionaries of the future, whether Professor Key's, said to be already under revision at Cambridge, or the one which it is currently asserted that we may expect from Oxford.

CHERBULIEZ'S *AMOURS FRAGILES*.*

It is perhaps needless to tell any one who is at all acquainted with M. Cherbuliez's writings that, in spite of the title of his latest production, it has nothing in common with the school which chooses to call itself realistic, and which has been admirably satirized by M. Jules Claretie in *Le Troisième Dessous*. Never perhaps was any word so grossly misapplied, even by the English votaries of the widely opposite "æsthetic" school, as *réalisme* to the works of M. Zola and the writers who attempt to outdo him in the minute description of non-existent garbage. Assuming even that M. Zola's descriptions are true, which, in the case of his latest outrageous and unamusing production, they certainly are not, what is there more real in a gutter or a scavenger's cart than in a fine landscape? What claim to showing things as they are has a man who collects a quantity of traits of infamy and calls the miserable hotch-potch a character? In such a proceeding there is neither art nor imagination; it requires nothing but the patience of a mudlark. However, it may be supposed that M. Zola will be forgotten, or remembered only as a literary monstrosity, when M. Cherbuliez's writings still continue to give delight.

M. Cherbuliez's latest volume contains three stories, "Le Roi Apépi," "Le Bel Edwards," and "Les Inconséquences de M. Drommel." The first of these is specially remarkable as an instance of how much can be done by a master of the art of fiction with what seem scanty materials; and it contains some characters which are hit off in M. Cherbuliez's best manner. The story opens by telling us that one night, coming home from his club, the Marquess de Miraval found awaiting him a letter from his niece, Mme. de Penneville, who was staying at Vichy. She writes to say that the waters have done her a great deal of good, but that her recovery is, she thinks, endangered by some bad news. The doctors all say that "le premier devoir des personnes qui souffrent d'une hépatite chronique est de ne point se faire de soucis; je ne m'en fais pas, mais on m'en donne." Her mind is troubled and tormented with thinking of a certain Mme. Corneuil, whom she detests without ever having seen her. "You, my dear uncle," she writes, "have always been curious and well-informed; let me know as soon as you can who and what is Mme. Corneuil." The Marquess was an old diplomatist, sixty-five years of age, with every reason for enjoying the world after his own fashion, part of which was to look on at life like one who is out of the game but knows its every move. He had had two years of married life, and had then resolved to remain a widower, replying, as did a celebrated painter, to those who advised him to marry again, "Est-il donc si agréable, en rentrant chez soi, d'y trouver une étrangère?" He had never regarded women from a serious point of view. He was a sage, or some might say an egotist; "c'est une distinction qui n'est pas toujours facile à faire." M. de Miraval writes back to his niece a long letter concerning Mme. Corneuil. She was the daughter of an *agent d'affaires*. M. Corneuil had met her at Alexandria, had married her, and come back with her to his native town, Périgueux; four years after which a separation between them was pronounced, giving half of the husband's fortune to the wife. Mme. Corneuil, armed with this, came to Paris. She was ambitious, she desired to have a *salon*. She gave little dinners, she attempted literature; and, when that failed, she devoted herself to good works. The Marquess adds that he knows why his niece is troubled. Her son Horace, who is of an abnormally studious disposition, is mad on the subject of Egyptology, and has fallen in, in Egypt, where he has been pursuing his studies, with Mme. Corneuil. This, M. de Miraval thinks, she ought to regard rather as a blessing than as a trouble, and he gives his reasons for saying so. Mme. de Penneville writes back to him begging him to come to her at Vichy; and, in spite of that love which every well-organized person has for Paris, he goes. She meets him at the station with the exclamation, "Figurez-vous que cette femme est veuve et qu'il s'est mis en tête de l'épouser!" The Marquess replies, "Ah! pauvre mère! Cette fois, j'en conviens, le cas est grave." In the conversation which follows between them, it appears that Mme. Corneuil and her mother are staying at Lausanne, and that Horace, who has written a letter of twelve pages to his mother concerning his intended wife, is also staying there. "My dear uncle," says Mme. Penneville, "if you would only go to Lausanne." The Marquess gives a start of surprise. "Seigneur Dieu! dit-il, Lausanne est bien loin."

However, with an amount of heroism and self-sacrifice equal to that displayed under similar circumstances by Major Pendennis, M. de Miraval does start for Lausanne, leaving strict injunctions with Mme. de Penneville to believe not a word of the letters which he will write to her, but to answer as if she believed them, and to send his letters on to Horace with instructions to keep them private. His first action on arriving at Lausanne is to procure a complete set of fishing tackle, his second to dine, and his third to pay a visit to Horace. Horace himself is employed, pen in hand, upon his great work *Histoire des Hycsos*. He has made it his great object to prove that the king under whom Joseph was minister was Apophis or Apépi, King of the Hycsos, and the reading at the Institute of the first chapters of his history has made some noise. We have a significant description of his appearance and that of his room:—

> Vêtu d'une sorte de burnous en laine blanche, le cou libre, les cheveux en désordre, il était accoudé sur une table ronde, en face d'une écritoire dont le couvercle était surmonté d'un sphinx, et sa figure exprimait le contentement du cœur uni à la parfaite sérénité de la conscience. Au milieu de la table s'épanouissait une belle rose pourpre, presque noire, qu'il avait mise tremper dans un verre et dans laquelle une statuette en faïence bleue, qui représentait une déesse égyptienne au visage de chatte, plongeait indiscrètement, sans se dérider, son museau rébarbatif. Horace contemplait par instants ce museau, qui lui était cher, et cette rose, que Mme. Corneuil avait cueillie pour lui il n'y avait pas une heure; par instants aussi, tournant ses yeux vers sa fenêtre toute grande ouverte, il s'apercevait que la lune, alors dans son plein, projetait dans les eaux frissonnantes du lac une longue traînée de paillettes d'or. Mais, par une grâce d'état, il ne laissait pas d'être tout entier à son travail, il n'avait aucune distraction, il appartenait aux Hycsos. La lune, la rose, Mme. Corneuil, la déesse à la tête de chatte, le sphinx qui surmontait l'écritoire, les *Impurs* et le roi Apépi, tout cela se mariait, se confondait intimement dans sa pensée. Les bienheureux du paradis voient tout en Dieu et peuvent penser à tout sans se distraire un seul moment de leur idée, qui est éternelle. Le comte Horace était tout à la fois à Lausanne, dans le voisinage d'une femme dont l'image ne le quittait pas, et en Égypte, deux mille ans avant Jésus-Christ, et son bonheur était parfait comme son application.
>
> Il venait d'écrire cette phrase: "Considérez les sculptures de l'époque des Pasteurs, examinez avec soin et sans parti pris ces figures anguleuses, aux pommettes très saillantes, et, si vous êtes de bonne foi, vous conviendrez que la race des Hycsos n'était pas purement sémitique, mais qu'elle était fortement mélangée d'éléments touraniens."
>
> Satisfait de sa conclusion, il interrompit une seconde son travail, posa la plume, et, attirant à lui la rose pourpre, il la pressa sur ses lèvres; mais il entendit frapper à sa porte. Il remit précipitamment la rose dans son verre, et d'un ton d'humeur il cria: Entrez!

M. de Miraval comes in, and then ensues between the two a dialogue conceived and written with all M. Cherbuliez's keenness and grace. In the course of it the uncle says, "Et moi, je te jure par ce qu'il y a de plus sacré, par le grand Sésostris lui-même"; and Horace interrupts him with "Oh,

* *Amours Fragiles*. Par Victor Cherbuliez. Paris: Hachette et Cie. 1880.

my dear uncle, how mistaken you are! Of course it is natural enough, since you have never studied the history of Egypt closely; but let me tell you that, if ever in the world there was an exaggerated and undeserved reputation, it is that of the man whom you call the great Sesostris, and whose proper name was Rameses the Second. Swear, if you like, by King Cheops, vanquisher of the Bedouins; by Menès, the builder of Memphis"; and so the young man runs on for about a page and a half, winding up by saying of Sesostris, "son seul titre de gloire est d'avoir eu cent soixante-dix enfants dont soixante-neuf fils." "Diable!" says the uncle, "c'est bien quelque chose que cela. . . Mais enfin qu'en veux-tu conclure?" "J'en conclus, répondit Horace, à qui l'incident avait fait perdre de vue le principal, j'en conclus que Sésostris. . . non, reprit-il, j'en conclus que j'adore Mme. Corneuil et qu'avant trois mois elle sera ma femme." To which M. de Miraval makes the unexpected reply, "Horace, mon héritier et mon petit-neveu, viens dans mes bras!" He explains that he is delighted with this youthful ardour, that he had imagined the affair was merely such a passing matter as, on an historical occasion, one of the Club des Hachichins called a "fantaisie de plafond"; but that, as he sees it is serious, he will, if Horace will introduce him, make Mme. Corneuil's acquaintance, and, if she is all that she is described, he will become his great-nephew's advocate with Mme. de Penneville. Then the wily old diplomatist begins his campaign. He is introduced to the lady, and, to use an expressive phrase, is "struck all of a heap." He becomes strangely capricious concerning the engagements which are made for their meeting again; he makes mysterious visits to the other side of the lake; he announces that he is going to leave Lausanne, and is found still staying there days afterwards. He writes a letter to Mme. de Penneville which, according to his instructions, she sends on to Horace, and which ends with, "Soit dit sans reproche, je regrette amèrement d'être venu à Lausanne; tu ne te doutes pas du triste service que tu m'as rendu en m'y envoyant, des journées orageuses et des nuits agitées qu'y passe ton vieil oncle qui t'embrasse." He had previously said that, despite Mme. de Corneuil's charms, he did not think her quite the wife for a student like Horace, and that he had always found fish and lovers very difficult people to deal with. In this comparison we may note in passing there is more meaning than at first sight appears. The Marquess continues by making half-confidences about a secret weight on his mind to Mme. Corneuil's mother; and the end of the whole thing is that one evening Mme. Corneuil falls fast asleep while Horace is reading out his most striking and convincing passage concerning "Le Roi Apépi." Letters of the most admirably characteristic kind are written by Horace, by Mme. Corneuil's mother, and to the mother by the Marquess, who has not read his *L'Aventurière* for nothing. The ending of the story, however, is, unlike that of the famous play, strictly comic, and we prefer not to reveal the secret of the Marquess's plan. We have left ourselves no space to speak of the other two stories in M. Cherbuliez's volume, but "Le Bel Edwards" is perhaps, after "Le Roi Apépi," a little disappointing. On the other hand, "Le Roi Apépi" might carry off two duller stories than M. Cherbuliez could write.

SKETCHES IN THE HUNTING FIELD.*

HUNTING sketches and scenes from the hunting field have been decidedly overdone, especially in the shape of correspondence to the sporting papers. We know nothing more dismally wearisome than the details of runs where the topography is given with a minuteness which would be valuable and meritorious if it applied to the geography of Central Africa. We do not doubt that these things have a strong personal interest for the riders whose going is lauded ecstatically, as for the fast ladies whose charms and horsemanship awaken the slumbering poetry in the soul of the labouring contributor. But these *Sketches in the Hunting Field* by Mr. Watson are of a very different character. They show spirit and freshness as well as knowledge; and the author, who speaks with authority as editor of *The Illustrated Sporting and Dramatic News*, writes like a gentleman as well as like a sportsman. He is greatly to be congratulated on finding a capable artist in Mr. Sturgess, whose studies are familiar to the readers of the *Graphic*. Turning lightly over the pages, Mr. Sturgess's lively illustrations give one a pleasant clue to the contents of the chapters. Thus in the frontispiece are a pair of horsemen jogging side by side, "Up the lane there, past the strawyard." The clever picture tells its own story. The broad-shouldered farmer in the low, broad-brimmed hat, and the easy-sitting coat with the square-cut pocket flaps, has clearly invited his elegantly attired companion, in the faultless cut-away and unimpeachable boots and breeches, to drop in at his homestead on his way back from the run. Both men are admirably mounted in their respective degrees; though the horse of the farmer may be described as serviceable, while that of his companion is stylish and fashionable as well. Then in the full-sized plates, and the telling little tail-pieces, we have a series of the incidents and humours of the hunting field and the steeplechase course. There are hunters full of suppressed fire being ridden gently along the roadside to the meet. There are horses at the meet and the coverside, playfully throwing off the accumulated exuberance of spirits which they have been bottling up through long confinement in the frost. There are horses out for gentle exercise, or being brought quietly up to the side of the mail phaeton, where the rider, luxuriating in the pleasure to come, is leisurely divesting himself of his wraps. There are horses craning at ugly fences, or clearing them lightly in their powerful stride, or crashing and blundering through rails and hurdles. The force of a few eloquently suggestive touches betrays the capabilities and inner mind of the rider; letting us into something of the secrets that exist between him and his horse. We can tell at a glance from his seat in the saddle, from his squared shoulders, his resolute wrists, and the iron grip of his immovable nether limbs, that he means jumping, and will not be denied. Or we surmise from a certain undefinable limpness, or from a spasmodic clutching at the horse's head, that caution instead of courage is his strong point, and that he is doing his best to ensure a refusal or a catastrophe. Here we have an animal newly saddled for a steeplechase, indulging freely in formidable antics that remind one of the performances of an Australian buck-jumper, and make the timid spectator's blood run cold, especially when the mud lies heavy along the course, and a searching wind from the north is penetrating to the bones.

If we turn from the illustrations to the text, our raised expectations are pleasantly satisfied. Mr. Watson is as handy with the pen as Mr. Sturgess is clever with the pencil. His sketches, on the whole, are eulogistical of divers sporting worthies, though a few of them are flavoured with good-humoured satire. Among the latter, of course, a foremost place is allotted to the sportsman who is strong in theory but defective in practice. Perhaps Mr. Tewters, the scientific sportsman, may be somewhat overdone, and overleaps the boundaries of legitimate caricature. At all events he is made to leap over little else, though he broaches his dogmas with serene self-confidence, even when he has come up to the scratch at the meet and in the saddle. It is his fixed opinion, authoritatively enunciated, that "a great deal too much nonsense is talked about men riding straight. Fencing is so simple that there is no reason why any man with common sense and the use of his limbs should not ride." We are assured that, to do Tewters justice, he has the courage of his convictions. By way of enforcing his position that "a seat is kept either by balance or grip, and a combination of the two methods affords absolute security," he goes straight enough at a fair hunting-fence. In practice he turns a violent somersault in the air, landing heavily on the other side on his back, while his horse goes galloping away from him. But any number of failures in the face of the field do not for a moment shake his profound convictions. He explains them with an ingenuity of apology which goes far to command respect; and he quotes sporting authorities and journals at second-hand, as if their doctrines were the fruit of his personal experiences. Decidedly more probable is the "after-dinner sportsman," "who goes wonderfully straight and well after dinner, or even at breakfast, especially after a glass of curaçoa or brandy, but who does not appear to equal advantage when hounds are running." "Fluffyer," like many famous after-dinner fishermen whom we have met with, firmly believes in his mythical feats; and, by dint of repeating his playful fancies, has come to take them himself for gospel. And many ladies might lay to heart with much advantage the moral conveyed in the chapter entitled "A Young Hunting Lady." Miss Kitty has pluck and considerable personal attractions, and, we may add, very considerable impudence; although the impudence may be ascribed almost as much to ignorance as to vanity. Born somewhere near the City, and brought up in Bloomsbury, she knew nothing of hunting, of horses, or of hounds, till her father, having made a handsome fortune, retired with it to a residence in the Meadowmere country. Pluming herself on her looks, and believing in her horsemanship, Kitty never imagines that she can possibly be in the way. She overrides the pack and heads the fox with a self-complacency that maddens earnest hunting-men and makes expostulation doubly difficult to the highly polished master of the hounds. And in honeyed accents, with wreathed smiles, she addresses herself to these hunting enthusiasts in the opening moments of a promising burst, praying them to dismount and adjust her girths, or to pull up and hold open a gate for her.

Among the sketches that set forth the more serious side of the subject "The Straight Rider" figures conspicuously; though Wynnerley of the Guards, on our first introduction to him, rather reminds us of a lady novelist's sensational military hero, whose outward appearance belies his qualities. Wynnerley "is a youth with mild blue eyes set in a smooth, rosy, and guileless countenance, decorated only by a faint and downy moustache, and now wearing such a weary and melancholy aspect that we who know him well understand that he is peculiarly happy and alert this morning." In reality, though a gentleman and a man of honour, the guardsman is hard as nails and sharp as a needle; and, as we need, scarcely add, a finished horseman. A picturesque and humorous incident in his public performances as a jockey is the manner of his winning the steeplechase at the Meadowmere Race Meeting. He has been brought down specially to ride old Fireworks, a veteran who must have come to the front in the betting had it not been for his diabolical temper, and his knack of unseating any average jockey. Wynnerley, when shown over the course, insinuates, with a pleasant hypocrisy that almost verges on sharp practice, his mortal apprehensions of the water-jump and of a stiff post and rails; the result being that his rather conceited guide, in his contempt for the nervous stranger, is encouraged to lay the more heavily against him. When Fire-

* *Sketches in the Hunting Field.* By Alfred E. T. Watson. With Illustrations by John Sturgess. London: Chapman & Hall. 1880.

works is ridden out on the eventful morning, there is much excitement and malicious fun among the bystanders, who are confidently expecting the discomfiture of his rider. Of course the accomplished Wynnerley asserts his supremacy with an easy grace that is all his own, and, cantering in a winner by many lengths, lands a heap of money that has been recklessly laid against him. Of a very different and more striking type is Tom Maizeley, "the English farmer" whom we have seen already as he rode up the lane past the stackyard. "There is nothing particular about him. He is only a steady-going, hard-headed, soft-hearted English farmer"; but we are glad to know that he is a representative man among many whom one may come across every day in an English hunting field. Maizeley will keep on the best of terms with the master of the hounds, who happens to be likewise his landlord and a liberal one, in spite of the efforts of Radical canvassers who try to persuade him that he is the victim of arbitrary oppression. He delights in the quiet enjoyment of a day's hunting, though he makes no pretension to being a brilliant rider. "He and his horse perfectly understand each other." He guesses the line the fox is likely to take as well as any man who follows the pack; he seldom jumps when there is a gate or a gap convenient; when he must get out of an enclosure, he prefers waiting till some more impetuous horseman clears the way; and, thanks to judgment, knowledge, or instinct, he is generally "there or thereabouts" at the finish. Finally, talking of instinct, we may single out, from among the portraits of professionals, Bill Heigh, huntsman of the Meadowmere. Bill was one of those boys who take naturally to the saddle, just as many lads have an irrepressible passion for the sea. The son of the gardener of the master of the hounds, he would play truant from his father's pursuits, for which he had no sort of vocation. Scrambling after the hounds on a notorious kicking pony, he attracted the notice of Maizeley the younger. Maizeley, who fancied the boy's pluck, mounted him on "a young one," when in turn he arrested the attention of the master. Not only did he ride with courage and judgment, but he showed a shrewd perception of the science of hunting in the remarks he made in his excitement when the hounds had come to a check. The master decided to utilize his precocious talent. He was installed forthwith as second horseman; was promoted to the dignity of whip, and from that to the glory of the huntsmanship; and there was but one opinion among the gentlemen of the Meadowmere as to the manner in which he discharged the duties of the post. We have merely selected some of the more characteristic sketches for notice; but the others, with hardly an exception, are almost equally good.

GERMAN LITERATURE.

AFTER all that has been written about Mozart (1), there might hardly have seemed room for yet another biography, especially one precluded by the very principle of its composition from containing anything new. Dr. Nohl, however, whose original labours in musical biography, with all their merits, are frequently too æsthetically profound to be readable, has for once produced a truly entertaining as well as instructive volume, by sinking his own personality as far as possible, and contenting himself with stringing together the copious notices and testimonies of contemporaries respecting the life of Mozart. These are fortunately so full and graphic as, with some necessary connecting links and an occasional elucidation of a doubtful point, to amount very nearly to a complete biography. Mozart's extraordinary innate faculty for music, comparable to the precocity of a Lawrence in painting or a Bidder in arithmetic, rendered him an object of public curiosity at so early an age that the details of his career are remarkably full so long as he continues an itinerant musician. His married life was less open to observation, and the interesting letters of his father cease altogether, while Mozart was himself no penman. There is, however, no lack of reminiscences and anecdotes, generally bearing the stamp of authenticity. By piecing these together, and judiciously preserving the language of the narrators, Dr. Nohl has been able, not merely to produce a consecutive narrative, but to represent Mozart as he actually appeared to the world around him. This is assuredly better than pages of subjective criticism, barely intelligible in the absence of the works under discussion. Dr. Nohl's own supplements and comments are inspired by the most impassioned admiration for Mozart, both as artist and man, and traces of dissatisfaction with modern musical schools are easily discoverable. His own portion of the book, indeed, wears too much of the air of a continual panegyric, but the fault was not one to be easily avoided. The acknowledgment of Mozart's venial weaknesses and imprudences, the latter mostly due to excessive generosity, does not require much space, and when it has once been made, hardly anything remains but admiration for the man who, more than almost any other man of genius, makes the impression of a wonderful natural phenomenon.

The loss of Alexander von Humboldt's (2) correspondence with his brother Wilhelm has always been a subject of regret. Living generally apart, and being at the same time greatly attached to each other, they must have maintained an epistolary intercourse during the greater part of their lives; but Wilhelm's letters to his brother have shared the fate of almost all the other correspondence addressed to the latter, and until a recent discovery in the family archives, none of Alexander's letters were known to exist, with the exception of some relating to his travels in America and Russia. Thirty-seven more, however, have now been found, chiefly written from Paris between 1819 and 1827, and almost entirely in French. They principally relate to private affairs, which from the position and pursuits of the writer usually possess general interest on the score of their relation to literature or science, and, in conjunction with the letters of travel previously published, make a very agreeable little volume, the interest of which is further enhanced by a well-written preliminary sketch of Wilhelm von Humboldt's life in its connexion with his more celebrated but not more truly illustrious relative. The contrast between the German and the French letters is a striking instance of the superiority of the former language as a medium of sentiment and feeling.

Dr. Finsch's expedition to Western Siberia (3) was a branch of the German Arctic expedition. It was evidently most diligently and successfully performed, and it is no fault of Dr. Finsch's if, in the absence of exciting incident, it shares in the usual monotony of travel in a cold and dreary region. The natural resources of Western Siberia are nevertheless considerable; and when the pressure of population begins to be felt in European Russia, Asiatic Russia will begin to be cultivated and populous. The most interesting part of Dr. Finsch's expedition relates to the valleys of the Obi and Irtisch, which are sometimes highly picturesque.

Otto Kaemmel's investigation of the original colonization of the German provinces of the Austrian Empire (4) by the Teutonic race has almost more connexion with Roman than with German history. The traces of Roman occupation are indeed more numerous and more easily followed than those of German settlement, which are principally to be collected from charters of the ninth century. Roman inscriptions and other remains, on the other hand, are numerous, and show that the originally Celtic population was as thoroughly Latinized as in Britain. The standard of civilization attained, however, does not seem to have been very high at any time, and falls off during the fourth century, after which date no more coins are met with. Slavonian tribes then overran the country, and have left their traces legible in the local terminology. During the eighth century they were for the most part converted to Christianity; in the following century a tide of German colonization set in, which bade fair to extend itself over the whole of the Roman province of Pannonia, when in 907 a terrible defeat from the Magyars, the most recent invaders of the country, threw it back to its present limits.

The attention already bestowed upon the English version of *Russia Before and After the War* (5) dispenses us from the necessity of noticing the original at length. The author is understood to be Julius Eckardt, so well known as an authority on the affairs of the Russian Baltic provinces.

The dismal story of the Czarewitch Alexis (6) is related with apparent impartiality by Professor Brückner. A more tragical situation than the execution of a son by his father for reasons of State could not well be conceived, were there any of that romantic element in the character of Alexis with which dramatists and novelists have managed to invest Don Carlos. In fact, however, the hapless Czarewitch is interesting only by his catastrophe, and the pity, largely leavened by contempt, which this excites is insufficient for tragedy. Peter exhibited an utter want of natural feeling, and his hypocrisy is as repulsive as his barbarity; nevertheless, apart from these accessories, his proceedings were justified, if not imperiously required, by the duty he owed his people. If, apart from his fate, Alexis excites any interest, it is as a type and summary of all the national qualities and propensities that make the diffusion of civilization among the lower orders of Russians so difficult an undertaking.

Dr. Pastor's (7) history of the various attempts at reconciliation between the Church of Rome and the German Reformers, which continued to be made until the Convention of Augsburg virtually acknowledged the incurable nature of their dissensions, is a very one-sided performance. He throws all the blame upon the German princes; and, admitting the religious character of the Reformation in its early stages, maintains that it soon became a mere question of the secularization of Church property and the subjugation of the ecclesiastical authority by the State. He takes no notice of the counter-reformation of the Roman Church under the influence of Loyola and Caraffa, the very principle of which was the impossibility of any compromise. His narrative, however, is extremely interesting, and even strengthens the impression of how great a misfortune it was that the Emperor of Germany should also have been King of Spain, and, as such, disqualified from availing himself of the noblest opportunity ever offered to a sovereign.

The title of Bishop Stepischnegg's book (8) is calculated to mislead. It is neither a biography of Pius IX. nor a review of his pontificate in relation to the age, but a chronicle of the most remarkable transactions between Church and State which occurred while he was Pope, especially in Austria and the German Empire. It may be of some value as a book of reference, but is devoid of literary pretensions, and is only preserved from utter insipidity by the amusing contrast between the author's unaffected horror at the slightest infringement of the privileges of the Roman Church in Prussia or elsewhere, and his undisguised complacency at every instance of the oppression of Protestants, particularly in Austria, during the evil days of the Concordat.

In struggling for the preservation of the Pope's temporal power, the Church of Rome has been fighting to retain what she would frequently have been better without. The Pope has not always been able to reconcile his interests as a temporal prince with his mission as head of the Church, and when the two have come into collision, the latter has commonly gone to the wall. The history of Pope Urban VIII. (9) affords a remarkable example. As Pope it was Urban's business to put down the Reformation by all possible means; as Prince he was much more concerned to deliver himself from the tyranny of Spain and Austria, and he scarcely dissembled that he regarded Gustavus Adolphus as the instrument of his deliverance. His lukewarmness in the Catholic cause brought upon him at last a solemn protest in full consistory from the Spanish Ambassador, Cardinal Borgia, and the scandal thus created is the principal subject of Herr Gregorovius's very entertaining little volume. After three years of fruitless efforts to obtain satisfaction from the Cardinal, Urban at length gained his point to some extent by issuing an edict enjoining bishops to reside in their dioceses, in obedience to which Borgia was compelled to return to Spain. The character of this Pope is vividly drawn by Gregorovius. Worldly, martial, and ostentatious, he made a considerable figure as a temporal ruler; but ecclesiastically he marks the dying out of the ascetic and crusading spirit which, under the stimulus of the Reformation, had prevailed in the Roman Church since the middle of the sixteenth century.

It is astonishing how much Herr Tollin finds to say, or rather to write, about Servetus (10). To a volume on his relations with Luther, and another on his relations with Melanchthon, is now added another on his relations with Martin Bucer. There is really not much to be said about them. Bucer was naturally alarmed at the scandal which the heresies of Servetus were calculated to bring upon the Reformation, and took care to discourage them and dissociate himself from them; but he was himself a very liberal theologian, and Herr Tollin is probably correct in considering that his interference was chiefly dictated by motives of policy. This is really nearly all he has to say, and it seems incomprehensible how he should have been able to say it at such length.

G. Roskoff (11), the author of a valuable work on the superstitions connected with demonology, investigates the much debated question whether any savages are entirely destitute of religious ideas. He energetically maintains the contrary, pointing out that nearly all the affirmative evidence on the subject is derived from the accounts of missionaries and others whose own conception of religion was exceedingly narrow, and who in fact only intended to convey that the barbarous people described by them were destitute of religious notions analogous to their own. Sorcery involves the conception, however rudimentary, of superhuman power capable of being invoked or propitiated, and sorcery in some shape or other is practised by every uncivilized people. Religious ideas, nevertheless, are not innate; they are inferences inevitably forced upon man by his perception of his feeble and dependent condition, of which no savage is too savage to be conscious.

Professor Zöckler (12) is one of the few writers who, in the face of accumulated proofs of the rude and barbarous condition of primitive man, continue to maintain that he was created in a state of civilization. He seems to have read everything that has been written on the subject, but to be incapable of turning his erudition to any good purpose.

The method of Dr. Räbiger's "Encyclopædia of Theology" (13) is mainly historical, conveying a clear and comprehensive account of the developments which theology has undergone at various periods, with a review of the most important works in its various departments. A preliminary essay treats of the definition and principal departments of theology, its relation to the other sciences, and the chief theological schools.

The late Dr. Albert Peip's (14) lectures on the philosophy of religion probably have been published out of respect for his memory; since, although learned and interesting, they contain little that has not been already frequently expressed in some shape or other. They include a criticism of the evidences of natural religion, and an account of the principal ethnic religions.

Victor von Strauss's essays on religion (15) relate principally to the Oriental religions, especially that of Lao-Tsé, of which the writer, whose own point of view is nevertheless strictly Christian, entertains a very high opinion. Professor Max Müller's essays are also the subject of a dissertation, and the entire collection is prefaced by an essay on Christianity as a divine revelation.

The economical history of England during the middle ages has attracted almost more attention on the Continent than in England itself, and become the subject of standard works by Brentano, Nasse, and others. Dr. Ochenkowski's essay (16) is an additional contribution to the subject, of especial interest from the extensive survey taken by the writer, which comprises agriculture, manufactures, internal trade, and international commerce. Dr. Ochenkowski's especial point of view is the conception of the mediæval epoch as a period of transition, and of the development of a primitive economical system into a complicated one. He especially insists that the object of mediæval statesmen was different from that of modern economists, that the aim of their legislation was not so much to favour the general accumulation of wealth as to prevent the impoverishment of any class of the community. Protective legislation was not designed to benefit the country at the expense of its neighbours, but to keep the particular class of artisans affected at a certain level of comfort; and the encouragement frequently afforded to foreigners was rather intended for the encouragement of population than of industry. On the whole, he thinks there was less selfishness and more rough common sense in mediæval economics than is usually allowed.

Dr. Lübke's "History of Italian Painting" (17) is a highly meritorious work in its way—copious, accurate, and accomplishing its object in a manner which leaves little to be desired so far as the mere communication of information is concerned. Its defect is the writer's incapacity to vivify his material; the execution is formal and prosaic, and nothing but the interest of the subject redeems the book from absolute dulness. It is an excellent catalogue, but hardly a work to be read. The plates also are tame and mechanically executed, too much restricted to a single class of subject, and for the most part old acquaintances.

The first part of Herr Prölsz's (18) history of the modern drama is divided between the beginnings of the modern drama in general and the drama of Spain in particular. His analysis of the latter is chiefly founded upon Schack's, but is nevertheless, or perhaps on that account, an excellent and discriminating piece of criticism. He points out that Calderon was the most Oriental of the Spanish dramatic poets, and that his affinity to the national genius in that respect obtained him the preference over his more regular and classical competitors.

Karl Gutzkow's posthumous novel, "The Paumgärtners of Hohenschwangau" (19), is a romance of the period of the Reformation, and in some degree a sequel to a former work. It is full of movement and incident, although the author's laudable efforts to render it a true picture of the period give it somewhat too much the air of a compilation from musty books. It was left unfinished, and the third volume has been added by another hand, to the satisfaction, we are informed, of the publisher, but perhaps not equally to the satisfaction of the public. One of Gutzkow's merits is ease of dialogue; the continuator avoids dialogue as much as he can.

The March number of the *Rundschau* (20), somewhat less interesting than usual, contains the commencement of a new story of Swiss life, "Lotti the Watchmaker," something in the manner of Gottfried Keller; and a pleasant sketch of Tyrolese manners and customs by a great authority on the district, Ludwig Steub. [illegible] history, allowing him great eminence as a diplomatist, denying him high rank as a statesman, admitting his services in the war with Napoleon, but condemning his repression of all liberal tendencies and national aspirations during the thirty years of his supremacy, which might have been so fruitful for good in other hands. The reminiscences of the Polish insurrection of 1863 are concluded in an article chiefly remarkable for a rebuke, significant in view of the present uneasy relations between Russia and Germany, of the former country's forgetfulness of the services rendered by the latter as a sentinel over the insurgents, services certainly inglorious and disagreeable enough to have earned the gratitude of the Power in whose behalf they were rendered.

THE COMING CONTEST.

NEXT week the fight will really begin, and the busy time of preparation will be over. During the last few days there has been interminable speechifying, for the most part of an unedifying sort, profuse expenditure, and a little free-fighting. Sir STAFFORD NORTHCOTE professed to like the disorder which awaited him in Hackney. It reminded him of the good old days when the frank humour of the mob had its swing, and men broke each other's bones for the love of their common country. The farther off these good old days get the better for every one, and peaceable men of all parties who like honesty and spirit will lament that Mr. COWEN has been a conspicuous victim of this ancestral violence. But in one way this playfulness of ruffianism has its good side, for it is a symptom of the general interest which the elections excite. Whoever may win, it is at least certain that the contest will have been well fought. Wherever there is a hope there is a hard struggle, and even where there is no hope there is the animation of hoping against hope. There is to be a contest wherever a contest seemed possible, and there is even to be a contest where a contest might have been thought impossible. Mr. HERBERT GLADSTONE relies on his youth, his name, and a friendly subscription to contest the Conservative stronghold of Middlesex. An adventurous spirit has dared to challenge Lord EDMOND FITZMAURICE at Calne; and a still bolder spirit, confiding in the thought that a man who can edit an Indian paper can do anything, has ventured to break the solemn stillness of that home of indignant wisdom, the Elgin Burghs. Even family ties have been rudely snapped, and the sentiment uttered by Mr. GLADSTONE, that an honest politician should oppose his nearest and dearest, has found expression in Marlborough, where the house of BRUCE is divided against itself, and the electors will have to exercise the nicest discrimination between the Christian names of an uncle and a nephew. In this fierce contest, who will win? The simplest answer is that no one knows. Both parties are very confident, and each seems to have good ground for confidence. That both can be right is impossible; but it is quite possible that each should have good grounds for thinking it is right. The Conservatives are very united and very determined, not to say furious, and many more Liberals have gone over to them than Conservatives have gone over to the Liberals. Many people must know among their acquaintances as many of these Liberal defections as would at least equal in amount the electors of an Irish borough. On the other hand, the Liberals can point to many constituencies traditionally Liberal which went over at the last election and which may be expected to be reclaimed; and the three sections of Liberals—the section of the type of the SPEAKER, who say that, "after all, they cling to the party "of political progress"; the section of the HARTINGTON type, who are sure that their favourite will always uphold the honour of the country, and hope that he will sit comfortably and firmly on his own tail; and the section of the GLADSTONE type, who have at least gone so far as to read and profoundly admire one in fifty of Mr. GLADSTONE's speeches—are all, with few exceptions, working harmoniously and vigorously together.

The elections must for the moment be regarded from an electioneering point of view, and every one must be taken to be not a Conservative who on some conceivable issue would join in trying to turn out the present Government. This, it may be observed, is different from the political point of view; for on such questions as foreign policy and concessions to Ireland a large number of Liberals would vote with the Conservatives, and on such questions as the Irish franchise, the county franchise, county government, and the alteration of the land laws, it will always be open to the Conservatives to outstrip their opponents and once more dish the Whigs. But for mere temporary electioneering purposes the only question is how far the present Ministerial majority will be sustained, increased, diminished, or annihilated. And at the outset it must be owned that in any calculation of the results there are two dark quantities. These are the publicans and the farmers. Any one who walks the streets of London would think that there were no Liberals left in the metropolis. Every public-house from basement to garret is adorned with Conservative placards. Curiously enough, milk and tobacco seem to be strongly Liberal. But what is a man with a modest little cow or a rickety Highlander over his door to his gorgeous neighbour, whose gas glares and whose beer flows in perennial honour of Conservatism? The doubt that the publicans suggest is whether they have not a little overdone the splendid homage to the Crown, the Altar, and the Tap, whether they have not roused some little indignation by their effusiveness, and whether there are not some quiet people who, under cover of the Ballot, will show that they resent what they consider to be the arrogant obtrusiveness of beer. As to the farmers, we know of no reason to suppose that they have turned Liberal, except that, to look at the threatened contests, there must be people who are willing to spend a large amount of money on the speculation that the farmers have become Liberal. In the Home counties especially, which have hitherto been reckoned strongholds of Conservatism, contests are to be fought which, if the statistics of the last general election are to be taken as a guide, seem hopeless. There is to be a contest in East Essex, where two Conservatives were then returned unopposed. There is to be a contest in South Essex, where the Liberals were last time 800 votes below their opponents. There is to be a contest in all three divisions of Kent, whereas in 1874 six Conservatives were easily returned; and out of the three divisions of Surrey two are to be contested, in one of which there was in 1874 no contest, and in the other of which so well-known and highly esteemed a Liberal as Mr. LOCKE KING was defeated by about 1,300 votes. In counties far away, as in two divisions of Cheshire, there are contests of a similar kind to take place. Such contests are of a totally different kind from that of Lord HARTINGTON in North-East Lancashire or that of Mr. GREY in South Northumberland; for there a powerful and recognized Liberal interest is trying to assert itself now as it has done before. It is the contests waged in purely agricultural counties, where Conservatism is triumphant, that deserve attention. Very possibly the Liberals may be beaten all round, and it seems to us safest in making any calculation to suppose that they will be so. But Liberal agents have at any rate persuaded candidates to think that it will not be so; and it may safely be said that, if the Liberals could make any serious impression on the English counties, they would very soon be in office.

Any estimate of the result of the elections must be pure guesswork. All that can be done is to see what chances either party has, and a party may be said to have a chance in any of the following cases. The majority at the last election may have been a very narrow one; or there may be a good candidate on one side and a weak one on the other; or the constituency may on the last occasion of voting have departed from long or strong convictions; or local influence may have changed hands; or one of the parties may be divided by having more candidates than it can possibly carry. For example, in 1874, at Bath, a Conservative got in by a majority of six; another got in at Bedford by a majority of four; another was returned for Thirsk by a majority of one; and a fourth at Northallerton by a majority of seven. In all these cases it is natural to suppose that a Liberal may now have a good chance. This is all that can be said by those who do not know the particular constituencies. In each of the four cases the Conservatives may now not only retain but increase their majorities. Southwark supplies an instance of the chance that depends on the comparative strength of the candidates. For Mr. COHEN is a very strong candidate, and Mr. CLARKE has most unfortunately been prevented by sudden illness from doing justice to himself and his party. Brighton, Cambridge, Devonport, and Falmouth afford examples of constituencies which last time suddenly changed their opinions, and which those who were then defeated hope, vainly or not, to win back. In the Tower Hamlets, at Northampton, Peterborough, and Kidderminster, there is a superfluity of Liberal candidates, and at Gloucester and Leicester there is a superfluity of Conservatives. Marlborough supplies a conspicuous instance of a constituency where it is at present an open question whether local influence has changed hands; and perhaps the same may be said of Abingdon, Andover, Barnstaple, Clitheroe, and Westbury. Then, again, there is Birmingham, where it is hard to believe that the organization of the Liberals can for ever keep out a minority member; and in some large constituencies, and especially some of the metropolitan boroughs, there is to all appearance a tide of opinion just now flowing that may slightly or largely alter the representation. Adding up all these chances on either side, it would appear that there are in England and Wales about forty-five seats which the Liberals may hope to win, and about thirty which the Conservatives may hope to win. This does not at all mean that the Liberals will, on the whole, win fifteen seats. It merely means that, principally because they were defeated last time, and often by small majorities, they have on abstract electioneering principles more to gain than their opponents. In Scotland almost every Conservative county seat is being attacked. There are no less than 17 county contests, and it must be remembered that in 1874 Dumbartonshire was carried for the Conservatives by 53 votes, South Lanarkshire by 21, Roxburghshire by 26, and Stirlingshire by 44. It may be added that among Scotch boroughs the Ayr district was carried by 14 votes, and Wigtown by 2. On the other hand the Liberals only carried Caithness by 11 votes, Kircudbrightshire by 4, and Renfrewshire by 8. Where majorities were last time so small, each party that lost then must be held to have a fair chance of success now. But unless Scotch Liberals are altogether wrong, a strong tide of Liberal opinion has lately swept over Scotland, just as we know a strong tide of Conservative opinion swept over Lancashire and the South of England in 1874. No one can say how strong the Scotch tide is; but it may perhaps approximate to truth to say that the Liberals have a chance of winning fourteen Scotch seats, and that the Conservatives have a chance of winning four. As to Ireland it is almost impossible for any one in England even to go so far as to guess on any principles what is likely to happen. We know that men like Sir GEORGE BOWYER and Lord ROBERT MONTAGU have had to retire, that the Home Rulers are quarrelling amongst themselves, and that Conservatives have had to give way on the land question if not on that of Home Rule. If the same bases of calculation were to be applied to Ireland as have been applied above to Great Britain, it might perhaps be said that the Conservatives have a chance of losing thirteen seats and gaining five. But it is idle to speculate about Ireland, and all that can be said is that the Home Rulers believe, or affect to believe, that the loss to the Government will be considerably greater than that of eight seats. At the end of all calculations we get no further than that the Opposition, used in the most vague and general sense of the term, has a prospect of gaining in Ireland and Scotland, and that, as to England, the secret of the election lies in the bosoms of the electors.

MR. GLADSTONE ON DISESTABLISHMENT.

MR. GLADSTONE may perhaps have confirmed in Midlothian the local conviction that the Government is weak, wicked, and corrupt; but, as all the votes which he is likely to influence were already secured, a victory which consists in slaying the slain has little practical value. It is possible that even on some Scotch minds his violent and voluble rhetoric may have produced the same impression which is widely felt in England. Probably the great majority of the educated classes now believe more firmly than they did previously to the two oratorical circuits in Midlothian that, either as a Minister or as a patron of a Ministry, Mr. GLADSTONE would be the most dangerous of living statesmen. He has not on the present occasion repeated, if he has not retracted, his anarchical suggestion that all property in land is, subject to pecuniary compensation, held on the sufferance of the Parliament for the time being. His wanton insult to the Austrian Government and nation is a more conclusive proof of his unfitness to direct the national policy. Lord BEACONSFIELD is often apparently careless in his political utterances; but he has probably in his whole life never approached the extravagance of Mr. GLADSTONE's wanton denunciation of a friendly Power. It is not certain whether the attack on Austria was the result of personal irritation at an absurd newspaper report of language addressed by the Emperor FRANCIS JOSEPH to the English AMBASSADOR. He might have assumed, as the fact was, that the EMPEROR had spoken with dignified propriety, and in any case he ought to have abstained from an ill-bred retort. The ill feeling against an ancient and valuable ally to which Mr. GLADSTONE sought to pledge his countrymen and a future Liberal Government was probably a result of various causes. He once disliked Austria as the chief opponent of Italian unity; and he now fears that the same Power may interfere with the growth of Slavonic power and with the supremacy of the Greek Church in the East. The complaint that METTERNICH had opposed the establishment of Belgian independence was deliberately offensive on the eve of the CROWN PRINCE's marriage with a Belgian Princess. A similar objection might be justly taken to Mr. CROSS's language with reference to Russia; but there is a distinction between an ally and a diplomatic antagonist; and Mr. CROSS has no mission to represent the foreign policy of a party. In the domestic controversies with which Mr. GLADSTONE is more familiar he constantly commits the rhetorical error of trying to prove too much. Even a Scotch Radical must sometimes reflect that the chances are enormously against the truth of the proposition that the Government is always and everywhere in the wrong. In one of his speeches Mr. GLADSTONE boasted that, if he hit hard, he fought fairly. He is apparently unconscious of the gross injustice of attributing to Sir STAFFORD NORTHCOTE the alleged anomaly of the exemption of real property from probate duty. The factious sophism of assuming that the farmers are especially wronged by a tax on personalty is intended to widen the differences which may already exist between tenants and landlords.

Reasonable curiosity was excited by Mr. GLADSTONE's announcement that he would on Monday last expound his opinions on the question of disestablishment of the Church of Scotland; but those who have studied his mode of thought anticipate additional obscurity whenever he undertakes to be explicit. On several occasions Mr. GLADSTONE has lately made the whimsical complaint that disestablishment has during the present contest been more often mentioned by its opponents than by its promoters. It is strange that he should be surprised at efforts to expose the conspiracy of silence in which he and the other enemies of the Scotch Establishment have deliberately engaged. They are aware that some votes may be lost by hostility to the National Church, and that none can be gained, because the assailants are without exception members of the Liberal party. The blunder into which Lord HARTINGTON was two or three years ago led by Mr. ADAM has never been in-

tentionally repeated, though it could not be cancelled. The experienced Liberal manager of elections had for once made a serious miscalculation in overlooking the fact that some members of the Established Church had up to that time been Liberals. Either Mr. ADAM or Lord HARTINGTON was responsible for the further menace to the English Church contained in the announcement that no consideration for its security would deter the Liberal leaders from sacrificing the Scotch Establishment to [t]hose popular clamour. No one who has watched Mr. [GL]ADSTONE's recent career doubts that he would welcome the opportunity of destroying the Establishment either in England or Scotland. He is never weary of proclaiming the moral superiority of Nonconformist ministers to the English clergy; nor has he ever repudiated the unbounded confidence which is reposed in him by preachers of all denominations. He lately praised the Dissenters for the reticence which they practise during the present contest on the subject in which they are principally interested. They are on their part satisfied that his gratitude for their provisional silence implies a promise to gratify their demands as soon as opportunity occurs. Nearly two-thirds of his Midlothian speeches have been delivered in Free Church places of worship, placed at his disposal by elders and ministers who trust that he will in due time avenge them on their enemies of the Establishment.

The promised disclosure at Gilmerton consisted in a literal repetition of phrases which are unconsciously significant. After the usual remark on the supposed perversity of the friends of the Establishment in calling attention to the danger with which it is threatened, Mr. GLADSTONE once more declared that the question was not immediately urgent, and that, when it might hereafter come to the front, it would be determined in accordance with the wish of the people of Scotland. He drew at great length a distinction between the Irish Church, which he stigmatized as alien and anomalous, and the Scotch Church, which had before the disruption of 1843 been, as he says, supported by a majority of the people. No Manchester murders and no Fenian explosions were needed to produce in Scotland the beneficent result which had been attained in Ireland; and incidentally Mr. GLADSTONE repeated the explanation that it was on the popular mind, and but indirectly on his own, that the Fenian outrages had so effectively acted. Perhaps Mr. GLADSTONE had really failed to understand the analogy which has been suggested between his past achievements and his possible conduct in the future. None of his critics have supposed that the Free Church agitators would blow up prisons or murder policemen; but they remarked that it had only taken three years to remove the Irish Church, in Mr. GLADSTONE's estimation, into the region of practical politics; and that his convictions on the Scotch Church might perhaps ripen as fast. If he had been under cross-examination in a court of justice, he would have been sharply reminded that he had not answered the question whether he would support disestablishment; but in this case, as in many other instances, reluctance to give evidence is in itself a sufficient answer. It would be discreditable to a statesman of the highest rank, peculiarly interested in ecclesiastical matters, not to have made up his mind on the subject of destroying the most important institution in the country. If Mr. GLADSTONE had not been converted to the doctrines of the Liberation Society, he would not have affected to make his future action conditional on the decision of a future majority. He will of course not destroy any Church, as long as the House of Commons is disposed to maintain it. It is not in this way that he deals with the issues of foreign and domestic policy, which are nevertheless not more important [t]han the maintenance or abolition of the Church.

It would have been easy for Mr. GLADSTONE to say that he retained the opinion which he formerly held, that the Church of England at least ought to be defended against all encroachment. The eagerness with which he assured an inquisitive Dissenting preacher that he was opposed to all further endowments contrasted strongly with his silence on the question of the Establishment. There was in this instance no contention that the question had not become pressing, though nothing can be more improbable than that any such application of public money will be at any time proposed. Mr. GLADSTONE had on this point an opinion of his own; and he was ready to avow it, without waiting for instructions from an electoral majority. It is uncertain whether the Scotch Established Church has any considerable influence in the constituencies, though it is evident that Mr. ADAM no longer instructs his candidates to alienate any votes which it may control. The English Church, according to Mr. GLADSTONE's questionable statement, is still further in the political background, but those with whom its maintenance is a social and political object of the first importance are powerful by their influence and not contemptible in number. They have now, notwithstanding Mr. GLADSTONE's implied disclaimer, received sufficient warning of his opinions, if not of his intentions. They will not even be greatly reassured by the statement that the next Parliament is to occupy itself mainly or exclusively with the extension of the franchise, with the imposition of restrictions on the exercise of ownership in land, and with the transfer of rural authority from justices to elected bodies. It is not impossible that the Nonconformists may become impatient of the postponement of their demands, after a victory which, if it is achieved, will be largely due to their co-operation.

EUROPEAN QUIET.

WHILE we are having so much excitement at home, a spell of profound quiet seems to have come over Europe. There appears to be nothing whatever for Special Correspondents to telegraph. In despair one sends the dimensions of the villa at Baden where the QUEEN is to stay; and another flashes the important announcement that M. GAMBETTA has been advised to give up smoking. This is soothing and refreshing after the disturbing announcements to which we were lately accustomed—movements of troops, projects of new alliances, and deadly attacks on sovereigns. To this happy result every considerable Continental Power has in some measure contributed. France has done something by showing that she neither courted the friendship nor feared the wrath of Russia. In Italy the long debate on foreign affairs ended in the adoption of an order of the day which advocated a policy firm at home and pacific abroad; and this policy was immediately illustrated by the unconditional acceptance by Italy of the Egyptian Commission of Liquidation. Austria lives in a chronic state of Ministerial crisis; but the PRIME MINISTER manages to get along by yielding a little all round, and promising to be very economical. Even in Germany there is a seeming relaxation in the rigour with which not only the Falk Laws, but the laws against the Socialists, are administered, and a Socialist deputy has actually been acquitted in face of the vehement oratory of the Public Prosecutor. Russia has fallen into the arms of Germany, and has begun under stern compulsion to attend to her own business. The strange plan of having a real Czar to be shot at and to govern while the titular Czar eats and drives about under a system of minute precautions, seems for the present to be answering. General LORIS MELIKOFF is now supreme, for the famous Third Section has ceased to exist, and its mysterious and terrific powers are centred in him alone. The Dictator is, however, doing something more than dictating. He is cautiously introducing reforms. Some semblance of life is being imparted to local institutions. We read that at Smolensk the Marshal of the Nobility communicated to the Assembly over which he presided a circular from the MINISTER of the INTERIOR, announcing that the right of Governors to refuse to confirm the elections of District Marshals of the Nobility, on account of their being supposed to be ill affected towards the Government, had been annulled by Imperial order. It is difficult for foreigners to estimate the importance of the announcement; but, at any rate, those to whom it was addressed, and who may be supposed to understand it, received it with a burst of enthusiastic applause. A raid, too, seems to have been made on the erring officials who have been the curse of the country and the chief cause of the distrust which has been shown towards the Government. Of course, as in all such outbreaks of virtuous indignation, great people are overlooked and little people are caught. It does not seem much that a railway official has been sent to Siberia, and that a lawyer has been deported. The people who really robbed the Russian army were much higher up in the scale than that. But it is something that any official should be punished for anything, and sanguine Russians

may hope that influential plunderers, if they have not had a punishment, have at least had a warning.

Among the causes that have contributed to the present state of European quiet, the altered disposition of Russia and the persistent moderation of Austria may be reckoned as the most important. The explosion in the Winter Palace warmed into expansive sympathy the affection of the German EMPEROR for his nephew. On his side the CZAR was ready to give a conspicuous proof that he was not coquetting with France. Prince ORLOFF is too experienced a diplomatist not to have acted under instructions; and if his instructions were at once to make the extradition of HARTMANN a personal matter between Russia and France, and yet to take care that the extradition could not possibly be effected, he has faithfully and punctiliously obeyed them. But Prince BISMARCK gave a helping hand. He allowed to be blazed over Europe one of those non-official communications by which he sets in motion the wheels of his changing policy. He hinted with contemptuous good humour that France was sure not to surrender HARTMANN, for the French Government is young and weak, and only solid and old-established Governments can afford to do their duty to threatened sovereigns. He thus encouraged Russia to treat the surrender of HARTMANN as a question, not of law and justice, but as one dependent on the character of the Government to which it was addressed, and at the same time hinted at the quarter in which the CZAR might find a steady and useful friendship. The reconciliation of Germany and Russia may be primarily the work of the sovereigns, but it has had more or less the approval of Prince BISMARCK; and if Prince GORTCHAKOFF dislikes it, he is now so evidently shelved that his views are comparatively unimportant. To be friendly with Germany is, at the present time, for Russia to be on good terms with England. The CZAR, at a recent audience, appears to have signalled out Lord DUFFERIN as the especial object of his most cordial attention, while he treated General CHANZY as NAPOLEON used to treat the diplomatists whose presence he just consented to tolerate. The chances of collision between England and Russia in the East grow daily less. General SKOBELEFF has at last consented to take the command of the expedition against the Turkomans; but it seems to be understood that the means at his command will not suffice to do more than give the Turkomans a lesson, and probably to occupy and fortify posts along the line of communication. On the other hand, Lord CRANBROOK has announced that all projects for handing over Herat to Persia are in abeyance, if not finally abandoned. The transfer of Herat to a nominee of England would naturally have provoked Russia to seek for compensation in the northern provinces of Persia, and England could scarcely have been under a greater disadvantage than to have to encounter Russia on the borders of the Caspian. If Russia and England continue to walk in the paths of common sense, there is no immediate reason why the peace of Asia, any more than the peace of Europe, should be disturbed.

The recent action of Austria has been even more important in contributing to quiet than any change in Russian policy. In fact, it may be surmised that the change in Russian policy is in a great degree due to the action of Austria. It is perhaps affectation to express surprise at anything Mr. GLADSTONE can say; but still it is impossible not to feel some astonishment at the language which Mr. GLADSTONE has used about Austria. Experience has long ago shown that Mr. GLADSTONE could pass five years as Prime Minister without acquiring the knowledge of Continental affairs which it might have been thought must have come without effort to a man in such a position. But it is still wonderful to find that he has not even the knowledge of the ordinary reader of a penny newspaper. He seems to think that Austria is still the Austria of Prince METTERNICH. The kind friends who surround him appear to have managed to get into his head the fact that Austria has become a constitutional country at home; but it would have needed a surgical operation to introduce the idea that the foreign policy of Austria is as much changed as her home policy. Dates make no kind of difference to him, and he spoke quite comfortably about Austrians in Belgium, where no Austrian has been during the present century. He warned the Hungarians against their immoderate love of dangerous annexations—the Hungarians, of all people, who have with great difficulty been persuaded to acquiesce in the occupation of Bosnia and Herzegovina, and who have fought over every penny which they considered was being taken out of the country and spent abroad. If we are to speak of all the subjects of the Emperor of AUSTRIA as Austrians, then we may safely say that it is the Austrians who have in the most resolute manner shown their determination to keep Austria out of all costly adventures. Their cry, day after day, has been that they cannot afford to run risks. They might have honestly hoped that they would be recognized as devotees of Peace, Economy, and Reform after Mr. GLADSTONE's own heart. The exhortations to Austria to be up and doing come entirely from the outside. Austria herself turns a very deaf ear to these exhortations. She does not appear to be at all enamoured of the idea of making Pesth the centre of her activity. To visions of domination over the Balkan peninsula and sovereignty in the Ægean, she mildly replies that the realization of such grand projects looks as if it would cost something, and that Austria has not a florin to spare. Austrians think much more of the Arlberg Railway than of the Gulf of Salonica. The great charm of the German alliance is to them that it affords a hope that some day they need not spend quite so much on their army. And not only is Europe thus relieved from the fear of Austrian rashness, but it is obvious that the present attitude of Austria must exercise a considerable effect on the relations of Germany and Russia. If Austria will not consent to be pushed forward by Prince BISMARCK, then Austria gives by her alliance something useful to Germany, but not nearly so useful as might have been hoped. On the other hand, Russia feels more at ease about Austria, and therefore about Germany as the guide and guardian of Austria. Room is thus made for the revival of an old friendship, and so long as Prince BISMARCK allows Germany to be on good terms with Russia, there is no fear of present disturbance in Europe. Thus there is now quiet in Europe, and Europe has largely to thank Austria, and especially Hungarian Austria, for this pleasant state of things.

ELECTION PROSPECTS.

THE innumerable speeches which fill the columns of the newspapers will probably have little effect on the election. As candidates only address their respective supporters, their arguments and their declamations confirm existing opinions and prejudices, or, at the worst, leave them unaltered. Readers of reports have the advantage of comparing, if they think fit, conflicting statements or reasons, but they also have with few exceptions long since made up their minds. Still the ubiquitous debate is in some respects not uninstructive. The issues raised are those which in the judgment of the speakers are likely to decide the contest, and the mode of treatment approximately represents the supposed predilections of the various constituencies. Mr. GLADSTONE's encyclopædia of party rhetoric is an exception to ordinary rules, though he also has corrected, in deference to public opinion, some of the more extravagant errata of his autumn edition. It is doubtful whether foreign politics will enter so largely into the consideration of the electors as if the dissolution had occurred one or two years earlier. The Turkish war and the Treaty of Berlin are passing into the background of popular interest, though the Government is still thought by friends and opponents either to have displayed commendable spirit or to have engaged in a hazardous and costly policy. Nevertheless the Government and its supporters have won a great moral victory, though they may lose its fruits through the rapid conversion of their adversaries. Every Liberal candidate, including the leaders of the party, now dilates on all occasions on the courage and patriotism with which, as they contend, they have in former times vindicated the honour and power of the country. The clamour against the policy which was nicknamed Imperialism has so wholly subsided that careless politicians almost forget how Mr. GLADSTONE recommended that England should, like women in ancient Greece, be neither seen nor heard in the councils of Europe. The proselytes or penitents who now assume an ambitious and almost warlike tone virtually admit, not indeed that Lord BEACONSFIELD and his supporters were in the right, but that they judged correctly of the temper of the English nation. The flattery

of imitation is the more delicate and gratifying when it is unwillingly offered.

The elections will be less a conflict of opinions than a trial of party strength, impaired or reinforced to a certain extent by the intervention of minor organizations. The Conservatives are, as usual, all of one mind, and the Liberals are more generally united than at the last election. Some of the special auxiliaries on whom they rely are both strong in numbers and zealous in support of the Liberal cause. All the Dissenting preachers, and the bulk of the Dissenting laity, will exhibit the zeal for the Liberal cause which has long made them favourite objects of Mr. GLADSTONE's adulation; but it is doubtful whether they ought not to be counted as part of the main body rather than as mere allies. From the numerous body of advocates of abstinence or of local option must be deducted, for purposes of calculation, the large section which is already reckoned under the head of Nonconformists. The residue will, on the ground that the adverse party is unanimously hostile to their claims, condone the disclaimers of sympathy with their opinions which the Liberal leaders incessantly repeat. The Irish voters in the large towns will throw the whole of their not inconsiderable weight into the scale of the Liberal candidates. Their managers, taking warning by the Liverpool election, have directed that no questions should be asked, and that the Home Rule vote shall in every instance be given against the Government. They are probably not troubled by a doubt, which must press on the minds of Liberal candidates and agents, whether their alliance may not sometimes be rather a loss than a gain. In spite of indignant protests, many simple-minded electors will suspect that the zealous friends of the Liberal party are not at the same time its irreconcilable opponents. The commonplace statement that the Union will be best preserved by justice to Ireland implies a promise of something more than an equalization of the Irish Parliamentary franchise with that of England. It must be inconvenient to a respectable candidate to find himself on the same side with Mr. BIGGAR, who lately expressed a hope that an Irish HARTMANN would be found, apparently to assassinate the QUEEN.

The Conservatives also count on the support of special classes which have no necessary or permanent connexion with the party. The small but powerful body of Jews, once unanimously Liberal, is now perhaps equally divided. The Jewish sympathies which were attracted by the foreign policy of the Government have not been reclaimed by Mr. GLADSTONE's vituperation. His proposition that the Jews of Servia and Roumania could not expect to escape persecution if the Jews of Sheffield voted against Mr. GLADSTONE's candidate has probably not been forgotten. The sneers directed by Mr. LOWE and others against the Semitic descent of Lord BEACONSFIELD are not unlikely to have affected Jewish susceptibilities. The Roman Catholics also, and especially those of rank and fortune, are generally transferring their allegiance to the party with which, but for their own former disqualifications, they would naturally sympathize. Mr. GLADSTONE's Vatican pamphlets, though they really expressed his disappointed sympathies with Rome, may probably have given offence to zealous Catholics; but the cause of their present political tendencies lies much deeper. It is not certain that the change will largely affect the result of the election. The great mass of Irish Catholics resident in England have no connexion with the gentry belonging to the same creed, and they will be guided rather by the Home Rule managers than even by the priests. It must also be remembered that two English Roman Catholic prelates, one of them belonging to an ancient English family, have lately published inflammatory denunciations of the administration of Ireland. The farmers will, as a body, remain true to their familiar colours, though many attempts have been made to disturb their party allegiance. A few tenant farmers will be returned by constituencies generally careless of politics, and anxious to obtain concessions from the landlords; but for the present there is no considerable defection, and the farmers distrust the party which, as soon as it succeeds to power, will take out of their hands the entire county representation.

The league of licensed victuallers is likely to be as formidable as at the last election. Mr. BRIGHT's adroit efforts to conciliate the Birmingham members of the trade appear to have been unsuccessful, though one of them asserted, perhaps truly, that half their number were already Liberals. He probably reserved the fact that, like the nobleman who compared the claims of his sect and his country on his allegiance, they were licensed victuallers first and Liberals afterwards. Mr. BRIGHT's arguments in favour of Sunday closing appear not to have convinced an audience which understood the fallacy of the precedent which he deduced from the example of other traders. A grocer or a draper might probably not sell an additional article in a week if his shop were open seven days instead of six. A man who buys a pair of gloves on Saturday, does not require another pair on Sunday; but he is extremely likely, if he takes a pint of beer on one day, to require another pint on the next day. The publicans perhaps care as little as Mr. BRIGHT himself for the convenience of the multitude of consumers who would, if all places of entertainment were closed, be unable to obtain either rest or refreshment except in their own homes; but the licensed victuallers knew that every shilling which they might be prohibited from earning on Sunday would be a dead loss. They also regarded with suspicion Mr. BRIGHT's remark that the suppression of a certain number of public-houses would consolidate the monopoly of the rest. In the present day monopolies, though they are extremely profitable to their owners, have the serious disadvantage of being invidious and precarious. If Sir WILFRID LAWSON could shut up half the public-houses in the kingdom, he would agitate with much greater force against the privileged remainder. The publicans will not be discouraged by the twofold recognition of their importance on the eve of an election. Mr. BRIGHT undertook to protect their interests, or at least to secure them compensation; and Mr. CHAMBERLAIN publicly announced his abandonment of the Gothenburg scheme. It was not clear what result Mr. BRIGHT expected from the transfer of the licensing power from the Justices to the Corporations; but the publicans would deprecate the change. At present the proceedings are judicial. Corporations represent the popular local opinion, and too often, and more especially at Birmingham, they are composed exclusively of political partisans. A Conservative licensed victualler would trust the magistrates more implicitly than a committee of a Radical Corporation. On the whole, it is nearly certain that the licensed victuallers will give the present Government, not only their votes but their influence with customers, whose interests in the particular case are identical with their own. Permissive agitators seem never to remember that in prohibiting the sale of liquor they would also prohibit the purchase. In his touching picture of the blessings of social life on Sunday Mr. BRIGHT omits the conditions of eating, drinking, and sitting by a comfortable fire. Whether the publicans and their clients or the Permissive party are the more numerous is doubtful; but nearly all the friends of local option would in any case vote for Liberal candidates, while the opponents of compulsory asceticism increase the normal strength of the Conservative party. It would be useless to proceed from an inquiry into some of the conditions of the contest to a conjectural anticipation of the result which will be known in a fortnight.

THE SHORT SESSION.

THE last Session, or fragment of a Session, of the Parliament elected in 1874 must be noticed now, if at all, for it is destined to be soon forgotten. Whatever may have been the reserved purpose of Lord BEACONSFIELD, the Cabinet in general must have expected that the Session would be allowed to complete its regular course. The LORD CHANCELLOR had prepared three important Bills relating to land, which he afterwards introduced; after the beginning of March Sir S. NORTHCOTE fixed a day for a Bill on the distribution of seats; and the ATTORNEY-GENERAL was undoubtedly authorized by the Government to proceed with the Criminal Code, which was to be referred to a Committee. Mr. CROSS supposed that another Committee, to which he proposed to refer the Bill for purchasing the undertakings of the London Water Companies, would have time for a long inquiry. The intentions of the Government may perhaps have been modified by the Southwark election immediately after the meeting of Parliament, and by the Liverpool election in the last days of the recess. The unfortunate result of Lord RAMSAY's advances to the Home Rule voters may have suggested the expediency of relying on the general impatience provoked by the insolent dictation

of Irish agitators. Mr. PARNELL had boasted that he could control forty seats in Great Britain; and the Conservative agents may have thought that they saw their way to a defeat of the Liberals in the same constituencies. The earliest part of the Session was almost exclusively devoted to Irish affairs, and principally to the Government Relief Bill. On the first night Mr. SHAW forced an adjournment of the debate on the Address; and a censure on the Government which he proposed in the form of an Amendment was debated during three or four sittings. Sir STAFFORD NORTHCOTE in vain suggested that the discussion of the conduct and proposals of the Government would be more conveniently taken when he introduced his Bill for Indemnity and for the extension of the powers of the Government and subordinate authorities. The Irish members were determined to have the first word, and it was impossible to prove that their speeches amounted to obstruction. On the division they were defeated by more than three to one; but the support which they received from Mr. CHAMBERLAIN, Mr. RYLANDS, and Mr. MUNDELLA seemed to indicate an actual or probable alliance between the Home Rule members and the extreme Radical section. Ingenious politicians began to conjecture that Lord BEACONSFIELD might possibly be advised to dissolve early in the Session on the pretext of Liberal connivance at obstruction.

Except from irreconcilable Irish patriots, the Relief Bill met with general approval. Lord EMLY, in a speech which proved his knowledge of the subject, objected to the powers given to Presentment Sessions to provide employment on public works; and other criticisms of the details of the Bill were considered in both Houses. On the whole, it was admitted that the Government had displayed both prudence and vigour; and the application of a small portion of the Irish Church Fund to the relief of distress was sanctioned by a large majority. Mr. MELDON's motion for the assimilation of the Irish borough franchise to that of England furnished the Liberals with a legitimate opportunity of acting in concert with Mr. SHAW and his followers. Mr. BRIGHT and Sir W. HARCOURT delivered speeches in favour of a measure which had the advantage of seeming to be equitable, and the negative merit of, at the worst, being calculated to do little harm. The representation of Ireland would be almost imperceptibly deteriorated by a change which cannot be long delayed; but the Government, as on former occasions, opposed the Bill, which was rejected on a strict party division by the normal majority of sixty. The Home Rule members had thus far been constantly pugnacious and occasionally tedious; but it could not be denied that they were fully entitled both to discuss the Relief Bill and to ask for the removal of an electoral inequality which could only be vindicated on grounds of practical expediency. A trivial question of privilege, unwisely elevated to importance by Sir STAFFORD NORTHCOTE, was welcomed by two or three Irish members as an occasion for caricaturing the proposal of the Minister. Mr. PLIMSOLL, having in a characteristic burst of excitement denounced by public placards the Parliamentary conduct of two members who were not even opponents of one of his benevolent Bills, was with difficulty induced to apologize to the House for an indefensible proceeding. Sir STAFFORD NORTHCOTE nevertheless insisted on recording a censure of the breach of privilege; and, notwithstanding an opposition which was led by Sir W. HARCOURT, he was as usual supported by his loyal majority. On a later day Mr. SULLIVAN and Mr. O'DONNELL facetiously complained of mock breaches of privilege, which Sir W. HARCOURT affected to extenuate in the same tone in which he had dealt with Sir STAFFORD NORTHCOTE's condemnation of Mr. PLIMSOLL.

On one of the last days of February the CHANCELLOR of the EXCHEQUER proposed a Standing Order for the purpose of checking wilful obstruction. At the instance of any member or of his own motion, the Speaker or Chairman of Committee was empowered, after preliminary calls to order, to name a member as transgressing the rules of debate. The House might then, on motion without debate, suspend the offender from the exercise of his Parliamentary privilege for the day, or, on repetition of the offence, for a longer time. A violent opposition to a moderate and reasonable proposal would perhaps not have been unwelcome to the Government; but Lord HARTINGTON, as might have been expected from his character, and even Mr. GLADSTONE, approved of the principle of the Standing Order, and announced that, if their objections to certain details were not accepted by the Government, they would abstain from proposing amendments. The members against whom the Standing Order was directed abstained from violent opposition. The new rule was adopted almost with unanimity; but it will be for the next Parliament to test its efficiency. The highest Parliamentary authorities are believed not to be sanguine as to the possibility of suppressing contumacious obstruction by any legislative or disciplinary measure. There is a general consent of opinion that Sir S. NORTHCOTE was well advised in proposing a mild measure; and, although the question is disputed, he seems to have been right in vesting the power of suspension rather in the House than in the presiding officer. The way seemed now clear for the useful legislation to which, as some of the Ministers had stated, the Session was to be devoted. There was no immediate danger of Parliamentary obstruction, and the passing of a few measures which would have provoked little opposition might have given the Government an additional claim to the confidence of the constituencies. On the other hand, some irritation was caused in London by the announcement of the bargain which Mr. CROSS had provisionally concluded with the Water Companies. He had conceded to them the receipt of their actual income, and of an increment which, in default of new circumstances, they will obtain in a few years; and the result of providing the same revenue with improved security had of course been to raise largely the market price of the shares. Mr. CROSS seems to have satisfied himself that a voluntary purchase could not have been effected on better terms; and he trusted to the Select Committee to give due weight to objections which might be urged on behalf of the consumers. The clamour which was excited by the publication of the scheme must have convinced him that he had made a mistake.

The transaction of business would have been facilitated by the indisposition of Parliament to revive obsolete discussions of foreign affairs, though the Duke of ARGYLL had forced the House of Lords once more to travel over the dreary record of the transactions between SHERE ALI and successive Viceroys. In the House of Commons Mr. FAWCETT confined himself to the practical proposition that the English Treasury ought to bear a part of the cost of the Afghan war. A resolution in favour of Protection, under the name of Reciprocity, unwisely proposed by Mr. WHEELHOUSE, gave Mr. BOURKE and the CHANCELLOR of the EXCHEQUER an opportunity of delivering vigorous and conclusive speeches against any relapse into worn-out economical errors. Mr. HOLMS found little support for a motion for the institution of quinquennial Parliaments. Mr. BLAKE was defeated by only a small majority in a proposal to abolish the exemption of members from arrest; but the question excited little interest. Mr. P. A. TAYLOR would have been signally defeated on a motion for the total abolition of the Game-laws, if Sir W. BARTTELOT had not rendered him the service of moving an amendment to the effect that no change was at present needed. More popular interest was excited by Sir W. LAWSON's Permissive Bill in its new disguise of Local Option. Mr. GLADSTONE, notwithstanding his language in Midlothian, declined to vote; and Lord HARTINGTON voted against Local Option. Mr. BRIGHT also repeated his former objections to the Permissive Bill; and the influence of the coming election was represented by an adverse majority increased since last year. On the 8th of March the announcement of the dissolution came like thunder in a clear sky. The causes of the decision are not to be found in the unexciting history of the short Session; but all parties were unwilling too severely to criticize a measure which they all professed to desire, if not to approve. The chief transactions of the short remainder of the Session were the unnecessary alteration of the Corrupt Practices Act and the Budget, which was unavoidably introduced at an unusually early date. The proposal that the conveyance of borough voters to the poll should be made legal might have been plausibly attributed to a generous desire of furnishing Mr. GLADSTONE, who needs no such boon, with additional materials for vituperation. The Budget, as far as it spreads the payment of the accumulated deficits over five years, was generally approved; but a considerable increase of the Probate duty under pretext of readjustment has provided Mr. GLADSTONE with matter for half-a-

dozen speeches on the preference given by the Government to landlords over tenants. The alleged injustice which he denounces is much more largely involved in the Probate duty which Mr. GLADSTONE has never altered than in the new addition; but the CHANCELLOR of the EXCHEQUER ought to have foreseen the facilities which he afforded for hostile clamour. The Parliament has expired suddenly, like a man who in extreme age dies of an accident. If the labours of its last Session had not been undertaken, the results would scarcely have been missed.

THE REPUBLIC AND THE JESUITS.

IF the question were less serious in its bearing on the tranquil working of Republican institutions in France, there would be something exceedingly comic in the invocations of the "existing laws" with which the speeches and newspapers of the Left are now laden. In the Radical vocabulary "existing" must for the future be taken as equivalent to "obsolete." The French Government cannot find any law applicable to its present wants without going back to the time of the First Republic and the reign of LOUIS XV. When a man speaks of the clothes he now has in wear he is not usually understood to mean the clothes which have come down to him from his grandfather and great-grandfather. The Republic of 1848, the Second Empire, and the present Republic for the first nine years of its life, have managed to get on very well without appealing to the laws in question; and it would be at least interesting if the Left would condescend to inform their countrymen what it is that has made perseverance in this commonplace path impracticable. Granting, for the sake of argument, that the non-recognized religious orders are as black as it pleases M. PAUL BERT to paint them, for what is it that they are now to be punished? It is not a light matter to recall to active life laws that have been forgotten for so many years. Disused statutes are like disused ordnance; they sometimes burst at the moment of discharge, and hurt no one but those who insisted on firing them. The charges brought against these orders, so far as they are not of the purely declamatory type, seem to be two—that, under their influence, the Church has ever since 1870 been an element of confusion and strife in French society, and that they were directly responsible for Marshal MACMAHON's action in 1877. Both these statements are to some extent true; but both might be very much more true than they are without in the least affording a foundation for the conclusions which the Left seek to build upon them. The conduct of the French clergy ever since the fall of the Empire has undoubtedly been extremely shortsighted. In point of fact, to compare great things with small, they have acted very much as the English licensed victuallers have acted. They have been so much afraid of what the Radicals had in store for them that they have identified themselves altogether with the Conservatives, in entire forgetfulness of the fact that some day or other the Liberal party was certain to be again in power, and that then it might be highly inconvenient to have been continually at war with it. The clergy assumed from 1871 onwards that the only hope of religion in France lay in a return to monarchical government. Instead of seeking to be on friendly terms with the Republican authorities, and frankly accepting the Republican Constitution, they intrigued against both. That they did so in part under the guidance of the Jesuits is quite possible. The Jesuits had the ear of the then POPE, and they had also the ear of the reactionary leaders in France, and as both, for different reasons, were eager for the overthrow of the Republic, such influence as they possessed was naturally thrown in this direction. In 1877 this agitation came to a head in the injudicious and hopeless enterprise of the 16th of May. That this was largely the work of ecclesiastics is likely enough. It was almost too foolish to be the work of laymen. But when all this has been admitted, how much nearer are we to the point to which the Left seek to bring us? The Jesuits have done their utmost, and the result has been their complete overthrow. The 16th of May did more to establish the Republic in France than all the efforts of the Republican party put together. It made it clear that the French people were thoroughly anti-clerical as anti-clerical was then understood—that is, that they were thoroughly determined that France should not be governed for clerical ends nor by clerical methods. Since the 13th of December, 1877, what has the Republic had to fear from the Jesuits? The Right could not even have rejected the 7th Clause in the Senate had it not been for the help of the very man whom in May 1877 they had instigated Marshal MACMAHON to dismiss from his councils. They have never so much as snatched a victory in either Chamber by their own strength. They have never exercised the slightest influence on the course of public affairs. The alliance between the Conservatives and the Jesuits may have been absolutely Satanic in its wickedness, but it has been absolutely unfruitful in its results.

Nor is it at all certain that, if the Church had played the part of peacemaker, she would have found any one to listen to her. It suits the purpose of the Left to assume that the reactionary sentiment which was dominant in the Assembly of 1871 would have been inert and harmless if the Jesuits had not been at hand to turn it to their own purposes. There is nothing in the conduct of the Right during the last few years that gives the least colour to this assumption. No doubt they were very glad to get all the help they could; and, so long as the clergy or the religious orders chose to work with them, their devotion to the Church was edifying. But the Right have invariably shown themselves possessed of a store of party passion which needed no replenishing from without. It is enough that they were Legitimists, or Orleanists, or Bonapartists, to ensure their being enemies of the Republic. If they were ardent Catholics at the same time, they had an additional reason for hating it; but as they hated it with all their strength before, not much came of the addition. It is a characteristic of French parties to detest one another with a constancy and a violence to which there is no parallel in England; and if the Catholic Church had taken an opposite course, it is far more probable that the Right would have become lukewarm Catholics than that they would have become even acquiescent Republicans. Inexplicable as it may appear to a French Radical, there are a considerable number of his countrymen to whom his doctrines and his person are alike distasteful. If the clergy, whether secular or regular, had set themselves to root out this reprehensible feeling, as undoubtedly they ought to have done, the Right would suddenly have become convinced of the paramount necessity of checking ecclesiastical usurpation. The Eldest Son of the Church was never disposed to let his mother have any will of her own, and the parties among whom French royalty is now held in commission are quite capable of emulating his indifference to spiritual claims if it suited their purpose to do so. If there is any genuine alarm underneath the Radical attack upon the religious orders, it is one which has altogether mistaken the quarter from which danger to the Republic is really to be apprehended. By doing all they can to make a lasting peace between the Church and the Republic impossible, the Left are enlisting on the side of reaction numbers of Frenchmen who would not otherwise have been drawn in that direction. The Church is the one institution which now links the France of the present to the France of the past. Everything else is changed in form, if not in substance; the Church alone has survived the revolution, and is in essentials a copy, if a pale copy, of what she was under the old order of things. As she has at the same time parted with all that associated her with the abuses of that old order, and is now poor enough to excite neither envy nor irritation. there is nothing to prevent the good will which naturally grows up towards such an institution in a nation in which the conservative instinct is extremely strong from having its free course. Why the Radicals should have laboured so hard to make it needlessly difficult for any one entertaining this good will to call himself a Republican would be unintelligible if we accepted their own account of the matter as the true one. To suppose that they attack the Church because they fear her is to suppose them ignorant of the very obvious fact that, if the Republicans had chosen to bid against the Right for ecclesiastical favour, there is very good ground for supposing that their offers would not have gone unregarded. To suppose that they attack the Church because they hate her, is to suppose that, like many other people, the pleasure of gratifying a traditional and accumulated spite—a spite, it must be admitted, which is not entirely without cause—blinds them to the plain dictates of prudence. Their demeanour is that of a man who feels that, if he could but

once get his foot on the neck of his adversary, he would not care much how long he might be able to keep it there, or what might happen to him when it was withdrawn.

THE CLEWER COLLAPSE.

IT is impossible at the first moment adequately to estimate the severity of the blow which the Church Association has by its own vindictive obstinacy brought upon itself in its contest with the Bishop of OXFORD and Canon CARTER. If the new Solemn League and Covenant had only been litigious and persecuting after the manner of men, it would have sat down and striven to make the best of its defeat last year in the Court of Appeal. Dr. JULIUS was confessedly the puppet of an organized conspiracy in London to which Clewer was only a name and a battle-field, and even conspirators might be satisfied when a unanimous Court, in the persons of Lords Justices BRAMWELL, BAGGALLAY, and THESIGER, confirmed the appeal which had come before it from the narrow and crotchety decision of the Queen's Bench, under which Bishops found themselves reduced to the humiliating condition of mere officers of the Court for the furtherance of vexatious persecutions. But the promoters of the suit had gone too far for retreat, when, in furtherance of their avowed intention of crushing their aged and honoured victim, they passed over the Public Worship Act of 1874 in favour of what they hoped and believed to be the more merciless Church Discipline Act of 1840; so, in the spirit of the infatuated EMPEROR, when he telegraphed back to Paris "Tout peut se "rétablir," they elected to make a dash into their Sedan, that House of Lords from which there is no appeal. The blow which the Church Association has thus brought upon itself is not to be measured by the many thousand pounds which it will wring from its sanguine and sanguinary votaries, nor by the disappointment which it will feel in losing what seemed to be so sure a chance of persecuting men so well hated as the Bishop of OXFORD and Canon CARTER. The rejection of its appeal is a rout, and not a defeat, as the condemnation of its policy, pronounced by the mouth of the law, will be endorsed by common sense and the general moral sentiment of the country. If anything were wanting to complete the catastrophe, it would be found in the antecedents and plainly expressed personal opinions upon ritual and ecclesiastical matters of the four eminent jurists who composed the Court; for even the Church Association will hardly insinuate that the English Church Union can have beguiled or terrorized Lord CAIRNS, Lord PENZANCE, Lord SELBORNE, and Lord BLACKBURN.

The legal question at stake was of a somewhat technical and restricted character, being the contention as to whether the expression "it shall be lawful"—occurring in the Church Discipline Act of 1840, as in so many other Acts of Parliament—ought, as common sense and grammar would dictate, to be taken as permissive or as imperative and obligatory. The drift of the contention in the present case was the presence or absence of discretion on the part of a Bishop to decline to entertain any complaint about anything brought by anybody against any clergyman. The Queen's Bench, for reasons ingeniously expounded by the CHIEF JUSTICE, decided that the words were obligatory and imposed a duty, while this decision has been unanimously overthrown both by the intermediate and by the ultimate Court of Appeal. Sir ALEXANDER COCKBURN, taking a technical view of the authorities which came under his notice, and not helped by the Bishop of OXFORD's counsel, who was none other than the BISHOP himself, decided that, for good or ill, these words must be generally held to be obligatory, and that the onus in each case of proving them to be permissive rested on those whose interest lay that way. He found no such proof in the Church Discipline Act, and so, groaning much over the confusion which he saw must result from his view ultimately prevailing, he had no option but to compel the prelate to obey the behests of the Association. The higher Courts, taking a wider and a simpler view of words which Lord CAIRNS calls "plain and unambiguous," and "merely "making that legal and possible which there would other-"wise be no right or authority to do," have reversed the presumption. The words—so it is now decided—are generally permissive; though there is a large and clearly definable class of cases in which they become obligatory, not *proprio vigore*, but in virtue of another principle as plain and unambiguous as the first one. The cases which misled the CHIEF JUSTICE can all be referred to this principle, which is tersely summed up by Lord PENZANCE as follows:—"The "conclusion arrived at by the Courts in these cases was "this—that, regard being had to the subject matter, to "the position and character of the person empowered, to "the general objects of the statutes, and, above all, to the "position and rights of the person or class of persons for "whose benefit the power was conferred, the exercise of "any discretion by the person empowered could not have "been intended."

The question which the House of Lords had to consider was whether the case now before them fell under this exception; and the reasons which led the Judges unanimously to resolve that it did not so fall give us the clue to the policy and intentions of the Church Association. In other words, the evils which, as the Law Lords declare, would flow from reading the Church Discipline Act in the way which the Church Association has tried to force upon the Bishops and Judges, are the very objects for which that pestilent confederation exists and energizes. In defining them we shall avail ourselves of Lord CAIRNS's language. The Association claims that "any one who never entered the "parish; who never had been in England; who was igno-"rant perhaps of the language; who was not a member of "the Church of England; who was not possibly a believer "in Christianity; or who was a pauper or wholly un-"able to answer the costs of the suit," may force the Bishop to proceed, though "the offence charged may be "an offence against the laws ecclesiastical, but it may be "of so trifling and insignificant a nature, that no one "having any discretion in the matter ought to allow it to "be the subject of litigation." Such is the demand of the Association, while upon its policy Lord SELBORNE dryly observes:—"It is, at least, not obvious that it would "be for the interest either of the Church or of the State "to open or leave open so very wide a door to private in-"tolerance, contentiousness, uncharitableness, or folly."

Here we have the Church Association painted by artists whom no one will accuse of being actuated by any malicious prepossessions against it, and the common sense of moderate, peaceable Church people will welcome with thankfulness the revelation and the discomfiture of its catspaw the too-daring parishioner of Clewer. As at the downfall of his more eminent namesake,

> Ere the mightiest Julius fell,
> The ghosts did squeak and gibber in the Roman streets—

so there will be much squeaking and gibbering, we make no doubt, and perhaps even more naughty sounds in the Committee Room of the Church Association. But the tide is on the turn, and the general community will, we are sure, recognize that the Church of England must tolerate great variety within the limits of the Prayer-Book; and that, wherever there is real zeal and an earnest purpose, it must not be too severe even upon occasional excess or defect, unless it desires to give comfort to that agitation of the enemies of the Church of England, the inferential encouragement of which by Mr. HERBERT GLADSTONE has been astonishing the electors of Middlesex, when the young candidate informed them that "he would desire to "maintain the historical connexion of the Church with "the State; but if public opinion declared itself de-"cisively against the connexion, he would not stand in "the way of the wishes of the majority of the people."

INDIAN FINANCE AND PUBLIC WORKS.

INDIA still continues to supply the opponents of the Government with a congenial topic for dispraise. Undeterred by arithmetical demonstration to the contrary, Mr. GLADSTONE maintains his accusation against the rulers of that country, as having "augmented her taxation and "contracted her liberties"; while Lord GRANVILLE denounces them as destroying the liberties of the press and "so extravagant as to be obliged to stop all public works." Language of this nature is understood perhaps by speaker and hearers alike as not intended *au sérieux*, or as anything but the licensed inaccuracy of electioneering rhetoric. Probably not one in a thousand of Lord GRANVILLE's or Mr. GLADSTONE's hearers has any sort of knowledge of

Indian finance or the slightest interest in or connexion with Indian administration; and if the convictions of such people as to the necessity of a change of Ministry can be strengthened by a hasy impression that India is being shamefully misgoverned, political excitement is not likely to be very scrupulous as to the means by which that impression is produced. Not the less is it a grave misfortune that the English people should be taught to consider Indian politics as within the sphere of their interests and at the same time to be content with sensational, inaccurate, and misleading treatment of the great administrative questions involved. English public opinion does, as the events of the last two years have shown, exercise a perceptible influence on the course of the Indian Government, and that influence may easily become extremely pernicious. It becomes daily more important that Englishmen should take the trouble to learn the facts about the great dependency with which they have come into such intimate connexion; and speeches such as those which the VICEROY and Sir JOHN STRACHEY recently delivered on the introduction of the Budget are sufficient to give any one who will read them with attention such an insight into the position of the country as will be a guarantee, at any rate, against the commoner and grosser delusions which prevail regarding it.

The topics with which English public opinion has of late been principally concerned are the alleged insolvency of India, the alleged increase of taxation, the alleged misappropriation of funds collected for the relief of famine to war and other matters, the alleged wastefulness of the expenditure on public works, and, finally, the alleged mismanagement of the Customs revenue, especially the remission of a part of the cotton duties in deference to the interests of the Manchester manufacturers. As to each of these the figures of Sir JOHN STRACHEY's balance-sheet are curiously instructive. With regard to the first, it is now clear beyond the possibility of dispute that the view, taken by Mr. FAWCETT and others, of the Indian Exchequer, as sinking year by year into more hopeless embarrassment, is wholly without foundation. The country has just passed through a period into which every possible cause of financial embarrassment would appear to have been crowded. There has been a famine, the most intense and wide-spread on record, which has at once involved the Government in enormous expenditure and crippled the resources from which such expenditure must be met. There have been losses, wholly unprecedented, owing to the depreciation of silver and the course of exchange; there has been war, not on a great scale, but still costly and difficult; there has been paralysis of trade, partly owing to the famine, partly in sympathy with the depression in Europe and America. Through this severe ordeal the country has passed without any permanent injury. It has rallied with extraordinary speed from the effects of the famine. The results of the last two years and the estimates for the coming year point to a condition of financial soundness to which most European Exchequers might look with despairing envy. During these three years it is estimated that 5½ millions will have been spent in war, 3½ millions in the construction of strategical railways on the frontier, 400,000*l.* will have been devoted to famine relief, 10 millions will have been lost by the unfavourable exchange, 900,000*l.* will have been given up in remission of taxation, and yet the period will end with a surplus of 3½ millions.

The same result is shown in perhaps a still more conclusive way by a review of the finance of the past decade. During this period the expenditure of India—war, famine, public works, and every other kind of outlay included—exceeded its income by 36¾ millions; but the whole of this excess, with the exception of a million, was invested in productive works, whose productiveness is now satisfactorily attested by the fact that in the coming year the railways and canals will, notwithstanding the incomplete or undeveloped condition of several of them, earn enough to cover their working expenses and interest on their capital. During this period 9¼ millions will have been spent in war and frontier railways, and 14½ millions in famine relief, the whole of which, with the exception of a million, will have been defrayed from current income; an achievement which certainly appears to us to place the Indian Exchequer in an almost unrivalled position as regards the capacity to meet extraordinary expenditure.

The next charge of which the financial statement disposes is that of increased taxation. Mr. FORSTER and Mr. GLADSTONE, misled by accounts which they had not taken the trouble to examine, put forward some months ago definite allegations on this head, and though explanations were immediately forthcoming it is satisfactory now to know from the highest authority the precise facts of the case. Of the apparent increase on which Mr. FORSTER dilated, part is owing to additions of territory—five great provinces, with an area double that of the German Empire; part, 8½ millions, to changes in the form of the accounts, which show gross items on both sides of the balance-sheet instead of net results on one side only; part to the increased area of cultivation, the enhanced value of agricultural produce, and the extension of canal irrigation; none, it is satisfactory to know, to a heavier load of taxation imposed on the individual taxpayer. During the three years with which the financial statement deals, remissions of taxation amounting to 900,000*l.* have taken place, and neither the land revenue nor other imposts have at any previous time fallen with a lighter incidence on the general population. It is true that, with the view of equalizing the salt duties, the price of salt was raised last year in the South of India and lowered in the North, the change being adverse to 47 millions of people and favourable to 130 millions; but even in those parts of the country where the price has been raised the consumption is greater than it was three years ago, while with vast multitudes in Upper and Central India the cheapened price of this invaluable necessity has resulted in an increase of consumption so considerable as fully to compensate the Government for the original sacrifice of revenue. The great Customs line which stretched right across India, and was a constant source of oppression, has been abolished, the 100,000*l.* involved in its maintenance has been saved, vastly greater quantities of salt have been consumed, and the receipts of Government have steadily increased. No financial reform was ever carried through with more absolute success.

The charge of wasteful expenditure on public works had been already to a great extent disproved by the finding of the Parliamentary Committee last summer, and is now disposed of by the fact that the balance-sheet of the coming year is expected to show profits more than equivalent to their expenses and interest. The true position of this grand undertaking is insufficiently understood. In 1873 the Government embarked on what was probably the greatest speculation in the world. It determined to make a system of canals and railways all over the country, and in so doing to invest from three to five millions of borrowed capital per annum for a series of years. This programme has been carried out with an exactitude and success creditable alike to the authors of the scheme and those to whom its execution has been entrusted. The expenditure has been less, the profits have been larger and more quickly earned, than it was safe to hope. The curtailment of this scheme and the restriction of the outlay to 2½ millions per annum—conceded last year to English agitation—are measures which every Indian administrator deplored at the time, and in which, in the present condition of the finances of the country, the Government can hardly be expected to persevere. Sir J. STRACHEY speaks with emphatic regret of the results of this unfortunate change of plan. It must, he says, seriously postpone the day when the country will be protected against famine by its railways and canals. The LIEUTENANT-GOVERNOR of BENGAL has an overflowing exchequer and an admirable scheme of works, which, "without costing the Imperial "revenues a shilling, would have added several millions "to the wealth of his great province"; but all is at a standstill. The LIEUTENANT-GOVERNOR of the NORTH-WEST PROVINCES has a similar scheme of light railways, which, in conjunction with the canals, would have gone far to render famine in that part of India impossible; but he, too, is unable to proceed, owing to the restrictive policy proscribed last year. This state of things is not of course likely to be endured for long; but meanwhile the loss to the country is great, and it remains a matter of regret that a scheme so fraught with blessings to mankind, and which had hitherto more than realized the hopes of its founders, should not have been carried out in its integrity.

Of the "Famine Insurance Fund" Sir JOHN STRACHEY gives an account which not the dullest of his opponents will, we think, be able to misunderstand. The Government having made up its mind for a liability on account of famine expenditure of 15 millions in ten years, it became necessary to provide a margin of ordinary

income over ordinary expenditure of 1½ millions per annum. A further margin of half a million was to be provided against unforeseen contingencies. Abnormal expenditure on war, famine relief, and Public Works undertaken either as "productive" or as "protective against "famine," was excluded from the calculation. This programme has been faithfully carried out. "If the accounts "and estimates of the three years," Sir J. Strachey says, "are subjected to the most severe criticism, it will be "found that the estimated and actual surplus of revenue "during this period does truly far exceed the 6,000,000l. "which, according to the standard which we have pre-"sented to ourselves, should be attained in three years, "if the solvency of the State is to be assured."

As regards the remission of the cotton duties, the results have fully justified the convictions of those who in England and India have advocated a policy of free trade. Vast quantities of the non-dutiable qualities of goods have poured into the country, trade has received a perceptible stimulus, and Sir J. STRACHEY may already congratulate himself on the approach of the day when the continuance of the now surviving duties will become obviously indefensible. The abolition of all restrictions on Indian trade has for years been his darling project, and already he ventures to predict "that the time is not "hopelessly distant when the ports of India will be "thrown open freely to the commerce of the world."

Such, as it appears to us, are the results which the last Indian Budget establishes—results to which the VICEROY and his Minister may justifiably point as the best refutation of the libels which ignorance or partisanship has for months past been hurling at the Indian Administration. It is too much, of course, to hope that English statesmen, in the passionate excitement of a great political duel, should find leisure or inclination to call in question the accuracy of their facts or the justice of their accusations. But to the mass of educated Englishmen, who love fair play and regard the fortunes of India as something more than a rhetorical convenience, such a statement as that of the Indian Finance Minister will carry a profound conviction that one portion at least of England's great task of Empire is being performed in a manner of which England will have no reason to be ashamed.

ONE-SIDED FREE TRADE.

IT was not to be expected that the late Parliament would come to an end without the plaintive notes of the preachers of Reciprocity being again heard. Mr. WHEELHOUSE's ill success was a sufficient reason why their last lamentations should not be upraised in the Commons. On the whole, the House of Lords forms a better field for this kind of exercise. Reciprocity is not a subject upon which a speaker likes to be too sharply brought to book, and in the calm atmosphere of the House of Lords he may look pretty confidently to escape this. If reciprocity were a Liberal craze, Lord BEACONSFIELD would be a formidable critic; but as it is exclusively a Conservative delusion, the PRIME MINISTER is bound to treat it tenderly. Consequently the Duke of RUTLAND did not risk much when he rose on Monday to call attention to the disastrous results of one-sided free trade. He was sure of an answer, because Lord BEACONSFIELD would not choose it to be said that the Government had remained silent when one of their own party was calling for a return to protective duties; and he was sure of a courteous answer, because on the eve of an election Lord BEACONSFIELD would not wish to make a single supporter less anxious by ever so little for the success of the Government. In consequence, perhaps, of this sense of security the Duke of RUTLAND was not quite so cautious in his handling of his subject as the members of the House of Commons who share his views. The success of reciprocity is to be obtained, he frankly admitted, by the imposition of retaliatory duties. England is to coerce France and America into abolishing Protection by setting up protection anew within her own borders. It must be supposed that the Duke of RUTLAND is so much in love with the idea of retaliation that he does not care whether the application of it has any effect or not. The French people are slowly and painfully groping their way towards free trade, and if there is anything that could make them retrace the steps they have taken, it would be the news that England had at length been disabused of the fallacy which she had done so much to impose upon the world. If England were to give up free trade, the hopes of the protectionists would rise in every country of the world. Instead of accepting the change as a warning to reconsider their ways, they would read in it an intimation that their ways were once more becoming the ways of reasonable men in all countries. So long as England adheres to free trade, even when the immediate results of it are inconvenient to her, foreign protectionists, are, at all events, forced to explain the fact. If England were to abandon free trade, they would say with apparent reason that the motives which had led us to adopt it in the first instance were not only strictly selfish, but strictly temporary as well.

There is another argument, however, which might have been expected to commend itself to the Duke of RUTLAND with a great deal more force than this one. After all, he would probably care very little whether the retaliatory duties he wishes to see imposed failed of their effect or not. If reciprocity proved unattainable by these means, England and her neighbours must be content to tax each other's goods as long as the world lasts. But the proposer of retaliatory duties is bound to take into account the possibility that the imposition of them may have the intended effect; and it is plain that if, under the pressure of duties reimposed upon French goods entering England, France were to take off the duties she now levies on English goods entering France, large bodies of English workmen would be very cruelly treated. There can be no use in imposing protective duties in favour of any English industry if it is strong enough to flourish without them. English goods sold in England have the advantage of cheaper carriage; and if under a system of free trade other countries are able to produce them more cheaply, it is clear that they must enjoy superior natural advantages for their production. Consequently the industries engaged in producing them can never flourish except under a system of protection. They may be recalled to life by the imposition of retaliatory duties, but as soon as those retaliatory duties are taken off they will once more begin to languish. What the Duke of RUTLAND asks the Government to do, therefore, comes to this. Certain large trades have been ruined by French competition. The ruin of a trade means that capital is at all events on the high road to be withdrawn from it, and that the workmen employed in it have begun to migrate to other industries. In other words, the worst is already over. The sufferers by foreign competition have recognized the hard facts of the situation and have begun to make provision against them. How does the Duke of RUTLAND propose to treat these unfortunate people? He calmly advises that they should be encouraged once more to invest their capital and industry in a trade which can only flourish under protective duties, while at the same time he avows that as soon as these protective duties have answered their purpose they are to be taken off. This is the only meaning that his proposal can possibly bear. Something must be done, the DUKE says, to force other countries to reduce their duties, and this something is to be the imposition of a retaliatory duty. Necessarily, therefore, this retaliatory duty must be taken off as soon as the duties against which it is aimed have been taken off; otherwise they would be put on again immediately, and the whole object of imposing the retaliatory duty would be lost. The Duke of RUTLAND is so much impressed with the hard case of the sugar-refiners, who are suffering from the French bounties, that he wishes to restore them to prosperity by immolating the silk-weavers, or whatever other class of workers he may select for an experiment in the direction of retaliation.

Lord HARTINGTON has lately been much exercised to discover Mr. ECROYD's views about reciprocity. We do not know that he will be much the wiser after reading the Duke of RUTLAND's exposition of them. Mr. ECROYD wishes, it seems, to see England and her colonies formed into a vast Zollverein, in which England shall undertake to supply her wants from colonial produce rather than from the produce of any foreign nation which imposes duties on English goods, while the colonies shall undertake to admit all our goods without duty. If this be really Mr. ECROYD's view, he seems to have studied colonial practice to wonderfully little profit. Protection is at least as popular in the colonies as it is in the United States or in France; and, unfortunately, the country against which protective duties are most frequently and constantly

imposed in Great Britain. The trades which the colonists wish to see established within their own boundaries are usually those in which the mother-country is their most dangerous rival. They want to secure variety of employment, and for this purpose they are bent upon protecting a number of young and tender industries in the hope that they will one day be able to subsist alone. The establishment of free trade with England would be false to this design, and we fail entirely to see how Mr. Ecroyd and the Duke of Rutland propose to get over this difficulty. Where business is concerned the colonies are remarkably free from any sentimental weakness towards England. If it can be proved to them that they will benefit by the Zollverein, they would no doubt be willing enough to enter into it; but as the thing they are most afraid of is the competition of English producers, it is not easy to see how the proof is to be made out to their satisfaction.

CONTRASTS.

AMONGST the enliveners of commonplace existence—the life of commonplace minds in commonplace circumstances—perhaps no intellectual stimulant is equal to strong contrasts, whether in the world of fact or of fiction, whether viewed as a personal matter or regarded as a spectacle. There is something in a marked contrast which shakes the stagnant faculties, makes thinking easy, and puts even the dullest intelligence on its mettle. From the mere act of contemplating it the man derives a sense of elevation, as feeling that, without his reflections and judgment upon it, the phenomenon would fail of its purpose. And, as offering themselves unsought, there is something in strong contrasts peculiarly grateful and pleasing to ordinary listless observers—to idle readers and lazy thinkers. And of course not only to them. Every one is struck by a striking contrast; touched by a tender, impressed by an awful, amused by a grotesque, surprised by a startling, hit by a neat, pleased by a fanciful, amazed by a hyperbolical, contrast. But this is specially the field of minds too slow to catch passing impressions or too mercurial to retain them. It needs little thought or trouble, makes small demand on taste, discrimination, attention, or knowledge, to take in the bearings of a bold effective contrast. People are here all on a par. Language readily suggests itself in such cases to the least eloquent or exact of speech. Take, for example, the ruin of to-day contrasted with the careless prosperity of yesterday. There is always something to be said to the point; anybody can be sententious on sudden changes in circumstances, fortunes, events; or even on broad distinctions in moral character. Who can say how much the present general interest in politics and cognate matters is not quickened by the marked contrast of character between the two great leaders of opposing parties? Thus all persons who aim at exciting the interest and gaining the ear of numbers deal in the widest contrasts that their subject leaves room for. People who do not know that they are inventing are constantly dragged into hyperbole by the necessity of indulging this natural craving—of presenting a subject in the only light that will reach the sympathy of the mass, exciting that tingle of pleasing astonishment which a telling contrast serves to produce. It is a commonplace to say that partisans generally—agitators, alarmists, pleaders, even professional philanthropists—deal in exaggerated contrasts, setting poverty in its ideal destitution by the side of wealth, oppression of one class against tyranny and license in another, making what is temporary and accidental the rule, and a casual extreme contrast the normal state of things. There is a feeling indeed that, as a whole, men need this stimulus; that the simplicity of fact will not rouse them to their duty. The modesty of literal truth does certainly require nicer wording to set it off than the advocate has often at his command, or than his hearer has patience or justice to appreciate. There must be picturesque heightening of differences to raise such an image as will catch the interest and excite a sympathetic unanimity. Our noblest feelings owe something to this artificial heightening; as, for instance, patriotism. The likeness between man and man is certainly greater than the difference and contrast. It can never be obliterated. Men have more in common in their nature than what is distinctive; yet it is on the violent contrasts between nations and nations that it is the business of the political advocate to enlarge. The likeness is ignored, forgotten, under the figment of being taken for granted. According to race, or even geographical distinction, men are angels or fiends. Though only a silver streak divides them, yet

> Well doth the Spanish hind the difference know
> 'Twixt him and Lusian slave, the lowest of the low.

It is of no use to complain that men are thus influenced; people must receive truth according to their capacity. It is only in utopias that contrasts are minimized. We cannot do without them as objects for the fancy to rest and work upon. Men would not be more philosophical or truth-loving simply by the absence of this quickening power, by the quenching of imagination and emotion.

But it is in a more domestic field that this turn for contrasts shows itself in the most marked manner. All persons who talk much of themselves are driven as it were into drawing them. It may be done in the simplest manner, and from the most blameless motives. Every career presents striking contrasts with other careers—contrasts especially telling on the person most interested, contrasts in the course and tenor of life, in domestic trials, in literary achievement, and generally in success and failure; and they are sure to excite interest. It is a line of thought, however, presenting peculiar temptations to our natural frailty. Vanity on the one hand is apt to draw favourable contrasts flattering to self-love; envy is ever making grudging comparisons, and growing and gathering bitterness under the indulged habit. With the fortunate man, it is his luck, if it is nothing else, that establishes a standing contrast. The man with a grievance fixes his standpoint on contrasts between his own deserts and others, and between the world's estimate of them and his own. We may say that the talk of the garrulous poor is made up of contrasts. The solitary inmate of many a humble cottage feeds her self-respect on them, contrasting herself with her neighbours, to her own overpowering advantage, her strength of principle with their weakness, her strictness with their license, her plainness with their finery, her home-bound existence with their gadding, not failing to contrast the liberal benevolences bestowed on the undeserving with the scanty recognition of her own merits.

With this taste and propensity so active in human nature, it is natural that violent contrasts should be the food and material of romance; they are indeed essential to the popular novel. A novel in which the characters are carefully drawn, in which they act upon one another as they might do in familiar social life, is felt to be tame—the stimulus is wanting. The more contrasts we get between appearances and realities, prosperity and adversity, virtues and vices, happiness and misery, wealth and poverty, joy and despair, between yesterday and to-day, the more the tale answers to a demand; for whereas the happiness of real life consists in the fewness and moderation of these contrasts, the harmony of circumstances, the fitness of the man for his work and place, the gentle sequence of events, the novel pleases by showing life in a directly opposite aspect; by crowding it with startling transitions, setting every condition cheek by jowl with its opposite, vulgarity with high place, virtuous seeming with inward depravity; by caricaturing the instability of earthly things, reducing the most assured position to a mere house of cards; by the constant contrast between what seems and what is. Of course contrasts, as stock in trade, cost the inferior artist very little. He regards them as self-acting; they are to impress by their own force and weight; but they are not the less a supreme test of power. The writer who can apprehend and portray all the features of a strong contrast of passion and feeling is master of his craft. What a grasp of the position, for instance, is shown in the passage in *Jane Eyre* when what was to have been the heroine's wedding-day is turned to desolation, and she describes the contrast of feeling—"A Christmas frost had come at Midsummer."

Whatever shows, with the proper touch, the strongest contrast between the life pictured by imagination and the life men are most familiar with must always please. Thus pastorals in a splendid and highly artificial state of society, and fairies and genii in homely or simple ones, took the fancy of their day by storm. Burlesque and parody we need only mention, as both depend for success on violent contrast set out in the caricature of resemblance or even identity. But gentle and refined humour also, the humour of the choicest spirits, often shines through this medium. All illustration is likeness in contrast—that is, what furnishes the illustration must have essential and fundamental differences before the imagination can apply it to its purposes; but the object of the illustration generally is to fix minds on the likeness, while only passively apprehending the difference. There is, however, another style of illustration which directs the mind, not to the likeness, but to the contrast, as when Charles Lamb, whose love for cities and streets is well known, was shown a picturesque country lane, he exclaimed, "It is nothing compared to Wardour Street." Imagination plays on the same line when Addison proposes as one of the innumerable subjects for possible essays "Cæsar's behaviour and my own under parallel circumstances"; or Swift's appeal to the general experience—"If a man will observe as he walks the streets, I believe he will find the merriest countenances in mourning coaches"; or Sainte-Beuve persisting in fighting a duel under his umbrella—"Je veux bien être tué, mais mouillé non"; or Dryden describing the Dutch sailors before an action:—

> Vast bulks which little souls but ill supply.

And Pascal shows the same vein, reversing the fable of the mountain and the mouse, when, remarking on the contrast between great events and their causes, he wrote "Si le nez de Cléopâtre eut été plus court toute la face de la terre auroit changé."

The whole system of conceits was based on this idea of the sympathy of the human mind with broad contrasts. The poet expresses his fantastic affectation of passion through the medium of his lady's girdle:—

> Give me what this riband bound,
> Take all the rest, the world goes round.

The didactic author, using contrast as the sugared brim of the cup, hoped through its means to cheat readers into imbibing his wholesome bitters, and entitled his book "Antithesis or contrariety between the Wicked and the Godly, set forth in form of a pair of gloves for every man to wear." Such conceits have had their day, but they were an appeal to a universal

and lasting taste which all minds share, and with which every intellect can play; as, for example, the Irish butler who denied his master to callers on the ground that he was out in the back-yard shooting rats with cannon for his *diversion*.

In all moving incidents the presence of contrast is essential to give full effect to the tragic and intenser points of the scene. This has been noted as Shakspeare's rule, so to call it. Thus the murder in *Macbeth* is ushered in by serene reflections on the habits of swallows. And in history it is the same. Its more tragic stories take hold on the memory in proportion to the incongruities that surround them, tincturing terror with the grotesque, and stimulating the brain by the contrast of the homely and familiar with the abnormal. Take the accounts given by contemporaries of the assassination of the Duke of Berri, so strangely crowded by these contrasts. Wherever the news spread it was met by some startling incongruity, finding its way into a ballroom on the last night of the carnival, and scattering paleness and confusion among the revellers, all possessed by an odd spirit of travesty and burlesque, and habited in the most absurd disguises. The unfortunate victim was meanwhile carried from the door of the Opera House, where he was struck, to a sordid room in the *entresol* of the building, and laid on a truckle-bed that was with difficulty found for him; and there, in the midst of the hurry, dismay, suspense, despair of the occasion, and the anguish of a ghastly wound, disturbed by bursts of applause and gay music from the ballet still going on—for the news had not reached the stage; a ballet-girl, enlisted in the confusion as an attendant, ministering in the dress of her part, which there was no time to change. But this is carrying our subject into a more serious train than we intended.

Taking a general view of the question, we may observe that all self-reliant schemes for the amelioration of men agree in doing away with contrasts in their condition, and placing life on one level of thought, work, station, and aim. The authors of such schemes have a good deal to say for themselves; but men would be duller creatures than they are now if they had their way, and, if duller, then not happier nor better.

AGNOSTICISM AND WOMEN.

IT is a real relief to turn from the startling and not always savoury lucubrations of our strong-minded sisters, whose first aim appears to be to obliterate all distinction between the sexes, or rather to show that the distinction is an exploded fallacy, to an essay, by no means deficient in intellectual force, by a lady who is not ashamed to write like a woman, and even—which some of her more ambitious rivals may think a yet graver offence—like a Christian. Not that the thoughtful paper on "Agnosticism and Women," contributed by Mrs. Lathbury to the new number of the *Nineteenth Century*, is chiefly remarkable for being neither unfeminine nor irreligious. We should be inclined to say that its most prominent characteristic, which is not always equally apparent in the noisy advocates of woman's rights, is its strong common sense. The writer has evidently thought out her principles, and holds them with a steady grasp, but here she is content to appeal to facts. That Christianity presents to serious minds a far nobler, and therefore more satisfying, view of human life than Agnosticism does not prove its truth. We cannot adopt the reasoning of the excellent housekeeper who was shocked at the conversion of a young lady of the family to Popery, and confidentially assured her sympathizing fellow-servants amid her sobs that for her part she could never abandon her faith in Protestantism and hot suppers. But still, although "the happiness or unhappiness of a religion does not constitute its truth," it is permissible to remind those who are tempted to become Agnostics, often quite as much from fancy or fashion or intellectual vanity as from earnest conviction, that they must lay their account for sacrificing much which they can hardly regard as otherwise than valuable. It is not the writer's fault that her argument proves, not indeed too much for its validity, but more than is comprised within the immediate scope of the article. The considerations urged do not affect women exclusively, and they suggest more than is actually expressed. But the line of reasoning does apply primarily to women, and with such obvious force that many men who have lost all religious belief had far rather leave to their wives and sisters the "early heaven and happy views" which for themselves have faded into unreality, on a somewhat analogous principle to that of the famous infidel writer who insisted on his servants going to church, as the best security for his silver spoons. "Men prefer to hope that women will be slow to drive logic to its ultimate end; that they will still cling with womanly inconsistency to all that is refining and soothing in the old creeds; and that the newer and colder lights of their husbands and brothers will only serve to eliminate from those creeds the elements of superstition and fear which are now considered so debasing." The hope is of course a chimerical one. Women, emotional in temperament and timid in intellect, will not long hold out against the avowed convictions of the men they reverence and love. And thus it becomes a very practical question how the spread of Agnosticism among them will affect the interests and employments of all but the comparatively few who take an active share of some kind in professional or public work, especially as life advances and the buoyancy of youth is past. At present these interests have been mainly three:—

> It is not the lot of all to be either wives or mothers, and anyhow there are a very large number of women who find themselves, as life goes on, with no children of their own to educate, and no husband in whose pursuits they can forget themselves. To what interests and employments has this large part of the community hitherto looked forward? What has lain between the eager life of youth and the ideal rest of old age? Speaking broadly, their interests have mainly been three: Taking care of the old or sick, teaching the ignorant, and watching—not to speak of praying—with a cheerful countenance for the wellbeing of those they love. How will Agnosticism affect these three interests in the future?

After some general and very pertinent remarks on the characteristic differences between men and women, showing especially how the work of the heart rather than of the head is the sphere of woman's peculiar excellences, Mrs. Lathbury proceeds to examine in detail the probable bearing of Agnosticism on each of the three main interests already specified. The duty of tending the sick and aged must obviously lose much of its grace and significance, and nearly all the sustaining power of hope, if all is to end with death, and the unlovely process of decay, mental and bodily, is lightened by no promise of a second spring. This view of the matter does indeed, as the writer points out, give a terrible edge to the Agnostic argument for "euthanasia," on which we have before now taken occasion to comment. "By what arguments will it be brought home to the Agnostic ratepayer that it is his duty to support the hopeless lunatic or incurable pauper," or, we may add, not to abuse the latter as the *corpus vile* for some interesting scientific experiment? But to dwell on this aspect of the question would be to digress into a wider field. It will be better to follow Mrs. Lathbury into her felicitous treatment of the second main interest of woman's life—teaching the ignorant—where the argument is not at first sight so obvious. There are none who profess a livelier enthusiasm for the spread of education or a fiercer contempt for all restrictions on the diffusion of knowledge than Agnostics. But when all their fine phrases are reduced to the simple test of fact, what does it come to? What is one of the most direct and inevitable results of increased knowledge on those whose lot in life is a hard and suffering one? The Germans have a saying, *Man fühlt sich*, meaning that men, as they grow up, become conscious of the rights and dignity of manhood; they realize their position in the world. But this realizing process has other aspects also, not so flattering to pride or self-love. As the writer says, "to *know* that you are unhappy is to feel it," and, if this world ends all, is it not a somewhat questionable gain to the poor to know and realize fully that their lot is pain and discomfort here, and that there is no hereafter? Will it not suggest questionings about equality and justice neither pleasant to themselves nor of happy augury for the public weal? Will they not have exchanged the comparative bliss of ignorant content for a knowledge of higher possibilities with no practical hope of attainment? There are those, not otherwise unhappily circumstanced, to whom it is little short of an intolerable trial to feel conscious of energies and capabilities for which their position in life—perhaps through some apparently capricious accident, or some early false step of their own—does not seem likely ever to give adequate scope; and, if they are religious persons, their only consolation lies in the hope that—in the words of a Christian poet—"God hath some grand employment for His son" in a future state of being. Of that hope Agnosticism would finally deprive them. And it would no less deprive the whole body of the educated poor of the hope that the cruel inequalities of this world may be redressed in the world to come. The social change no doubt would be enormous, as Mrs. Lathbury observes, if the dreams of the educational philanthropist were realized to the full; but after all what would be the net result?

> The life of working-men might attain to a pale imitation of that tepid luxury which clubs bestow upon the classes above them. The long day in the coal-mine or the factory may be enlivened by the thought of the contest over the chess-board or the billiard-table awaiting him at night. The more studious might look forward to the hour spent in reading in the unpretending comfort of a free library. The politics of the moment may be sufficiently interesting to give a passing excitement to an evening's conversation, and a popular lecturer might gain a fairly intelligent audience. These are the unambitious aims that really lie at the bottom of many a high-flown eulogy of the education of the working-men; and what does it come to? A little more learning to help a man to know the inevitable depth of his real ignorance; a little more leisure to spend in well-lighted rooms with spillikins and coffee; a little fewer open and violent sins; a little more veneer of the more respectable sins of the upper classes.

There does not seem to be very much in all this to fire the enthusiasm of a thoughtful woman. And it must be further recollected that the strongest intellectual conviction, even assuming it to be well grounded, will not suffice to transform the moral nature, any more than a conviction of the fatal consequences of indulgence, here or hereafter, will quench the flame of vindictive or sensual passion. Can the Agnostic promise that under his teaching the human heart will cease, not only to believe in any higher than our poor human perfection, but to long for it, "or will he lessen the unquenchable desire for reunion with those who are parted from us by death" by convincing his disciples that it is never destined to be gratified? To such queries experience suggests a negative reply. There will still be left an aching void, which material prosperity cannot fill, and which that material adversity which increased knowledge has enabled them to realise more keenly will render doubly sensible to the poor. If then it be true—and surely here Mrs. Lathbury is right—that

"woman's work deals, as a rule, with the individual," what encouragement will the female Agnostic have in her individual teaching of the poor? It is worse than idle to say that she may go on teaching them the old myths. If she has a conscience she cannot do so, and if she has none, she will fail to impress on their belief what she holds to be unbelievable herself.

There is yet a third office in which, more even than in the solace of mental or bodily anguish, woman has hitherto proved herself "a ministering angel." When others, however closely united by ties of intimacy or of blood, have hardened their hearts against the prodigal, she has still claimed the merciful prerogative "of waiting in patience for the turning again of those who have chosen to pursue an evil path." And here, more than anywhere else, Agnosticism must paralyse her efforts, because it dries up the very source of hope. Hope for a better future in the present life alone remains, and towards this the mother or sister of the truant can often do but little. For the revival of his higher nature when at last an opportunity for her influence occurs—perhaps when he is already on his deathbed—she can do still less. To say that "there is no guarantee that Agnosticism will always be confined to highly conscientious people" sounds almost like a sarcasm or a truism, yet it is well to emphasize distinctly what is so strangely apt to be ignored, if not at least implicitly denied. But even the belief in an abstract ideal of virtue would offer but a feeble support to the Agnostic preacher of repentance. It will truly be a sad day for our women when there is nothing between them and their despair about the erring human being in whom their heart's love is centred but the bitter realization of how far short of that ideal he has fallen. To women also, in proportion as they transfer their allegiance to the new Agnostic creed, must "the individual wither, and the world grow more and more." They will be tempted to throw themselves with despairing eagerness into some phase of active work, and neglect that sphere of home life wherein their truer and nobler mission lies. A select few may make their mark in some professional career; for the many who must still seek their occupation in the exercise of their affections, life will have become a dreary, uphill task, with little to sustain or cheer their hearts. This is of course no sufficient ground for clinging, against conviction, to "a creed outworn," but it is surely some reason for hesitation before "sapping with solemn sneers" a faith which has confessedly done much to ennoble and beautify this life, and which perhaps has not yet been quite so clearly proved to have no promise of the next. When all spiritual faith is abandoned, material improvement must be the ultimate term of human progress, and even this will be pursued in a different temper and with lower aims when the background is torn out of the picture on which the mental gaze was fixed. After our cathedrals have been turned into music halls, and we have ceased to build churches or hospitals—there were no hospitals, be it remembered, before the Christian era—it may not be found easy to concentrate the same unselfish enthusiasm on the construction of Board Schools and drinking fountains. What had been viewed as means will henceforth become ends, for there will be no higher end beyond. Mrs. Lathbury does not however ask anybody to believe, or profess to believe, in Christianity, because of the heavy losses entailed by disbelief. But there is much force in her concluding appeal—not confined to readers of her own sex—to those who have made the sacrifice to pause before forcing on others their reasons for the want of hope that is in them. They are not asked to return to a forsaken faith, but merely to remember facts:—

> If it is the lot of any to be obliged through honesty of thought to cast away their ancient landmarks, at least let them consider if it is all gain to others that they should be led to do likewise. What has the Agnostic to offer in compensation? In the strength of his days he sets out for the goal of culture. Physical, mental, moral culture, is his aim and his watchword. Enlightenment in this world takes the place of hope in the next, and the intellect alone sets its seal upon the future. Enthusiastic for all progress, he forgets that a progress that comes to an end with death is no true progress at all, and that which is untrue for the individual cannot be true for the human race. With their faith that of an ultimate age of ice, and their hope bounded by the grave, what is left to the women of the future but their love alone to tell them of how much happiness and misery they are capable? If such is the only truth possible for mankind, in very mercy let us pause long before we help others to attain to it.

CAUTIONS FOR CHOICE OF PARLIAMENT MEN.

A TRACT under this title which appears in the Miscellanies of George Savile, Marquess of Halifax, is naturally attractive to students of comparative history at the present time. The grandfather of Chesterfield and the author of the *Character of a Trimmer* might be expected to have something worth saying on such a subject. The Parliament for which it was written must, to judge from internal evidence, have been that of 1695. Before the writs were issued for that Parliament Halifax was dead, and as the tract refers to the passing of the Triennial Bill at the end of 1694, it must, if it be genuine, as the style declares pretty clearly, have been the work of the last few weeks of his life. The copy before us bears the date of 1700, and seems to have been bought in the next year by Edward Coke of Norfolk. Why and how the volume left the safe and dignified seclusion of Holkham and wandered about in secondhand booksellers' shops, is a question in which nobody but the present Lord Leicester and the possessor of the volume can feel much interest, and the interest of the latter person is limited to the comfortable knowledge that he himself obtained it for a legal and sufficient consideration. A great sage almost contemporary with Halifax would have said that the reason of books straying is *Quis est in illis habitus errandi*; as to the fact, as distinguished from the reason, no one conversant with them will hesitate for a moment.

Halifax, who may be taken as the ideal Moderate Liberal, was very much in the habit of addressing anonymous appeals to the constituencies, and most of them can be recognized by a peculiarity of style, of which he was almost the inventor, but which was quickly caught up by others. This consisted of an elaborate plainness of speech, flavoured with a very pleasant irony. The plainness hit the taste of the average elector, who in those days, as perhaps also in these, was wisely distrustful of tall talk, finical phrases, and exaggerated eloquence. The irony flattered him if he understood it, and did no harm if he did not. The "cautions" are divided, after the fashion of the time, into a great many heads; and the first head of all is sufficiently apposite to the present occasion. "A very extraordinary earnestness to be chosen" the writer thinks to be no good symptom. He deprecates "the raising a kind of petty war, entering the lists rather for a combat than an election, and throwing fireballs to put men in heat." "For," says this cold-blooded person, "it will never be thought that a man should take such extravagant pains only for the sake of doing good to others." And he makes other remarks about "self-denying zeal," "blustering," and so forth, which really seem to have been inspired by a kind of prophetic instinct. In short, the opinion of Halifax upon the Midlothian contest becomes a matter of great interest, but of comparative certainty, when this little tract is read. It is almost startling, too, to come upon the next head, which states that "recommending letters ought to have no effect on elections." Diligent students of contemporary events may perhaps think, *inter alia*, of a certain metropolitan borough, where for some days past one of the candidates has produced at each meeting a letter with the Edinburgh or Birmingham postmark, and has slightly parodied the famous sentiment of Jack Horner by pointing out what a good boy he must be to excite such interest in men so good and great. That "non-attendance in former Parliaments ought to disqualify a man" is a subject which need not now be dilated on, because it is well known that all members of Parliament are now attentive to their business. But head number four again makes us "warm," as they say in the children's game. Our mentor protests with all his strength against men who are "unquiet and busy in their natures." He thinks it pretty sure that "men who cannot allow themselves to be at rest will allow nobody else to be quiet." And he is of opinion that, "their thoughts being in a perpetual motion, they have not time to dwell on anything long enough to entertain a scruple." Obviously Halifax was afraid of persons who thought on the principle of once, twice, thrice, and away. Nor is his phrase of "quietness" unworthy of attention. He would clearly not have thought it a fatal charge that Mr. A.'s policy was a blank, or that Mr. B. has anything to gain by a decisive testimonial that he had in five years upset more institutions and worried more interests than any other single person whose deeds are registered in history. It may be well, however, not to follow this up further, because our author indulges in inferences which would hurt the delicacy of the present age. He hints that his unquiet persons are generally "at full liberty to do what is most convenient for them," and, in short, approaches altogether too near to the scurrilous and shocking.

In the next section we come upon a contrast rather than a coincidence. Does anybody nowadays "apprehend that great drinkers are fit to serve in Parliament"? Evidently many people did so then, and the pamphleteer does his utmost to controvert this opinion in terms which would delight Dr. Richardson and Cardinal Manning, not to mention the late (and perhaps future) member for Carlisle. He admits that the practice of much drinking has "a sociable and well-natured appearance," but opines that "it is by no means to be relied on. Nothing is more frail than a man engaged in wet popularity." It must be admitted that wet popularity is far from being a vile phrase. The argument is strengthened by a curious citation. In 1647, he says, the county of Devon petitioned the House of Commons against the undue election of such burgesses as are "strong in wine and weak in wisdom." Truly a most epigrammatic county! The seventh head attacks the capacity of "wanting-men," *i.e.* men of small property. Here Halifax is something out of harmony with our day, and we pass over his reasonings, albeit they are perhaps worthy of some attention in connexion with such a matter as that which led to Mr. Grissell's imprisonment. Still more is the eighth head to be slurred, for this testifies against the choosing of "blockheads," and it would probably be taken as a breach of privilege to hint that any candidate, much more any member, corresponded to this description. Then Halifax goes on to deprecate the sending of very young men to Parliament—a practice which, if not altogether unheard of nowadays, is certainly not so common as it once was. After this comes mention of "a sort of men whose heads are only appurtenances to their perukes." Here syllogism itself comes to the rescue of the character of our modern Parliament men. There are no perukes nowadays, or at least not many, and so there cannot be many heads which are only appurtenances to them. The argument is irrefragable. As to "men of injustice and violence in their private dealings," "excessive spenders" and "unreasonable savers," these are points delicate to handle, and we shall pass them by. But the thirteenth head will make the heads of its readers bristle with horror. Halifax, benighted trimmer that he was, is of opinion that no one

should be elected for a county unless he has some considerable estate in it or expects such, and he attributes motives for strangers standing which really almost incline one to think that if he were an elector of Midlothian he would vote for Lord Dalkeith. It would, however, be Halifax's turn to shudder at the present day on the subject of his next head. This is directed against the candidature of lawyers of whom there are about one hundred, or is it two hundred?—standing at the present moment. From this point matters become worse and worse. It is perhaps natural in a trimmer to decry "men tied to a party," upon whom he spends some of the finest flowers of his sarcasm, and "exorbitant pretenders to merit in the late revolution," who were doubtless nearly as troublesome in his day as those who now insist upon their admirable conduct in saving Belgium. That "military officers are out of place in the House of Commons" is of course an illiberal opinion on a par with the exclusion of lawyers. "It maketh the room look like a guard-room," says our author, with a fine disgust which at this moment is curiously obsolete. Yet it is pleasant to the fancy to imagine all the captains and majors and colonels, past and present, arrayed in full uniform at St. Stephen's. Objections to "pensioners" and to "opponents of the Triennial Bill," again become less interesting, but the last sentence deserves citation. "In the mean time," says the author, "after having told my opinion who ought not to be chosen, if I should be asked who ought to be, my answer must be, 'choose Englishmen,' and when I have said that, to deal honestly, I will not undertake that they are easy to be found."

We do not know what may be generally thought nowadays of this little electoral manual. It is, as we have said, evident that the author was in many respects a most benighted person. He had no proper appreciation of heroic legislation, and even thought that it was a merit in a member of Parliament to be quiet. He somewhere protests against "trifling" with the business of the House? What, then, would he have thought of obstruction? He is evidently dubious as to the precise merit which ought to be attached to the practice of violently denouncing opponents, and is hopelessly given up to the "stake-in-the-country" delusion. There are even signs about him of infection with the worst of all diseases, patriotism. Nowhere is there to be discerned in his address any reference to anything but the interests of England, and he even seems to be of the opinion that Englishmen would do well to mind those interests. Of the latest lights in constitutional principles he does not seem to have the least inkling. Although there was then a good deal of jealousy between town and country, he does not intimate that the member for St. Michael's was necessarily a better authority on national affairs than the member for Westminster, nor does he tell electors that the expiring Parliament is the worst of all actual and possible Parliaments. Nor does he even hint that his own enemies (and if the author was indeed Halifax he had not a few) are all abandoned villains acting under the direct inspiration of the devil. Indeed, from the general tenor of his observations it may be shrewdly suspected that he would have applied various derogatory terms to this kind of electioneering, and would have talked of "heats," "private enmities," &c. &c. On no occasion throughout his pamphlet does he mount a stump, even of the most moderate height, and altogether it is to be feared that he is, according to modern notions, an inferior person. Yet perhaps in the days when great drinkers were thought fit to sit in Parliament, if in no others, his counsels may have been attended to with some advantage. He seems to have thought that the atmosphere of Parliament was somehow or other very much like the atmosphere of any other place, and that the rules of wisdom, justice, and common sense which applied elsewhere applied also there. Above all—for that last sentence somehow sticks in the reader's memory—he seems to have remembered that he was an Englishman, and to have wished that his clients should remember it too. He had an idea evidently that the English Parliament was meant for England, and seems not to have troubled himself greatly about the concerns of the universe at large, except as they concerned this island, which perhaps he did not think "small" or "little." All these things doubtless were delusions, but somehow a voter reading them just before voting might be captivated with them. This would be a pity, and everybody who possesses Halifax's *Miscellanies* had better lock up his copy, if only to prevent it undergoing the fate which in all probability must have befallen the copy of Mr. Edward Coke of Norfolk.

CHRISTIANS OF ST. JOHN.

"VERILY those who have believed," saith the Koran, "and those who have become Jews, and the Christians and the Sabians, whosoever hath believed in God and the Last Day, and hath done that which is right—they shall have their reward with their Lord, and there shall come no fear upon them, neither shall they grieve." It is very easy to condemn a religion, or to bless it altogether, as Mohammad did in the case of the Sabians; but it is not easy to define who the Sabians were. There are few names to which so many meanings have been attributed, few which have been so grievously misapplied. We call the ancient inhabitants of Southern Arabia "Sabians." The same name denoted the philosophical sectaries of Harran, and the pseudo-Christian remains of Babylonian astrolatry; whilst Arabian writers use "Sabian" when they mean "Pagan," and apply the word indiscriminately to every one in all parts of the world who is neither Jew, Turk, Magian, nor Christian. In the midst of this confusion modern research has had a hard battle to establish a true order and to distinguish between genuine Sabians, so-called Sabians, and Sabians who are not Sabians at all. Quatremère, Renan, Chwolsohn, and Sprenger have devoted ingenious and learned labour to the investigation of the problem involved in the name of Sabian, and we are now able at least to say that most of the peoples known by that name were not Sabians in the true sense. We must disabuse our minds of the notion that this designation has any connexion with the ancient Cushite civilization of the Yemen, and must shut our ears to the seductive resemblance in the sound of Saba and the Queen of Sheba. This wonderful Himyerite people have nought in common with Semitic Sabism, and scholars now distinguish them by the altered spelling of Sabæans.

We must equally exclude from the census of true Sabians the people of Harran, who, if they were Sabian (*i.e.* Nabathean) in race, were Greek in religion. Whatever remnants they possessed of the old Chaldean star-worship were overpowered by the influence of a debased form of Neoplatonism which had reached them from Alexandria. Their very town was known as 'Ἑλληνόπολις (with the sense of "City of Pagans"); and the Arabian historian El-Mes'údí tells us that they had, besides temples dedicated to the stars, others set apart for the worship of Reason and the First Cause, of the Soul, and of Matter. The oldest chronologist of the Arabs, El-Beyrúní, of whose *Vestiges of the Past* Dr. Sachau has lately given us a magnificent translation, speaks of the Harranians at some length, and we learn from him that they reverenced many prophets, "most of whom were Greek philosophers." Beyrúní at first joins in the common error of calling these people Sabians; but subsequently advocates the view that they are not the true Sabians, who are in his opinion nothing else than "the remnant of the Jewish tribes who remained in Babylonia when the other tribes left it for Jerusalem in the days of Cyrus and Artaxerxes. These remaining tribes felt themselves attracted to the rites of the Magians, and so they inclined towards the religion of Nebuchadnezzar, and adopted a system mixed up of Magism and Judaism, like that of the Samaritans in Syria." These "remnants of the Jewish tribes," settled in Mesopotamia, are the true Sabians, he says; for the Harranians, though they are even better known by this name, did not adopt it till A.H. 228, under 'Abbási rule, for the purpose of obtaining the rights of *μετουσία*, or covenanted protection. When El-Beyrúní speaks of the true Sabians as remnants of the Babylonian Jews, he is so near the truth that we must say no more of the Harranians, interesting as they are, but turn to this third people to whom the name of Sabian is applied.

It may seem a startling attempt to seek to trace a connexion between the Tower of Babel and a Christian sect of the Euphrates valley; but nevertheless the descent of the modern Mandæans of Wasit and its neighbourhood from the Chaldeans is tolerably well established. Much laborious research has been expended on the Nabatheans, and the problem of their ethnic position has been complicated by the circumstance that their name, like Sabian, has commonly been used in the East to mean simply "Pagan." From incontrovertible linguistic evidence, however, and from the scanty details we possess of the scientific and astrological theories of the Nabatheans, we are able to assert that they were nothing else than late Chaldeans; and from many and striking resemblances we can certainly trace their descendants in the modern Subbas or Sabians of Mesopotamia, who call themselves Mandæans (*Mando-Yahya*, "disciples of John"), and whom travellers have described under the name of "Christians of St. John." Like their predecessors, the Nabatheans, these "Christians of St. John" speak an Aramæan dialect, a corrupt Chaldee, which Renan calls the *patois de la famille sémitique*. Like the Nabatheans, they have a great reverence for the planets, and time their weighty occasions in scrupulous reference to the positions and conjunctions of the heavenly bodies. Like the Nabatheans, they have a variety of sacred books—a Divan, a Book of Adam, of John Baptist, and the like—some of which we may suspect to be identical with the Scriptures of the Nabatheans. It was probably the existence of these books which procured for the Sabians exemption from the punishment which awaited other unbelievers, as recorded in the verse before quoted from the Koran; for the prophet Mohammad regarded the possession of revealed scriptures as the very condition of a true or nearly true religion. How these Sabians became Christians, or what passed for Christians, is not apparent. Probably they found it convenient to give in their adherence to the dominant faith, just as their namesakes of Harran, under Muslim rule, found it useful to call themselves Sabians, and thus escape the penalties of paganism. But they were doubtless influenced by other motives than those of mere policy. They could not pass through the first six centuries after Christ without coming into close contact with some of the *bizarre* forms of Christianity, or Christianised Judaism, which were floating about in Syria. Renan sees in them the Elchasaites of the φιλοσοφούμενα ascribed to Origen; and Sprenger, in his exhaustive Life of Mohammad, takes a similar view, tracing the religious change of the Sabians into the Mandæans to the influence of Christian Ebionites and Hemerobaptists. The name Sabian, if it has been a cause of confusion by its resemblance to Sabæan, may here be of service to us; for it means, not as the Arabs contemptuously say, "one who turns from his own

religion and takes another," but "a washer"—a meaning fully explained by the frequent ablutions of the modern Mandæans. It is not difficult to understand the veneration with which a sect much given to washing would regard the profession of St. John the Baptist; and we need not be surprised, therefore, at finding him placed in their religion above all other prophets, and even over Christ himself. The belief in St. John the Baptist is not the fundamental dogma of Christianity; and, in point of fact, the "Disciples of John" are no Christians at all. But the name was convenient, and so they turned their old Chaldean mythology into a Christian hagiology, and called their seers and augurs, priests and bishops. In spite of which, they are still genuine Chaldeans in religion as well as speech.

Very little is known of this curious relic of Babylon the Great. Manuscripts of the Mandæan Scriptures exist in various libraries of Europe, but, with the exception of the *Book of Adam* (Codex Nasaræus), edited by Professor Norberg, they have not been published. Chwolsohn, indeed, has thrown the light of his brilliant talents upon the history of the Sabians and their religion, and the finest Arabist of Europe has treated of the Mandaitic grammar with his customary acumen. But we know at present but little of the actual tenets and practices of the "Christians of St. John," and the scanty information gathered by travellers has hitherto been profoundly unsatisfactory. Such is the secrecy observed by the Sabians, so terrible are the punishments prepared for those who reveal the mysteries of the faith to unbelievers, that it is almost impossible to obtain any communications from the people themselves; and the dwellers around know next to nothing about them. They are decidedly "a peculiar people," and they sit not down with the ungodly. Quite recently, however, an unusually favourable opportunity presented itself for a more thorough investigation into the beliefs and superstitions of the Mandæans or Subbas. Two gentlemen, filled with zeal for their respective causes, happened by a propitious fate to be thrown together in the valley of the Euphrates. One was M. Siouffi, the French Vice-Consul at Mosul, the other the Rev. P. Marie-Joseph, head of the Carmelite Mission at Baghdad. The former was on the look-out for a Subba, the latter for a convert. They discovered that their interests were one and decided to work together. M. Marie-Joseph converted a Subba from St. Johnian Christianity to the true Catholic faith, and M. Siouffi immediately set about extracting from him all the information about his people and their religion that Adam—such was his time-honoured name—could supply. The result was a volume of *Études sur la religion des Soubbas ou Sabéens*, which M. Leroux has just presented to the public of Paris. It is full of the most curious notes on Sabian manners and customs, doctrines, superstitions, and the like, and has the advantage in authority which belongs to a work taken down from the lips of a native. Yet it must be taken with some reservation, partly because M. Siouffi was able to hold only imperfect converse with his informer, from which one might expect a certain amount of inaccuracy and misunderstanding in his reports, and partly because the new convert, with all his convert's candour in revealing the deformities of the religion he has abandoned, nevertheless showed some hesitation in answering M. Siouffi's questions on the more sacred portions of the Mandæan faith, and may have concealed more than his questioner could suspect. M. Siouffi's work shows no very thorough acquaintance with the labours of his predecessors, and his ignorance laid him the more open to any imposition which the young man Adam may have sought to practise on him. On the other hand, it is an important fact that Adam was trained for priest's orders in the Mandæan Church, and was therefore doubtless instructed in the greatest mysteries of the faith, if so be that it has an esoteric as well as an exoteric doctrine. Making every reservation, M. Siouffi's book is the most important contribution to our knowledge of the Sabians, or Nasareans, or Mandæans, or Subbas, or "Christians of St. John," choose which name we will, that has appeared since Chwolsohn's *Sabier und Sabismus*.

Since the Sabians became pseudo-Christians, they have taken pains to make it evident that they worship but one God, Alaha; nevertheless the three hundred and sixty celestial personages who are neither angels nor saints, who were not created by Alaha like other creatures, but came into existence of their own accord when Alaha pronounced their names, who possess omniscience and rule each a seperate kingdom in Paradise, and, though married to females of their own species, have children by the mere utterance of a word, are practically divinities. They also reverence their one great prophet, Yahya, or John the Baptist, as one of the three hundred and sixty, and invoke the name of Bahram-rabba, lord of rivers, when they perform their religious ablutions. They believe in evil spirits (Malakún), some of whom execute the punishments of the Mataratas or seven hells, whilst others occupy themselves in tempting and injuring mankind on earth, and cause suicides, sudden deaths, and other calamities. When a man is possessed by a devil of this kind the Subba priest exorcises him. If the devil is of a sweet and docile nature, he will probably go out at the bare sight of the priest; but if he is perverse and obstinate, a regular ceremony has to be performed and the great name of Manda-d-haiy invoked. The fiend usually asks for time, in order to effect his retreat satisfactorily, and at the expiration of the period allowed the priest returns to see if the devil has kept his word. If he is still there, an exorcism is performed on the following Sunday, incense is burned, amulets applied, and prayers recited. The fiend generally leaves at this point, but if he is very obstinate the final resource is tried, and the whole body of priests exorcise him *en masse*. This is considered infallible, unless the devil belong to the species called Kersa-Seyna, the offspring of human beings united to demons, in which case the victim cannot expect release. Adam avers that he has seen and performed many castings-out of devils, and he has no doubt as to the efficacy of exorcism. These spirits live upon food snatched from the tables of men; and it has often been observed, according to Adam, that there is a marked deficiency in the food when any one has spoken during a meal. To prevent this, the Subbas carefully abstain from speaking whilst they eat; and this is believed to be a sure preservation against the assaults of the Jinn.

The world, according to Subba legend, was not created by the supreme Alaha, who was content with making the angels and the Paradise they dwell in. But these three hundred and sixty celestials were not satisfied at this abrupt cessation in the work of creation, and they went in a body to Alaha, and prayed him to make something more. So Hivel-Ziva received instructions, and set out on a long and weary journey to find a certain woman, whose child would be wanted to support the new world. He travelled for centuries, and was sent from one king of the celestial world to another, till at length, in the dominions of King Akrún, he found Ruhaya, whom he soon contrived to carry off and to imprison in a castle of iron until her son should be born. This child, Ur, who speedily grew to gigantic proportions, was destined to carry the world on his head. Hivel-Ziva collected seven handfuls of dust of different metals, and with these he made a pedestal, whereon he set Ur; and then he proceeded to place the seven worlds on his head, one above the other. A drink of the Water of Life caused Ruhaya to bring forth seven other children—six male and one female—who are the seven superior planets; they have souls, and do not perish at the Last Day, and they have each a special function to perform in the universe. Then Hivel-Ziva made the four great rivers, and the four elements, and established the seven hells (Mataratas), each of which is governed by one of the seven great planets; and he created the mysterious world—not our common Arda-Tivel, but that unseen Mshúni-Kuhta, inhabited only by pure and spotless beings. Finally, each world was given a first man; and the hells were made ready for sinners, and put under the control of Avather and Ptahil. They are however, only purgatories for the most part, and souls are allowed, after suffering their appointed torments, to pass thence to the beautiful Almi-Danhúra, the Paradise of the blessed, where the heavenly powers reside. Eternal damnation is decreed only for murderers, renegades from the Subba faith, and seducers of virgins; but the severe penalty attaching to this last sin is seldom referred to by the politic priests, who are afraid lest any of their congregation, rebuked by their consciences, should be driven to despair of salvation, and hence desert the religion that condemned them. These priests, classed in the three orders of deacons, priests, and bishops, enjoy the profound veneration of their flocks, and draw a very large revenue. They are compelled to marry, to eat their meals in solitude, and to fetch water for themselves from the river. The principal religious duties they impose upon their people are frequently-repeated baptism, with complete immersion in the river, in the name of Alaha, Manda-d-haiy, and Yahya Yuhana; prayer at least twice a day, each time lasting two hours or more, addressed to Alaha, Maar-eddarbútha, and the other celestials, Yahya, Adam, &c.; confession, constant ablutions in all possible cases of religious impurity, a species of eucharistic celebration, and a kind of mass for the souls of the dead, which lasts seven days, and is the highest perfection of religious observance. Strict fasting is forbidden, but on certain occasions they abstain from meat. They eat only flesh that is killed by the consecrated sacrificer. They pay the most careful respect to the planets, and have a firm belief in astrology. No voyage or enterprise of any importance is begun without first consulting the stars through the medium of the priests. If they are ill they apply to the priest for an amulet, and ignore the doctor; and they are particular in having the horoscopes of every new-born infant drawn up by their priestly astrologer.

This is what the science of the Chaldeans has come to. These are the representatives of the "wise men from the East." And again, on the other hand, these are the "Christians" of St. John. They are no credit to either side; their astrology is degraded, and their Christianity almost omits Christ. Yet these Subbas, with their Sabian traditions and Chaldean language, with their parody and pretence of Christianity, form a study which is perhaps unique in its peculiar interest. There is no sect which is more closely connected with a remote and obscure antiquity, and none which exhibits a more surprising confusion of contradictory creeds.

THE UNIVERSITY BOAT-RACE.

IT may seem strange in our days that people who enjoy a large share of public favour should be indifferent to it, and even dislike it; but these peculiar feelings are shown every year by the University crews. For a considerable time past the boat-race has possessed inscrutable attractions for the London mob, and also for that large section of society which is as anxious to relieve the monotony of idleness as those who compose the mob are to escape from work. Accordingly the "great aquatic event of the year," as it is called, attracts vast crowds to that very ugly portion of the Thames which lies between Putney and Mortlake; and for

a considerable period before the race the banks are thronged by people who really undergo considerable discomfort in order to see the crews of whose performances elaborate accounts are given by reporters of more or less intelligence. It seems to be generally thought that the young men who constitute the two Eights are performing a public duty in training, practising, and rowing the race; and that, through the medium of its representative the press, the country watches them with great solicitude. This view, however, touching and inspiriting as it is, has never been accepted by those most concerned. Unmoved by the enthusiasm of St. Giles and Whitechapel; unmoved by the fact that they give a large number of people an excuse for drinking champagne in the morning; unmoved even by the yet more striking fact that the betting on the contest is officially quoted, the crews persist in regarding it as not being really a public event, but as partaking far more of the nature of a private trial, interesting only to members of the Universities, and to a certain number of boating men. The impertinence of this assumption has greatly shocked many writers for the press, as need hardly be said; and this year, when the arrogant youths had the audacity to fix their own hour for the race, and to adhere to it, considerable indignation was expressed. It is true that there were very good reasons for rowing at the hour on which they determined. The race, as every one knows, is usually rowed on the last of the flood from Putney to Mortlake, and if this course was to be followed on March 20th, it was clear that the crews would have to start at 7.30 A.M., or thereabouts. The race, it was true, could be rowed at a much later hour by reversing the course, and taking the last of the ebb; but, though this seemed a very simple manner of avoiding the difficulty of an early start, there were really very valid reasons against it. In a race rowed from Mortlake to Putney one crew necessarily has a considerable advantage over the other during the first part of the contest, and this fact appeared conclusive to the misguided young men of the two boat clubs, who probably thought the first essential condition of a race was that it should be as fair as possible; and who perhaps thought also that the question interested them more than it did anybody else, and was for them to decide. Their mistake was speedily made manifest to them. To attend a race at 7.30 or 7.45 A.M., it would be necessary to rise very early, and it was indignantly pointed out that for "the convenience of the public" it was imperatively necessary that the race should be rowed in an unfair manner. At the outset some impression seems to have been produced on the Cambridge crew, and they rather weakly suggested that the day of the race should be altered. Fortunately the Oxford men were sensible, and the question was referred to Messrs. Darbishire, Goldie, and Chambers, who decided that the race should be rowed on the morning of the 20th.

The crews, however, were not destined even now to escape without further pressure. After everything had seemingly been finally settled, Mr. Orrell Lever appeared on the scene as the representative alike of the steamboat interest and of the very many people belonging to all ranks of society who dislike getting up early. Mr. Lever appealed to the crews to row on the ebb, and thus to give "many thousands an opportunity of witnessing the race without undue risk to life or property who otherwise would be unable to do so." Mr. Lever did not mean, as might at first appear, that there might be undue risk to life or property if Londoners had to get up before six, but referred to dangers to be apprehended from the morning fog. His earnest appeal, which was certainly touching, and much resembled those made by missionaries and by promoters of public Companies, fell unfortunately on stony ears. Having asked for telegrams in answer to his eloquence, he received two brief ones, that from the Oxford captain being indeed laconic even for a telegram, and merely informing him that the race would not be rowed on the ebb. At this the ruler of the Citizen steamers waxed wroth, and with cruel kindness informed the sinful captains of seven that, to show his anxiety to accommodate the Universities "for this great national event," he would give a boat free of cost for each University, but that for all others he must charge one hundred instead of fifty guineas as usual. The sins of the crews would therefore be visited on the heads of the sightseers, who would not only have to leave their beds early, but would be required to pay double fares. In consequence of Mr. Lever's decision, some tugs were hired to convey the umpire and spectators, but objections were raised to these, and finally the difficulty with the deeply-hurt but not implacable representative of the national interests was got over. Four steamers, engaged, we believe, on the usual terms, accompanied the race, and it is only fair to say that they were well handled by their respective captains, the Press steamer in particular being very cleverly taken under the small southern span of Hammersmith Bridge.

That there should have been so much hubbub over a very simple question, which really hardly admits of argument, is most strange. The University boat-race is not a "public event," or, as Mr. Lever has it, a "great national event," any more than the Oxford and Cambridge Club is a great national institution. The race is a private trial between crews who represent and are chosen from the boat clubs of their respective Universities, and, as we have said, only concerns members of the Universities and boating men. If the public like to come in huge crowds to see it, of course the public is at liberty to do so, just as it would be at liberty, if it thought fit, to go down in excursion trains to Oxford or Cambridge and throng the banks of the Isis or the Cam; but to say that the public convenience is the first thing to be considered in arranging a race at which, so far as can be ascertained, the presence of the public is not wished for, is to advance a claim on behalf of the multitude which on the face of it is absurd. It has been argued that the University crews do not themselves treat their contest as a private or quasi-private trial, inasmuch as they desire that the course should be kept clear for them, and certainly it seems at first sight as though this did give to the "event" that public character which is so vehemently asserted; but a very little acquaintance with the history of the race is sufficient to show that this is a mistaken view. The course has to be kept clear on account of the great concourse of boats and steamers which would cause danger to crews and spectators, and probably make the race absolutely impossible unless regulations were strictly enforced. In other words, the public come to see the race in such huge numbers that the race could not be rowed unless some kind of order was maintained. It can hardly be seriously argued that by asking for a measure made necessary by the unsought presence of a multitude of sightseers, the crews acquiesce in giving a public character to their contest.

That the crews of this year were right, then, in not yielding to absurd dictation, and in holding to the hour they had fixed, can hardly be disputed, and indeed, even if the boat-race had been correctly treated as a "national event" they would have been right in refusing to change the time. Obviously the race ought to be rowed on equal terms, and the people who wished that it should be rowed on unequal terms in order that they might be saved the trouble of getting up early were not worth a moment's consideration. Mr. Lever maintained, as has been seen, that there would be danger owing to the morning fog; but this was not to be feared, as, if there was enough fog to cause peril, there would be enough to stop the race. Any risks which the steamers might run in going up to Putney could easily be avoided by the very simple process of sending them up the evening before. As it was, Mr. Lever's gloomy vaticinations proved to be in one respect correct, for on Saturday morning a very dense fog enveloped Putney and its surroundings. In spite of this a depressed and blasphemous crowd assembled on the banks of the river; but when eight o'clock drew near, it became evident that they would be able to begin the day's drinking at an even earlier hour than they had expected. Danger to those afloat there would be none, as it was obvious that the race could not be rowed. It was postponed till Monday morning; and though this postponement was much to be regretted, as it must have disappointed many who took a legitimate interest in the race, it had one most excellent result, for it rendered void all bets. According to the mysterious laws of betting, everything is nullified if a Sunday intervenes between the day fixed for an event and that on which it takes place, so that the ingenious gentlemen who had in this case been giving themselves considerable trouble in the hope of reaping an adequate return found that all their pains had been wasted. Their discomfiture cannot but give pleasure to the many who regret that the boat-race should ever have been made the subject of other than trivial wagers. On Monday morning a greatly diminished attendance showed that the interest in the "national event" had suffered much by the postponement. The crowd on the banks was smaller than it usually is; there were very few carriages and, compared with what there generally are, very few steamers and boats. Confidence must have been rudely shaken in the young men who, when fixing the time for their contest, could not foresee that there would be a heavy fog. The young men, however, were in no way affected by their abated popularity, for they rowed a very fine race. After a beautifully even start, they kept all but level with each other for some time, and then Cambridge, rowing from forty to thirty-seven, drew ahead, and led by something like three-quarters of a length when off the Crab Tree, a mile and a quarter from the start. From the Cottage to Hammersmith Bridge the struggle was a very fine one, the light blues, who were rowing far better than had been expected, maintaining their lead. They were certainly aided by the Oxford coxswain, who kept his boat too much inshore in the early part of the race, and who, when near the Distillery, seemed seized with a sudden desire to show how well she would answer her helm. Not to be behindhand in loyal efforts to give the weaker crew a chance, one of the Oxford Eight caught a crab, after Hammersmith Bridge had been passed, with such breadth of style that it seemed almost as if he would capsize the boat. At the time when this accident happened the Oxford crew were gaining on their antagonists, who had rowed a two-mile race with much courage and vigour, but whose strength was now failing. At the western end of Chiswick Eyot the dark blue was from half to three-quarters of a length ahead, and when Chiswick Church was breasted the race was practically decided. The Oxford crew had held to the old tactics which had so often proved successful, and, though they had not seen their antagonists leading without yielding to the temptation to spurt—being, after all, imperfect like other human creatures—they had in the main obeyed the stern dictates of duty, and would not be tempted into rowing so quick a stroke as the others. Their virtue was rewarded in the upper part of Corney Reach, for the Cambridge men were exhausted, and the Oxford boat drew steadily away. When Barnes Bridge was reached the race had become, what in the latter part of the course it so frequently is, a mere procession; and the spectators at Mortlake had the pleasure of seeing a plucky but jaded crew follow in the wake of a comparatively fresh one. The winning boat passed the post with a length and three-quarters of clear water between her stern

and the other's bow, according to the *dictum* of Mr. Fairrie, the judge. To some of those on board the steamers it certainly seemed that the two were separated by a longer interval. The crowd on the banks waited with exemplary patience to learn the result, which, for some incomprehensible reason, appeared to afford them gratification.

The race of 1880, which thus ended in the victory of Oxford, will long be remembered on account of the singular controversy which preceded it, and will also be remembered by boating men as a fine contest, in which the weaker crew surprised the prophets, and made a most gallant struggle. By betting men, also, the race is not likely to be forgotten; and let it be hoped that the recollection of the bitter disappointment which some of them had to endure on this occasion may tend in future to keep them away from the banks of the Thames.

GOOD NEWS FOR HUSBANDS.

A HEAVIER blow has rarely been dealt to the rights of woman than that which was inflicted in the Court of Appeal at Westminster on Wednesday last. Everybody has seen advertisements to the effect that John Smith warns all tradesmen not to give credit to Jane Smith his wife, or, as the warning is sometimes more politely framed, not to give credit to any one in his name without his authority. This invitation of public attention to the domestic relations of the Smith family is naturally taken as a sign that those relations are somewhat strained. Until last Wednesday, however, few people doubted, and no ladies had any doubt at all, that the unpleasant announcement was necessary to bar Mrs. Smith from her ancient and otherwise indefeasible right to run up bills, subject only to the very doubtful construction which might be placed on the word "necessaries." This right has generally been taken to be one of the fairest flowers of the feminine prerogative, and it has been proposed that a certain clause of the marriage service should run "With all the worldly goods of all my tradesmen I thee endow," instead of or as a supplement to the usual formula. It is true that experienced lawyers may have felt a doubt as to the correctness of this opinion, inasmuch as years ago there was a case which the Court of Common Pleas decided in the contrary sense. But even on that occasion one of the judges dissented, and since then it happens that the question has never gone to a Court of Appeal, and has never even in an inferior Court been decided purely on its merits. The case of Debenham *v.* Mellon, which brought out the judgment of Wednesday, was fortunately a typical one. There was no allegation that the goods bought were not fairly to be called articles of necessity. There was no separation between husband and wife, nor apparently any ill feeling between them. But the husband had forbidden his wife to run up bills and the bills had been run up. Therefore Mr. Justice Bowen decided that whatever *primâ facie* presumption of authority there might be was rebutted by the fact of prohibition, and left to the jury only this question of fact, which was not disputed. This ruling was supported on Wednesday by Lords Justices Bramwell, Baggallay, and Thesiger, who were unanimous in their judgment. There must have been wailing and consternation in the counting-houses of not a few tradesmen when the decision was known.

The point of technical importance, of course, is the point whether or not it is necessary for the tradesman to be made aware of the husband's prohibition. It has always been contended by tradesmen themselves that this was necessary, while the unpleasantness of making something like domestic dissension evident has no doubt deterred most men from communicating the prohibition directly. In a case which occurred not long ago, but which unfortunately was not a typical case, as there was misconduct on the wife's side, the judge pointed out the impropriety committed by tradesmen who were in the habit not merely of asking no questions, but of taking steps rather to prevent than to procure information on the subject. It is a general, if not a universal, practice, to direct bills for goods ordered by a lady to the lady herself and not to the husband, whence it sometimes happens that the first thing the latter hears of them is that the tradesman will wait no longer, and he has therefore no opportunity of checking the indebtedness. The wont of tradesmen on such occasions is to defend themselves by saying that "ladies would not like it" if they did otherwise. Lord Justice Bramwell's judgment makes terrible havoc of this ingenious plea. He points out that, though it may be a strong consideration for the tradesman not to offend his customers, that is a matter for the tradesman and not for the law. He might perhaps have added that the cases in which customers were offended would be precisely the cases in which it was desirable that the practice of concealment should not go on. The whole of the learned Judge's argument is full of the most painful common sense, which will make ladies and tradesmen justly and alike indignant. The latter estimable class of persons sometimes affect to be on too confidential, not to say sentimental, terms with their lovely customers to think of questioning their domestic happiness or doubting their honour. According to them, no suspicion of the existence of such a sordid person as a husband who objects to pay his wife's bills enters into their guileless heads. It is the joy, and should be the pride and object, of the husband to collect money for the adornment of the wife of his bosom. "For men must work and women must spend" is the burden of an unpublished version of the late Canon Kingsley's touching song, which is said to have obtained (in MS.) an enormous success in linen-draping circles. It is also rumoured that in the same circles the well-known definition of man's duties, "C'est l'homme qui se bast et qui conseille," is translated, with some amplification, "The husband uselessly fights against his wife's bills, and takes the advice of counsel in vain on the subject." All this pleasant tradition is made of none effect by Wednesday's judgment. Lord Justice Bramwell, contemning the maxim that credit is the soul of trade, asks ruthlessly, "Why should wives have such authority?" The law, he thinks, knows nothing of any general usage in favour of having dress on credit. Perhaps there are people who are not so happily ignorant as the law; but it may be that that august entity knows only what ought to be and not what is. The judge, indeed, makes an exception in favour of the time-honoured weekly bill. So long as a husband lives with his wife, the butcher's bills may be run up without fear on the part of wife or butcher, which is indeed reasonable. Reason, it may be said, dictates the whole judgment rather than a regard for the finer feelings. There are a great many ladies who do not think of running up bills unknown to their husbands, and who yet, we fear, will feel aggrieved at the Lords Justices and their judgment. It is doubtless sweet to feel that opportunities of extravagance are open, even if the individual possessor of those opportunities be too virtuous to profit by them. The killing frost of Wednesday's judgment nips these opportunities, and limits the expensive powers of woman to a prosaic and perhaps beggarly allowance.

It is to be observed that there is one little remnant of the privilege, or rather the supposed privilege, which the judgment has spared. Much of Lord Justice Bramwell's reasoning goes to the extent of a total refusal to wives of any authority to pledge their husband's credit unless usage or permission can be pleaded. The actual terms, however, require that a prohibition shall have been issued, though it may simply be addressed in private to the wife, and need not be communicated to the tradesman, save on his express demand. It may be thought that, with the accustomed perfidy of man, this limitation is dwelt on rather to impress upon husbands the necessity of pronouncing the requisite formula than with a view of saving their last prerogative of expense to wives. But into this question we need not enter. Girls of spirit will doubtless think of forming a league to decline the bonds of matrimony with any man who does not renounce the power of prohibition beforehand. It is our painful duty to point out that here too the odious law has been beforehand with them. It is, we believe, a well-established principle in England that no ante-nuptial contract of such a kind is binding. It is doubtful, too, whether many women —or, for the matter of that, many human beings—would have strength of mind to refuse a definite allowance. "I do not," said an historical character, "know any one to whom a twenty-pound note would *not* be convenient," though we do not intend to hint that a twenty-pound note would satisfy any woman who respected herself. But when the perfidious husband offers a sum which is probably a good deal more than his innocent spouse has ever had lawful command of as a girl, or perhaps tenders the still more tempting cheque book, he has only to remark carelessly "You won't go beyond that," and the thing is done. Common decency demands a grateful and thoughtless "Of course not" in reply, though even the reply is not wanted. The prohibition is issued, and that is enough. From this great wrong a House of Lords cannot be expected to give relief, though there is no knowing what might be done by a House of Ladies. At present the law is clear, and the famous authority of women to pledge their husbands' credit is circumscribed within the narrowest limits. It will run to beef, but not to bonnets; a cabbage may be purchased without and even in spite of authority, but not a costume. A certain abuse, or rather possibility of abuse, is opened up by the exceptions. What if some desperate housewife were to open a truck-system with her milliner, and exchange steaks (expressly sanctioned by name in Lord Justice Bramwell's judgment) for the trappings of vanity? This idea, however, is probably the offspring of a depraved imagination. "How many steaks must I give for one ball-dress?" would be an interesting problem for an examiner of the higher forms of public schools, but hardly anything more. It will be rather curious to see whether the decision has any effect on the general practice of tradesmen. Many things have combined of late to hit hard the old practice of combining long prices and long credit. This judgment, though by no means likely to end retail dealing on credit, which is in some respects a convenient practice enough, must tend further to restrict it. It has very rarely been pronounced so authoritatively that in such dealing the law, if it does not exactly refuse to recognize credit, looks on it with a certain amount of disfavour. The burden of ascertaining the truth is, almost for the first time, thrown directly on the tradesman. Nor can it be said that it is unfair thus to throw it, because the balance of profit in the transaction undoubtedly lies with him, as is clearly perceived from the wide margin existing in most cases between cash and credit prices. Of course ladies are not alone in a leaning to credit, but perhaps it may be said that they are apt to continue fond of it longer than men, partly because of the very customary opinion which the Court of Appeal has just pronounced to be fallacious. Sooner or later a man has to pay his own bills; in the theory referred to a woman when once she was married had an almost unlimited credit to draw on. It is not very likely that

many ladies will expose themselves to the awkward consequences which, as was hinted in the judgment, would follow a false representation of authority; nor even in this case would the tradesman benefit. On the whole, nobody who need be much pitied suffers from the decision, and to a class of men who, with many and grave faults, possess after all some merit, and form a considerable proportion of the nation, it is distinctly good news.

THE STAFF COLLEGE.

IT appears that the subject of the Staff College is again exercising the minds of the military authorities, and a preliminary investigation is now being prosecuted which may or may not lead to the adoption of that panacea for all the ills that British institutions are heir to—a Committee of Inquiry. One of the principal questions to be propounded is whether the present regulations ensure that the best men—that is, the men best suited morally and physically for the staff—obtain admission to the College; and before proceeding to discuss this question it may be well if, for the benefit of our civilian readers, we state fully what those regulations are. An officer wishing to compete for entrance to the College must make his application while actually serving with his regiment or corps. He must have five years' service at least, and must produce a certificate from his commanding officer to the effect that he is in every respect a thoroughly good and efficient regimental officer. A Board consisting of the three senior officers of his regiment then reports confidentially upon the following subjects:—Whether the candidate's conduct is marked by steadiness, prudence, and temperance? Is he extravagant in his mode of living? Does he display activity, intelligence, discretion, and zeal in his profession? Is his disposition such as would enable him to perform the duties of the staff with tact and discrimination, in a manner calculated to ensure that orders which he might convey would be cheerfully carried out? or are his manners and temper objectionable and likely to cause him to disagree with those with whom he might be brought in contact? Is he active and energetic in his habits? a good or indifferent rider? and is he short-sighted or deaf? A medical certificate of good health and fitness for the active duties of the staff must also be furnished. Finally, the candidate must be attached for a month to the staff of a general officer, who at the end of that period will report confidentially on the officer's general fitness for staff employment, and especially on his aptitude for business and for conducting official correspondence. These preliminary tests being satisfactorily passed, the candidate may present himself at the competitive examination for admission to the College.

Now it might not unnaturally be supposed that an officer who combined in his own person all these qualifications, and who moreover possessed sufficient brains to place him among the successful twenty at the examination, would be something very much like perfection itself, and certainly admirably adapted in every way for the duties of the staff. It might also be supposed that by the time such a paragon had passed safely through the arduous and varied course of instruction at the College, he would be something quite too perfect—in fact, a combination of physical and intellectual excellence seldom to be found out of three-volume novels. Unfortunately, perfection is notoriously difficult of attainment, and it is well known in the service that here and there an officer obtains access to the College who does not by any means come up to the required standard of regimental efficiency. Let us suppose the case of an officer of some nine or ten years' service, who has spent nearly the whole of it with his regiment, taking his full share of foreign service and no more than his share of leave. He subscribes to all the regimental clubs and institutions, entertains guests at the mess, goes into society, and generally supports the credit of the corps. Possibly he has served with it in one of our numerous little wars, and wears a medal. Yet, in spite of all this, it is remarked that he is kept perpetually in the background—in a word, that he never comes to the front. His turn for detachment never seems to arrive, the adjutant being always ready with some unanswerable reason why his company is not to go just then. If his colonel is ordered to detail an officer for some special duty, he is sure not to be the one chosen. In short, he is kept under continual supervision, not from any actual or openly expressed dissatisfaction with him as an officer, but simply from a feeling that he had better not be trusted in any independent capacity. While he may be an excellent subordinate, no one ever dreams of placing him in any situation of command. The officer in question, having always been of a somewhat studious turn, determines one day to try to vary the monotony of regimental routine by going to the Staff College, and forthwith begins to study. When he feels himself sufficiently advanced, he formally announces his intention to his colonel and applies for the necessary certificate. The colonel at once finds himself in a dilemma. On the one hand, he feels perfectly convinced that the applicant has not the makings of a good staff officer in him, and he also knows that this conviction is shared by the regiment in general. On the other hand, is he to take upon himself the responsibility of depriving an officer against whom he can adduce no actual shortcomings of a chance of distinction? May he not after all be mistaken in his opinion, and is it not well known that many who have not been good regimental officers have succeeded on the staff? In despair he turns to the copies of his own and his predecessor's confidential reports on the officer in question. He finds such terms as "careful," "steady," and "attentive," in abundance—in a word, all is mediocrity—and nothing further. But he cannot make up his mind to say "No," so the certificate is promised, and the candidate is passed on to the regimental Board. Here, again, there is the same unwillingness to cast the first stone at an old comrade, and eventually the examination is passed successfully, and he joins the College.

In this way, doubtless, some men who cannot be said to be thoroughly good regimental officers succeed in getting on the staff; but they are the exception, and not, as represented in certain quarters, the rule. Even when such officers have joined the College, they may fail at either the first or second yearly examination, or they may be unfavourably reported upon by the College authorities and removed. That the present system regulating admission is not perfect we admit; still the tests demanded are fixed at so high a standard that we can hardly wonder if they are not always rigidly fulfilled. Nor is it easy in time of peace to suggest any improvement on the old system of selection for the staff, which may be briefly described as nepotism tempered by favouritism, and anything is better than that. The real advantage of the Staff College is that it provides a body of men who must at the worst have been fairly good regimental officers, who possess a considerable share of brains and intelligence, and, more than all, who have proved their capacity and willingness for work. Thus a certain fixed, tangible standard of merit is provided; and we cannot at present see how any other system would answer better. For example, it has been laid down, and very justly, in the Queen's regulations, that officers who have not passed through the Staff College may yet be eligible for staff employment if they are of "proved ability in the field"; and there is no doubt that, if the term be accepted in its full and proper sense, such officers should have precedence of all others. But what is "proved ability in the field"? Will any two authorities agree in their definition of the term? An aide-de-camp or an orderly officer who safely delivers an important despatch at a critical moment may be considered by one general to have proved his ability, while another would ridicule the idea. The very vagueness of the term is dangerous, and in a protracted campaign might open the door to serious abuse. As we have already said, we are not prepared to suggest any improvement on the present mode of supplying the staff of our army. The intellectual and educational part of the process is an actual reality, which cannot be gainsaid or controverted; the moral part is, and must remain, to a certain extent, a matter of opinion; and where this element is once introduced into the question we must allow for human fallibility. Whatever faults there are in the system occur not in the College, but in the regiment; and the sole remedy that can be applied is for commanding and superior officers to harden their hearts and speak their opinions freely.

Another subject connected with the Staff College which will probably form a matter of inquiry is the curriculum of study. This, however, is comparatively a matter of detail, and doubtless some room for improvement may be found. There used to be, if we mistake not, an undue preponderance of subjects which are, or rather should be, left entirely to the Engineers and Artillery. For instance, permanent fortification was carried to an extent which would certainly appear excessive when it is remembered that, wherever siege operations on a large scale are undertaken, there are sure to be a sufficient number of engineer officers present. Again, the study of the manufacture and working of the heaviest guns, such as are only used on board ship or in places like Gibraltar or Malta, would appear unnecessary, for we certainly cannot be said to suffer from a dearth of artillery officers. It is constantly urged that the College course is too theoretical and not sufficiently practical; but for this there is no remedy. With the exception of the limited extent of country around Aldershot, every inch of which is familiar to nearly every officer in the service, we have no ground available for instruction. A certain sum is appropriated in the College estimates for manœuvres, and accordingly once a year the commandant, professors, and students sally forth for a four or five days' trip, during which imaginary troops are conducted through imaginary operations, the sole reality about the affair being the expense. Practical training, whether for officers or men, means an unlimited extent of varied country, which with us is an impossibility. Some improvement on the present course may, however, be made with advantage, for military science is perpetually developing fresh features which demand attention and study.

There can be no doubt that the Staff College has done, and is doing, immense good in a quiet unobtrusive way. It has brought to the front dozens of good men who must otherwise have rusted in obscurity for want of interest, and, more than this, it has indirectly raised the intellectual level of our officers in general, inasmuch as every candidate who succeeds represents three or four more who, though they have failed, have yet studied. The names of such men as Evelyn Wood, Pomeroy Colley, and Redvers Buller—the latter of whom, however, quitted the College on service before completing his course—ought to convince the most sceptical on this point. As we remarked on a recent occasion, the nation is just now a little out of temper with military education in general; but, at any rate, we hope that the utility of the Staff College may not be impaired.

THE NEW BANKING ACT AT WORK.

THE *Statist* of Saturday last contains a very full and detailed account of the progress made under the new Act in limiting the liability of shareholders, the leading points of which are highly interesting. It may be recollected that about a month ago the Chancellor of the Exchequer stated in the House of Commons that he was unofficially informed that more than half the unlimited banks had decided to avail themselves of the benefit of the Act of last year. The *Statist* has been at the pains to verify this statement, and it brings out a great number of other facts which the Minister could not touch upon in reply to a question. It will be seen, from what we proceed to show, that the success of the Act has been much greater and prompter than was generally expected. The Act was permissive, and for that reason it was commonly assumed that it must fail. The banks, it was said, never could come to an agreement among themselves, and without an agreement each would be afraid to act, lest it should give an advantage to its competitors. Moreover, the Act was passed in a hurry. Some clauses to which importance was attached were left out, and amendments very much desired were not seriously discussed. It was argued that legislation manifestly so incomplete could not be final; and it was concluded that bankers would wait for a more thorough measure. The obstacles which the Act had to overcome were therefore considerable; and the success it has attained is, for that reason, the more remarkable.

When the Act was passed matters stood in this way. Not reckoning the Bank of England—which, of course, is a limited bank, and to which the measure does not apply—there were altogether thirteen metropolitan banks, four of which were unlimited and nine limited. The four unlimited had a paid-up capital of 5,195,000*l.*, a reserve fund of 2,269,000*l.*, and shareholders numbering 11,596. The limited, on the other hand, had a paid-up capital of no more than 2,578,000*l.*, and a reserve fund of only 471,000*l.*; while the number of shareholders was barely 3,077. It will be seen from these figures how inconsiderable the limited banks were in comparison with the unlimited, here in London at least. Though in the proportion of nine to four, they had not half the paid-up capital; they had only one-fifth the reserve fund, and they had little more than a quarter of the number of shareholders. Indeed one single unlimited bank, the London and Westminster, had 50 per cent. more shareholders than all its nine limited competitors taken together; it had more than twice as large a reserve fund; and it had nearly four-fifths of their paid-up capital. But a great change has now taken place. Two of the four unlimited banks have decided to become limited, and their paid-up capital amounts to 2,600,000*l.*, or more than half the aggregate of the four; their reserve fund is also more than half, being 1,219,000*l.*; and the number of proprietors is nearly half, being 5,700. Thus the state of the case in London now is eleven limited banks, with a paid-up capital of 5,178,000*l.*, a reserve fund of 1,690,000*l.*, and 8,777 shareholders. On the other hand, the unlimited banks are only two; their paid-up capital is 2,595,000*l.*; their reserve fund, 1,051,000*l.*; and the number of shareholders, 5,896. Therefore, among the purely London banks, the unlimited have but half the paid-up capital, and they are weaker also as regards reserve fund and number of shareholders.

Coming now to the banks that are partly metropolitan and partly provincial, we find that when the Act passed three were unlimited and six limited. The three unlimited had a paid-up capital of 3,537,000*l.*, a reserve fund of 1,890,000*l.*, and their shareholders numbered 9,639. The six limited banks of the same class had a paid-up capital of 1,780,000*l.*, a reserve fund of 306,000*l.*, and their shareholders numbered 5,654. Here also, it will be seen, the limited banks were incomparably weaker than their unlimited competitors. But here the change has been complete. The three unlimited banks which were partly metropolitan and partly provincial have all decided to become limited. Consequently, the statement regarding this class of banks now is—they are nine in number; they are all limited, or becoming limited; they have a paid-up capital of 5,317,000*l.*, a reserve fund of 2,196,000*l.*, and the number of their shareholders is 15,293. Coming in the last place to the purely provincial banks, there were of these, when the Act passed, fifty-five unlimited and forty-three limited. The fifty-five unlimited had a paid-up capital of 12,116,000*l.*, a reserve fund of 7,036,000*l.*, and the number of their proprietors was 20,146. The forty-three limited banks had a paid-up capital of 8,307,000*l.*, a reserve fund of 3,584,000*l.*, and the number of their shareholders was 19,525. In this class, it will be seen, the pre-eminence of the unlimited banks was by no means so marked as in the other two. Their paid-up capital exceeded that of the limited banks by less than one-third; and there was not a great disparity of numbers as regards the shareholders. The change that has now taken place has transferred the superiority altogether to the limited banks. Twenty-three purely provincial banks formerly unlimited have decided to become limited. Of these the paid-up capital amounts to 5,368,000*l.*, the reserve fund to 3,418,000*l.*, and the number of shareholders to 10,824. The result is that the purely provincial banks already limited, or becoming limited, number sixty-six; their paid-up capital amounts to 13,675,000*l.*, their reserve fund to 7,065,000*l.*, and the number of their shareholders to 30,349. On the other hand, the banks of the same class remaining unlimited now number no more than thirty-two; their paid-up capital amounts to only 6,730,000*l.*, their reserve fund to 3,608,000*l.*, and the number of their shareholders to 9,408. In other words, the purely provincial banks remaining unlimited are, as respects number, paid-up capital, and reserve fund, less than half as strong as the limited, and have not quite one-third as many shareholders.

To sum up what we have said, the case stood thus when the Act received the Royal assent; there were in England, Wales, and the Isle of Man altogether sixty-two unlimited banks, having an aggregate paid-up capital of 20,848,000*l.*, a reserve fund of 11,195,000*l.*, and shareholders numbering 41,381. Of limited banks there were altogether fifty-eight, having an aggregate paid-up capital of 12,665,000*l.*, a reserve fund of 4,361,000*l.*, and shareholders numbering 28,256. Thus in capital the limited banks had about three-fifths as much as the unlimited, and nearly three-fourths as many shareholders. Now the state of the case is as follows:—The number of unlimited banks is reduced to thirty-four, their paid-up capital to 9,325,000*l.*, their reserve fund to 4,659,000*l.*, and their shareholders to 15,304. On the other hand, the number of limited banks has been raised to eighty-six, their paid-up capital to 24,170,000*l.*, their reserve fund to 10,951,000*l.*, and their shareholders to 54,419. The number of limited banks is now 71·7 per cent. of the whole, their paid-up capital 72·1 per cent.; their reserve fund 70·2 per cent.; and the number of their shareholders 78 per cent. In other words, whether as respects number, capital, or shareholders, they constitute almost three-fourths of all the banking interest of England. Even this, however, does not represent the whole extent of the movement. At the end of the article referred to, the *Statist* prints a list of the banks still remaining unlimited, and in two columns it sets out any expressions of opinion on this subject contained in the reports lately issued, or elicited at the shareholders' meetings, and also any declarations of policy made. From this analysis it appears that out of the thirty-four banks, sixteen, or almost one-half, have expressed themselves in favour of limitation of liability, but for one reason or another have decided to take no step as yet. It is highly probable that of these sixteen some will follow the example so generally set them the next time they meet their shareholders. On the occasion already referred to, the Chancellor of the Exchequer stated that the Government does not intend to legislate further in the matter. If the coming elections, then, result in a Conservative victory, the prospect of an amending Bill will become so remote that it is almost certain that such of the banks as are only waiting for further legislation will see the uselessness of waiting any longer. If, on the contrary, the Liberals gain a majority, it is likely that the banks which as yet have made no change will put off doing so until they have learned the intentions of the new Ministry. But sooner or later the universal limitation of liability appears to be assured. The figures we have quoted prove beyond a doubt that the Act of last year was no mere panic legislation, but was passed in response to a very genuine and well-founded demand. The Act, as we have already said, was not thoroughly considered, and is very incomplete; but with all its imperfections it has been accepted as a boon, and its provisions resorted to so generally and so promptly that we may be pretty sure the other banks will follow.

It is very desirable that they should do so. We need not now dwell upon the danger of a deterioration in the proprietary of banks which remain unlimited. This matter has been sufficiently discussed already. But there is another point of view from which, perhaps, the question has not been sufficiently regarded. Unlimited liability undoubtedly encouraged the giving of credit where credit was not deserved. It is notorious that the Glasgow Bank was able to continue the malpractices which ruined so many hundred families, solely because the liability of its shareholders was unlimited. Its acceptances were given so recklessly, and were put in circulation in such enormous numbers, that again and again people grew alarmed, and made up their minds to have nothing more to do with its paper. But after a while they reflected that the Bank was unlimited, and that consequently, whatever might happen, the unfortunate shareholders would be responsible to the last penny belonging to them. It is in the highest degree improbable, indeed, that mismanagement such as that of the Glasgow Bank will soon again be witnessed. But mismanagement of a lesser kind is always to be apprehended, and unlimited liability indisputably fosters it. In another way, too, its influence is injurious. One of the great difficulties bank managers have to contend against is the accumulation of deposits in larger amounts than they can profitably employ. Of course the giving of interest attracts these deposits, and is thus at the root of the mischief. But it cannot be doubted that unlimited liability also counts for something in the matter. And it will be a relief to the banks themselves as well as a public advantage, if the movement now on foot should permanently check the undue accumulation of deposits which cannot be safely and prudently employed.

PICTURE EXHIBITIONS.

M. DE NEUVILLE'S battle-piece, "The Defence of Rorke's Drift," is now being exhibited at the Fine Art Society's rooms in New Bond Street. The picture is in many respects a remarkable one. It cannot be easy for a French painter, completely used to painting French scenes of battle, to adapt his figures to the English type. This M. de Neuville has succeeded

thoroughly in doing; and in this respect it is highly interesting to compare the finished picture with the small study which hangs on its right hand as one enters. This study, unlike the one on the left, takes a different view of the situation, and is extremely sketchy; but in spite of its sketchiness all the types are obviously French. The finished picture has remarkable force and spirit; and the details, thoughtfully conceived and admirably executed, combine to make a striking and lasting impression on the spectator. Every salient feature of this gallant defence which has been recorded is given its proper importance by the painter, who, while he has spared no pains in this matter, has made his composition impressive as a whole. The detached figures, among whom Lieutenants Chard and Bromhead, Surgeon Reynolds, and the Rev. George Smith are prominent, stand out with due force; but there is no suggestion of the general effect being sacrificed to any particular detail. We have heard it objected that M. de Neuville has erred on the side of suppressing the "sensationalism" which some painters might have been tempted to get out of the savage bravery of the masses of Zulus, but it seems to us that in this matter his instinct and judgment have been highly artistic. There is, we think, more strength in the suggestion of the surging herd of warriors nearly hidden by the smoke, in which only a few figures are distinguishable, than there would have been in a more direct representation. The attention is fixed, as it should be, on the defenders, and their gestures, looks, and attitudes give a complete enough idea of the odds which their bravery has to encounter. If any fault were to be found with the actual painting of this fine work, we should be inclined to discover it in the flames which issue from the burning hospital; but flame is, no doubt, an exceedingly difficult thing to paint. There are, as we have hinted, many striking points of detail in the picture, among which we may refer to the expression of the wounded corporal on the left, who seems to forget his hurts in his excitement over the fortune of the fight, and to the admirably lifelike look of Surgeon Reynolds's bull-terrier in the central group. Altogether the picture is, as may have been supposed from what we have said already, a fine representation of a most impressive incident of warfare. The description of the work issued in the gallery is complete and careful, and contains the nominal list of all those who were engaged in the defence. There is considerable interest to be found in the comparison of the finished picture with the two small studies which hang on either side of it.

The present exhibition at the French Gallery, though it contains no such striking pictures as M. de Neuville's "Le Bourget," exhibited there some little time ago, is well up to the mark in general excellence. One of the most remarkable pictures to be seen there is M. Olivier Merson's "Flight into Egypt" (8). This is a work of which the general impression is fine. It represents with much accuracy and beauty a calm starlit night in the plains. The atmosphere is admirably luminous; and at first sight the figure of the Sphinx, against one paw of which the Virgin lies sleeping with her child in her arms, is imposing enough. Unfortunately, a further examination will show that the Virgin must be, at a moderate computation, about forty feet high. In spite of this curious blunder, the quality of light in the picture, and its general idea, cannot but prove attractive. Corot's "Lake Nemi" (17), with a single figure of a bather climbing out of the water, which hangs on the same wall, is a fine specimen of the master's work, and shows in a marked degree his pathetic sympathy with, and power of interpreting, the shifting moods of nature. On the opposite wall is a large, but not particularly admirable, picture by M. von Angeli, entitled "The Avenger of his Honour." The work is strictly conventional, and painted with a painfully smooth accuracy. It might pass, with a few alterations, for the death of Rizzio; but to us it is suggestive of nothing so much as of that well-known and clever satire in etching, "La Fin de l'Acte à L'Opéra." Of the other large pictures M. Salmson's "An Arrest in Picardy" (159) has much truth and movement, the figure of the accusing woman shaking an angry fist in the culprit's face being particularly good, while the atmosphere of the whole work is remarkable; and M. Billet's "Avant la Pêche" (186) is a delightfully bright and pleasant composition, something in the manner of M. Israels in his happier moods. M. Constant's "Sur les Terrasses—Tanger" (172) is an odd work, gorgeous, but not altogether pleasing in colour, and the principal figure is a woman with a painfully and startlingly masculine head. M. Kauffmann's power of humour is illustrated in several small works, amongst which we may single out for special praise "The Village Belle" (123). M. Heffner sends some striking and beautiful landscape studies, the best of which perhaps is "The Forest Glade" (200). The Gallery contains many imitations, varying in merit, of M. Meissonier's style, and M. Domingo, a master in the same school, is represented by a tiny work, "A Game of Piquet" (206), in his accustomed manner, the full merit of which can only be discovered by the aid of a magnifying glass. M. de Neuville sends a finely painted, but not very interesting, picture, "Giving the Password" (23); and Mr. Alma-Tadema a charming little episode of antique life, "A Well-Protected Slumber" (205).

Mr. Frith has painted, and Mr. Tom Taylor has described in a handbook issued to visitors, a series of anecdotes on canvas entitled "The Race for Wealth," which are shown at the King Street Galleries. Mr. Tom Taylor goes audaciously to work. On the first page he strikes the parallel between Mr. Frith and Hogarth; quoting from the latter his explanation of the essentially dramatic purpose of his paintings. "I have endeavoured," wrote Hogarth, "to treat my subjects as a dramatic writer, my picture is my stage, my men and women my players, who by means of certain actions and postures are to exhibit a dumb show." No doubt Mr. Frith has also endeavoured to do this; but beyond that point the parallel suggested by Mr. Tom Taylor will not hold good. He might as well have quoted in defence of Romeo Coates, to keep to Hogarth's dramatic metaphor, the "endeavours" of Garrick to interpret the character of Romeo. Mr. Frith's productions are dramatic in the same sense in which the performances of a bad actor are dramatic, and, with the exception of one single figure in one of the groups, in no other sense. The exhibition of "a dumb show" may have high interest, but that depends upon the figures having the attributes of life, and seeming as if they could speak if they would. This is what is found in the works of the great painter between whom and Mr. Frith Mr. Tom Taylor has ventured to suggest a comparison, and it is precisely what is not found in the works of Mr. Frith. The figures are no better than dummies; and the accompaniments of the figures, the furniture and appointments of each scene, are painted in the most dingy and scratchy manner, instead of being, as in Hogarth, instinct with the full skill of a master of his craft. The first of Mr. Frith's series shows the interior of a speculator's office, with various details, all of which Mr. Tom Taylor, who never aims at criticism throughout his showman's catalogue, describes at length. In one instance he displays something of the imagination which some superior showmen put into their "patter," for he discovers "a touch of ruth" in the profoundly inexpressive face of a young clerk who is exhibiting a mining map. In doing this he does injustice, it would seem, to the subject of his eulogy. We cannot suppose that Mr. Frith thinks such a speculator as he represents would not take care to inspire "young clerks" with belief in himself. The clock, Mr. Tom Taylor points out to us, "marks half past eleven"; and he proceeds to comment on this exquisite touch by saying, "Visitors can be early in the city on such business—the greener, the eagerer." The second scene, an "at home" at the speculator's house, is chiefly remarkable for the fact that in the pictures on the walls "we can identify work of Turner, Egg, and C. Leslie, Frank Stone, and Linnell." This is, of course, profoundly interesting. The third scene is ushered in with notes of admiration. "The bubble has burst! The blow has fallen! We are in the cosy breakfast parlour of the comfortable country rector," of whom Mr. Tom Taylor goes on to say that "he sits with bowed head in collapse; who shall say with what bitter whisperings of self-reproach?" To us, we confess, he looks remarkably stolid and comfortable, perhaps a trifle sleepy. As for the "young sailor-boy, new (*sic*) come home, who sits in his naval cadet's jacket, the focus of the glow and light of family love," he is even more of a dull and wooden doll than the two daughters, who "have started up, their arms round each other, as if for mutual strength and support." The one good touch in the group and the one and only good thing in the series is the figure of the mother, which has some real feeling. We need hardly go at length through these performances. We have already dwelt upon their commonplaceness, their want of invention and imagination, and it is only necessary to add that their flatness and vulgarity is not redeemed by any technical excellence. Mr. Tom Taylor's guide-book is admirably suited to its purpose, and ends with these profound remarks, "The race for wealth has been run. We see the end of one of 'the favourites.' Perhaps if we could follow the others whom we saw entered for the race, we should find their finish, if less ignominious, hardly more happy."

REVIEWS.

THE TEMPLE AT BUDDHA-GAYÂ.*

THE disinterment of some Merovingian King who looks upwards in placid majesty for a moment from his golden shroud, and then, shroud and all, collapses into dust, is but a type of what happens more slowly in other cases. Some building, perhaps but a fragment, which has lain unknown and unvisited for two thousand years, is discovered, fresh in beauty and sharpness of detail, preserved perhaps by the rubbish-heaps with which its would-be destroyers had covered it; a few years pass and its treasures of rarity and beauty have disappeared; often no one can tell how or why. Sometimes, indeed, the how and why is obvious enough. Thus General Cunningham, defending his action in removing the best sculptures of Bharahut against the lamented Professor Childers, who found in the proceeding "an aroma of Vandalism," says justly:—"I am willing to accept the *aroma*, since I have saved all the more important sculptures. Of those that were left behind, *every stone that was removable has since been carted away by the people* for building purposes." In any case we must accept the dilemma. The veil of ages once lifted cannot be replaced. What we should desire then is speedy and accurate measurement, description, and illustration, before the inevitable acceleration of decay begins. These remarks are suggested by two works which

* *Buddha-Gayâ; the Hermitage of Sâkya Muni.* By Rajendralâla Mitra, LL.D., C.I.E., &c. Published under the Orders of the Government of Bengal. Calcutta.

have recently reached us, both illustrating Buddhistic localities of great interest—namely, General Cunningham's account of the Stúpa of Bharahut (with which we shall not deal at present), and Dr. Rajendralála Mitra's monograph on Buddha-Gayá. The latter has been described not a day too soon, and to the learned Doctor and Pundit thanks are due for his endeavours to secure a record of what remained before decay and vandalism should have done their worst.

Buddha-Gayá never sank into the safe oblivion that shielded the fragments of Bharahut and Amarávati, two places the origin of whose sanctity can only be surmised. Benares, where Sákya first preached his doctrine, has become the metropolis of another Law. Kapila, his birthplace, Kusinagara, the place of his Nirvána, had passed out of sight and memory, till rescued by the same engineer officer whose services to Indian history will never allow the name of Cunningham to be forgotten. But Buddh-Gayá, even after the last pool of Buddhist doctrine had dried up in India, continued to draw from foreign lands devout pilgrims with presents and well-intentioned restorers. Its sacredness was due to the fact that round its ruined shrines once stood the groves of Uruvilvá, where Sákya passed through his six years of asceticism; and here beneath a pippal tree on the banks of the Nairanjaná—the Liláján of our day, probably the Erenysis of Megasthenes—after abandoning asceticism as vain, he accomplished the "meditation of perfection" by which he was believed to have achieved the Buddhahood. If any one would read in pleasant and poetic abridgment what befell this prince of hermits in the years of his penance and in the days of his final struggle and victory, we refer him to the charming quasi-Tennysonian verse of Mr. Edwin Arnold, which has lately won him from the sympathetic King of Siam the appropriate Order of the White Elephant.

Here then at *Buddh*-Gayá—so called to distinguish it from other localities of Hindu sanctity in the same district—sacred sites were crowded together as closely as the holy places of Jerusalem in the traditions of the monks:—

> Every spot where the Saint had rested or taken his meal, every pool in which he had laved his person or washed his scanty raiment, every nook or corner connected in some way or other with his long-protracted meditations and self-torture, once had its recording-stone; and nothing was left undone to produce an unintermitted page of monumental history for the period he devoted to the acquirement of perfection in the knowledge of good and evil.—p. 21

Of these sacred places the focus and most sacred of all was Bodhidrúma, the Tree of Understanding, the pippal under whose shade the climax had been reached. And for all these local monuments of Buddhist tradition the Chinese Hwen Thsang's narrative remains to us an indicator, like those of the Arculfs, and Willibalds, and Burchards of the earlier and later middle ages for Jerusalem. He found the Bodhi-tree (*c.* A.D. 637) surrounded by an oblong walled enclosure of brick, some 20 feet in height and 500 paces in circuit, and girdled with umbrageous trees. In the centre of this enclosure stood the "Diamond Throne," dating from the foundation of the world. When all the world quaked this throne alone was unmoved, and seated on it all the Buddhas of past ages had achieved the divine climax of wisdom and power. And there, immovable it still remained; only, since the degeneracy of this latter Kalpa, sand and soil had spread over the precious adamant, and it was no longer visible. Above its site, however, still grew the tree, which had undergone many vicissitudes, but survived them all. Close on the east of the tree was a lofty *vihára* (the word originally meaning a place of recreation, then a monastery, but, like that word in its other shape of *minster*, often used as here for the shrine attached to the monastery), "built of blue bricks covered with lime," 160 or 170 feet in height, with a base of 20 paces square. Its façades rose in tiers of niches, each containing a figure of Buddha, and combined with other elaborate sculptures and images of Rishis or holy anchorets, the whole crowned with a gilt copper *amlaka*, the *donla* or emblic myrobalan—in fact, with a many-lobed orange-like spheroid. On the east side (that of the entrance) a two-storied pavilion had been erected, in contact with the tower, bearing a high-pitched triple roof. Of the many sacred sites and buildings described by Hwen Thsang, this, the great temple, alone remains manifest. The Brahmans have adopted the general traditional sanctities of the place, though not now occupying that monument. A Sivaite monastery has been built at hand; and, by a strange perversion, many of the numerous votive dagobas which had gathered round the Buddhist shrine have been adopted as the gross emblem of Mahadeo, and planted over the sepulchres of defunct sanniyásis.

Curious questions have arisen as to the age of the great temple as we now see it. General Cunningham, after showing in detail the remarkable precision with which it agrees in dimensions and in several other particulars with those given by Hwen Thsang, comes to the conclusion "that we now see before us the very temple which Hwen Thsang visited and described in A.D. 637. To all those who have seen the temple this opinion has appeared equally certain and conclusive" (*Archæol. Reports*, vol. iii. p. 91). Judging from the exterior alone, there could thus be hardly room for doubt that the building is the same that was seen in the seventh century. The interior structure, as it is, consists of a cell of oblong rectangular form (20 feet 4 inches by 13 feet), covered, at 22 feet from the floor, with a pointed vault. Above this is another chamber, also oblong, and similarly vaulted at about an equal height. And such doubt as has arisen regarding the identity of the present building with that seen by Hwen Thsang has been suggested by these vaults; for it has been a generally accepted doctrine that the Hindus were ignorant of the true arch, or at least never used it; their openings, where a lintel was not employed, being formed by the *horizontal* arch, in which each layer of brick or stone is stepped or corbelled out until the narrowed space can be spanned. This is exactly the same principle on which rivers in the Himálaya, when not exceeding forty or fifty yards in width, are bridged with logs of cedar. The treasury of Atreus at Mycenæ, and the cell of Maes-How in Orkney, are instances of this construction in stone; and it is in this way that the towers, corridors, and openings of old Hindu temples on the Continent, as well as those in Java, and in Camboja, are closed in. It is thus that the doorways of the Kutb Minár at Delhi, and the splendid arches of the adjoining mosque, and great tomb of Alá-uddín, are formed. In these latter cases we find the Hindu artisan carrying out the orders, perhaps the design, of the Mahommedan Lord, who could at least rudely sketch the form of the openings he desired, though he could not teach constructive detail.

Now it is very remarkable that the arches of the Buddh-Gayá Temple are of a very peculiar kind (which we shall presently explain), and that kind the same that is so extensively used in the great mediæval structures at Pagán on the Irawadi; whilst it is also an historical fact, known from an inscription still existing on the spot, that the Buddh-Gayá Temple was in some measure, large or small, restored or repaired by a mission from one of the Burmese kingdoms (apparently Arakan), in the year 1305-6. Putting these two facts together, it is not wonderful that the belief should have been adopted by Mr. Fergusson and others that the "restoration" accomplished by the Burmese in the fourteenth century went far towards reconstruction, and included the building of the vaulted cells. It may be added that the three-storied arrangement of cell above cell, though most unusual in Indian shrines of any kind, has exact parallels among the great brick temples on the Irawadi. In 1865 Mr. Fergusson, in a letter printed by the Asiatic Society of Bengal, expressed his opinion thus:—

> I see no reason to doubt the evidence of the inscription that the building was erected in the first years of the fourteenth century. From its architecture. . . . I should have been inclined to make it even more modern; and the evidence of the arches . . . . is to my mind conclusive that it was erected long after the Mahomedan conquest. Had it been built by true Hindoos they would not have been found there even then; but the Burmese never hated the arch so cordially as the true Hindoo. . . . I feel nearly quite certain that the arches were inserted and the tower took its present form in the beginning of the fourteenth century.

We may observe in passing that the penultimate remark about the Burmese, so far as it applies to their mediæval buildings (and practically now they never build except in timber), would be fairly paralleled by another apophthegm which (*pace tanti viri*) we will hazard here—namely, that the Dutchman never hated sausages like the true Osmanli Turk. Mr. Fergusson is not one apt to change his opinions. But so strong have, we apprehend, been the arguments urged by General Cunningham on this subject (*Archæological Reports*, vol. iii.), that in the last form of the Oriental portion of his great work (*The History of Indian and Eastern Architecture*, 1876), Mr. Fergusson's views show evident modification. His latest utterance will be found at p. 70 of that work. It intimates in effect that the substantial identity of the existing structure with that of the seventh century may be accepted, but that the arches are mediæval additions by the Burmese.

The peculiarity of these arches is this; that the bricks, instead of lying flat face to flat face, with the arch joints parallel to the abutment, are laid edge to edge, with the arch joints at right angles to the abutment. In fact, they are exactly like the segments of those flat circular or annular cakes, cut by lines radiating from the centre, that we see in a confectioner's window. This peculiar arch is also that used in all the great vaults or "caves," as the Burmese call them, of the temples at Pagán, though in the minor openings of those buildings arches of ordinary European structure (*i.e.* with the bricks laid face to face), whether pointed, cusped, triangular, or even perfectly flat, are common. When these peculiar arches were first described in the narrative of Major Phayre's Mission to Ava in 1855, they were not known to exist in India; but the identity of the arches at Buddh-Gayá was recognized by General Cunningham and others some years later, and naturally the first impression was that they had been introduced by the Burmese restorers of 1305-6. From a further study of the building, however, General Cunningham has arrived at a conviction that the internal arching, though not part of the original construction, is of a date prior to Hwen Thsang's visit, and he finds this addition to elucidate a story which that worthy relates. This story tells how the pious Minister of an heretical king, who tried to destroy the Bodhi-tree, was ordered by his master to remove the Buddha image and substitute an emblem of Mahadeo. The Minister tried "to make the best of both worlds" by building a screen-wall before the Buddha, and setting up the Mahadeo in front of it. Assuming that the cell was originally square (as it assuredly was), the screen-wall would destroy its symmetry; and General Cunningham conceives that the vault and its abutment walls were introduced at this time, reducing, as they would, the deformed cell again to quadrilateral symmetry. This ingenious argument certainly goes very near carrying conviction. Dr. Rajendra, who supports it strongly, cites another ancient temple at Kunch in the same district, where there has also been an evidently subsequent introduction of a vaulted lining to the cell. It is true that, as he says, there is here no reason to suspect Burmese intervention. Still it is to be noted that at Kunch, as at

Buddh-Gayá, the corbelled construction belongs to the original edifice, the radiated arch is the later addition. And we can hardly suppose that here also was enacted the little drama of the heretic king and the Buddhist Minister. So that altogether the evidence of the Kunch temple is by no means decisive.

Demonstration, however, of the antiquity of the arch in India has recently been found. In vol. viii. of the *Archæological Reports of India*, Mr. Beglar, one of General Cunningham's assistants, describes his exploration of an ancient site at Nongarh, a place adjoining the East Indian Railway in Behar. The result of the excavation was to show that a small temple had existed on the site; that in course of time this temple fell in ruins, and became a low mound; that subsequently over this mound a *stúpa* was built. From the fragment of an image bearing an inscription the temple is assigned with probability to the age of the Christian era. In any case Mr. Beglar found that this temple, ruined, and buried, and piled with rubbish over which a Buddhist tope had been built, had been vaulted with bricks set edge to edge, in the fashion of the Burmese temples, and of those of Kunch and Buddh-Gayá. This discovery seems to prove beyond question that, however limited was the use of the true arch by the Hindus, they did know it some two thousand years ago in this peculiar form, and occasionally used it. We gather also that this form of construction was carried from India by the architects, whoever they were, of those wonderful structures at Pagán. We suspect that the origin of this kind of arch was entirely independent of any Western influences. It is precisely similar to the structure of very ancient wells in Upper India. In these we often find the steyning to be formed of large flat bricks or tiles, moulded so as to radiate from the centre of the well when laid in their annular bed. The brick arch of the Behar temples looks like a direct transfer of this construction from the well, where it was intended to resist horizontal pressure, to the vault, where it resists vertical pressure.

We have spoken of repairs by the Burmese in 1305–6. The character of these seems to have been exactly such as their countrymen have applied to the great temples on the Irawadi; and the accounts we have of the latter illustrate aptly the deterioration which formerly made Mr. Fergusson hesitate to recognize, in the existing tower of Buddh-Gayá, a relic even of the splendours described by Hwen Thsang. In the *Mission to Ava* (p. 44) we read of the Pagán temples:—

> It is only from the study and comparison of the remains of the unrepaired and unbarbarized temples that their full intention and true character can be made out. Every main cornice, for instance, is crowned with a sort of battlemented parapet, assuming in the repaired buildings a coarse incongruous appearance in rude plaster-work. In the temples which remain in their original state . . . . we find these battlements to be but the settings of embossed and glazed, and sometimes richly-coloured, tiles, which in fact must have formed a brilliant "polychromatic" coronet to each successive terrace of the temple. In the basement mouldings . . . . the upper limb is an ogee carved in bold foliation of truly classical character. This, in the restorations and beautifications, has been . . . . degraded into an idiotic and misplaced repetition of the battlemented crown of the cornice.

And so on. Compare this with Dr. Rajendra's observations at Buddh-Gayá, where the material is precisely the same, *i.e.* brick-work of an extraordinarily fine kind, but set only in *clay* and coated with plaster:—

> The plastering shows that the mouldings had undergone at least three successive repairs. . . . The repairers were in every case less efficient than those who built the temple. . . . Most of the finer stucco mouldings have been covered over—fine, bold, clear scrolls and forms, which with the first touch of the repairer became coarse and rude, and subsequently entirely hidden, changing well-formed, ribbed-melon capitals into misshapen round balls, and floral bases into plain toruses (pp. 86–87).

Whatever mischief may have been done by the Burmese of the fourteenth century, possibly their labours helped to preserve so much of the old temple as has survived to our day. Unfortunately no such apology can attach to renewed efforts of like kind made recently:—

> Certain Burmese gentlemen [writes Dr. Rajendra], deputed by H.M. the King of Burma, arrived at Buddh-Gayá at the beginning of 1877, and with the sanction of the Mahant [*i.e.* the Abbot of the adjoining convent], who is the present owner of the temple . . . carried on demolitions and excavations . . . which in a manner swept away most of the landmarks. The remains of the vaulted gateway . . . had been completely demolished . . . the stone pavilion over the Buddhapad [foot-mark] had been dismantled . . . the granite plinth beside it had been removed . . . the sites of the chambers brought to light by Major Mead had been cleared out. The drain-pipe and gargoyle which marked the level of the granite pavement had been destroyed. The foundations of the old buildings noticed by Hiouen Thsang around the Great Temple had been excavated for bricks, and filled up with rubbish. The revetment wall round the sacred Bodhi-tree had been rebuilt on a different foundation. The plaster ornaments on the interior face of the sanctuary had been knocked off and covered with a coat of plain stucco . . . The Burmese gentlemen were doubtless very pious and enthusiastic in the cause of their religion, but they were working on no systematic or traditional plan. They were ignorant of the true history of their faith, and perfectly innocent of all knowledge of architecture, and the requirements of archæology and history; and the mischief they have done by their misdirected zeal has been serious.—p. 66.

Some fanciful traveller has called the capital of the Siamese the Eastern Venice; but, with the late proceedings at St. Mark's fresh in memory, this recital might tempt a malignant suggestion that that title belongs of right to the Burmese. If these "Burmese gentlemen" had indeed "no traditional plan," they had at least a traditional model; it was that of the bull in a china-shop. But was all this perpetrated before any rumour of it could travel fifteen miles to the head-quarters of the district? Or was the collector an archæologic Gallio who cared for none of these things? The fact is that at present such risks are left to chance or the caprice of the civil authority. It is needful that law should make it as binding on the civil authorities of an Indian district to prevent the destruction of history as to protect property. It was understood last year that Lord Lytton had such a bill *in petto*. We trust he will not delay its introduction. When the line of railway to Candahar is laid, the lines of our future Afghan policy must be pretty well laid also; but much experience shows that it is just in such matters as this of archæology (*i.e.* of the protection of historical records), that all depends on the ruler's feeling an exceptional interest in the subject. Lord Lytton does feel that interest; his successor may be indifferent. Mr. Sherring, in his *History of Benares*, tells us that the remains at Sárnáth, where the fragment of a magnificent *stúpa* still commemorates the spot where Sákya began to "turn the Wheel of the Law," have contributed many cartloads of sculptured and other stones to the building of two bridges. A rock at the mouth of Singapore river, inscribed with ancient Indian characters, and well known as an object of historical interest ever since Raffles laid the foundation of the modern town, was blown up, some thirty or forty years ago, in defiance of remonstrance, because it stood in the way of some trumpery bungalow. And Mr. Rivett Carnac last year brought to notice the growing danger to all ancient remains from the very fact of the spread of a kind of antiquarian taste, and the opening of the tourist market for curiosities. Nothing will meet these dangers, as well as the older and more brutal kinds of vandalism, but law.

Dr. Rajendra's book contains many other points of interest, intelligently discussed or touched on. It has been published by order of the Government of Bengal, and apparently owes its origin to the Burmese freaks of which we have spoken. That Government, on hearing of those proceedings, sent Dr. Rajendra to the spot to watch and advise, but apparently too late for any good purpose. Having made his official report, he found himself in possession of a good deal of material which he thought it well to utilize in a monograph on the subject. After noticing the labours of his predecessors on this field, he writes:—

> Coming . . . after so many distinguished inquirers, I could only hope to glean where they had reaped the harvest. In the following pages I have, therefore, attempted to follow their footsteps, to elucidate questions left doubtful by them, to elaborate where they are brief, to fill up *lacunæ*, and to summarize all that is worth knowing of a locality which occupies a most important position in the religious history of India.

As regards much of the scope thus indicated, Dr. Rajendra has done good service, and we can cordially praise him, though we could hardly regard the book with complacency as the result of a Government archæological survey of one of the most famous sites in India, or as the original work of a European archæologist. In the matter of illustration there is much in this handsome volume that is open to criticism. No one of the numerous plates gives a just idea of the general impression of this majestic temple. For that we must go to Mr. Fergusson's work (see the admirable cut at p. 70). There is no attempt to give a much-needed section of the temple, or to elucidate graphically the remains of the pavilion spoken of by Hwen Thsang. In his attempt to compile restorations of the tower and its porch, Dr. Rajendra went *ultra crepidam*, and the latter attempt is indeed ridiculous. It is curious, we may remark in passing, that among the great remains of Pagán there is a temple called the *Bodhi*, dating from about A.D. 1200, which was evidently intended as a reproduction of the shrine at Buddh-Gayá. A photograph of this exists in Colonel Tripe's collection in the India Office Library. We must dwell for a moment, however reluctantly, on the defective character of Dr. Rajendra's attempts in this way, because rumours have reached us of some intention on the part of the Bengal Government to "restore" the structure. This is a wild idea. What they may well do is to spend money in exploring thoroughly the mass of rubbish which still encompasses the temple; to procure, by aid of special scaffoldings, accurate measurements, drawings, and large-scale photographs of the facts of the architecture as they are; and to see that the building has every fair chance given it to live out its natural life. But any attempt at the *restoration* of such a structure is absurd; and the only possible repair will hardly commend itself, for it would necessarily be in the Burmese fashion—namely, a new coat of plaster.

Dr. Rajendra in his natural character as a Sanskrit scholar speaks with more mastery of his subject. And his remarks in condemnation of the inscription regarding the origin of the Buddh-Gayá Temple, which was published by Sir C. Wilkins in vol. i. of the *Asiatic Researches*, are weighty. It is impossible, we should think, after reading them to regard that inscription as anything but a modern figment, a conclusion to which Buchanan Hamilton, no pundit but a shrewd observer, came long ago, though the document has since been treated as if it were a genuine record.

SCHIERN'S LIFE OF BOTHWELL.*

ALTHOUGH bearing the name of the Earl of Bothwell, this work may fairly be reckoned as adding one more to the long list of volumes which the misfortunes of the unhappy princess whose connexion with the Earl wrought so much woe have called

---

* *Life of James Hepburn, Earl of Bothwell.* By Frederick Schiern, Professor of History in the University of Copenhagen. Translated from the Danish by the Rev. David Berry, F.S.A. Scot. Edinburgh: David Douglas. 1880.

into being. Nearly two-thirds of the book have been got through, before Mary Stuart disappears from its pages, and Bothwell is left to thread his way as best he can through the maze of troubles that he has spread for himself. This was perhaps unavoidable, as the fortunes of the two were so closely intertwined that to explain the nature of Bothwell's position in Scotland at the time when he left it, it was necessary to take a retrospective view of the events which had happened in the kingdom for the years immediately preceding that date. In so doing Professor Schiern has made himself thoroughly familiar with the authorities on both sides, and has been struck, as every student of the history of those times must be struck, by the very contradictory nature of the evidence produced by these authorities. Truly, one is driven to the conclusion that either all persons who wrote in those days had a wonderful gift of lying, or else that some of the witchcraft they were so fond of talking about had really affected them. For there is hardly one circumstance connected with Mary Stuart but is told in a different way, according as the teller of it is her partisan or her accuser. To neither of these classes can Professor Schiern be said to belong absolutely, though he certainly leans more to the side of the Queen's defenders, and evidently thinks that the "Casket Letters" were spurious. While hesitating to cast upon the Queen any of the guilt of Darnley's murder, this author cannot, in the face of facts, acquit her of having had any secret understanding with Bothwell before the day when he carried her off, apparently against her will, to Dunbar. He thinks that "a middle way seems still capable of being found, which may come nearer the truth." As, however, Professor Schiern has not yet found out that Mary did not marry Bothwell, and as he cannot gainsay the fact that she advanced him to the highest honours in the kingdom when the voice of the people was denouncing him as the King's murderer, such a "middle way" seems as far from being got at as ever. The story of Mary Stuart's fortunes and misfortunes has been so often told that it is needless to enter in detail into all that Professor Schiern has to say about it. The real interest of his book lies in the information which it contains about the life of Bothwell after the surrender at Carberry. From that day this man, who had been the prominent figure in all Scottish affairs, and whose position was as well secured as the favour of the Sovereign, the bond of the lords, and an armed following of four thousand men could make it, disappears from the scene, and his name is heard no more, save in the denunciations launched against him as a murderer, an outlaw, and a pirate, whom all friends of Scotland were entreated to deliver up to justice. Like the poor woman in whose ruin he had had so large a share, Bothwell was doomed to pass the last years of his wild and stormy life in close imprisonment in a remote corner of a foreign land. There he died forgotten and unmourned even by his nearest kindred. So utterly was he lost sight of by his contemporaries that he was believed to be dead while he was still lingering in prison, and that they did not even know the name of the castle in which he was confined. The only trustworthy information concerning the latter period of his life must be sought from Scandinavian sources. The existence of documents throwing light upon the history of Bothwell was first brought into notice by the Danish historian Suhm, at the close of the last century. The MS. which he found in the Royal Library of Stockholm, together with other contributions to the subject from the Danish State Archives, was printed for the Bannatyne Club in 1829; but, owing to the limited number of copies printed, this book is now so scarce as to be hardly obtainable. These documents, together with every other scrap of written or printed matter in any way connected with his subject, Professor Schiern has carefully examined and compared. His book is therefore not only well written and interesting, but, at the same time, is so thoroughly trustworthy that it can well bear the test of close critical examination. He has succeeded in making his story both clear and connected—no easy task, seeing that the same fatality which prevented any two people seeing the doings of Mary Stuart in the same light seems to have touched the history of Bothwell too. In Scotland it was commonly believed that when he left Dunbar he took to the high seas as a pirate until he was captured in battle by the Danes. And Professor Schiern mentions that but a few years ago a picture was exhibited in the Danish Academy representing the action in which he was taken. That battle, it seems, never took place, and is merely one of the many myths connected with the name of this notorious noble.

The true story of his adventures, as we gather it from Professor Schiern's pages, is briefly this. After leaving the field of Carberry he rode straight to Dunbar, and thence put to sea with two vessels and made for Spynie Castle, which was in possession of his uncle, Bishop Hepburn, of Moray. From Spynie he sailed for his own dukedom of the Orkneys. But, as the keeper of Kirkwall Castle showed himself unfriendly, the Earl stayed there but two days and passed on to Shetland. There he hired two more vessels from German merchants, and with these he made for Bressay Sound, hoping that, as the stormy season had already begun, he might be able to pass the winter there unmolested. Suddenly the Scotch and English cruisers that were sent in pursuit of him appeared in the Sound. Bothwell's ships slipped their cables and got out to sea, passing safely over a rock on which one of their pursuers struck. But the enemy followed close, and off the coast a battle was fought, and one of Bothwell's ships was taken. Thanks to a strong south-west wind, he himself, with two of his vessels, got off into the North Sea. But the gale that had stood him in good stead up to this point now went a little too far, and carried him on to the coast of Norway. Here he fell in with a Hanse ship, which piloted his ships into Karm Sound. While they were there, a Danish war-ship, under the command of the famous Captain Christian Aalborg, came to Karm; and, when he found that these strangers were without commissions, sea-briefs, or passports, he made up his mind to take them to Bergen. As they were a numerous company, to effect this required some generalship. Aalborg got eighty of Bothwell's men on board his own ship on pretence of supplying them with provisions, put some of his own crew in their places, and summoned the peasants of the neighbourhood to assist him in taking these pirates before he let his intention be known to the pirates themselves. Then, to Aalborg's surprise, Bothwell, who had hitherto kept in the background, came forward, and introduced himself as the King of Scotland. As he was dressed in an old boatswain's suit, all his clothes having been left behind in one of his ships in Shetland, Aalborg did not believe the story, and made the whole party come with him to Bergen. He then reported the pretensions of his prisoner to the Governor of the Castle, who called together the chief people in Bergen and came on board to inquire into the case. He asked Bothwell for his passport, to which he haughtily replied that, as he was the chief ruler in his own land, he could get a passport from no one higher than himself. Still the Governor was not satisfied, but thought that if Bothwell were such an exalted personage he must have some very suspicious reasons for travelling in such guise. The upshot of the inquiry was that Bothwell was told he must remain at Bergen till the King's pleasure was known. He was in nowise under restraint, but lived at his own charges in an inn in the town, and was treated as a person of distinction by the Governor and the chief people of the place. It would have been better for the Earl in the end if he had kept more in the background, for he met in society a lady who claimed to be his first, and therefore only lawful, wife. She summoned him before the Court, and told how long years before he had decoyed her away from her home and country, read in his presence the letters in which he had promised to marry her, and denounced him for his faithlessness in having married two other wives, to wit, Lady Jane Gordon, and finally the Scottish Queen. This was certainly rather an unpleasant way of establishing his identity, and to appease the indignant lady Bothwell had to promise her an annuity from Scotland, and to hand over to her the smaller of his two ships. His captain, too, was seized, and put in prison for previously committed piracy, and though the offence he was charged with was prior to his entering into Bothwell's service, still it clearly told strongly against him in the public mind. For we presently find him asking to be allowed a small boat, that he may row along the coast to Copenhagen. The reason he gives for this request is that he suffers much from sea-sickness on the open sea, though to hear the Lord High Admiral of Scotland confessing such a weakness is as startling as the ignorance of geography which his request betrays. The permission he asked was refused, and at last, after having been a month in Bergen, he left it in the custody of Aalborg on the last day of September for Copenhagen. When he reached that city, he was confined in the castle until the pleasure of the King, who was in Jutland, should be known about "the Scottish King," as they called him. Here he remained three months, and during that time his enemies, who had now the upper hand in Scotland, wrote to Frederick, demanding that he should be given up to them to receive the due reward of his many crimes, or that he should be beheaded in Denmark, and his head sent over to be exhibited where those crimes had been committed. At the same time Bothwell wrote to the King, explaining the circumstances which had led to his arrival in Denmark, declaring himself the real Regent of Scotland, denouncing his opponents, the lords, as rebels, and asking Frederick's help to put them down. Frederick complied with neither petition; he kept Bothwell as a State prisoner, and in January of the following year, 1568, he was sent across the Sound to Malmo Castle in Scania. Here he was still allowed some measure of liberty; he received visitors, and had silk and velvet clothes given him by the King, so that he might make an appearance suited to his rank. But in June 1573 he was suddenly taken from Malmo to the more solitary and out-of-the-way fortress of Dragsholm, in Zealand, where he was kept in close and rigorous confinement till his death, which took place in April 1578. No satisfactory reason has yet been produced to account for this sudden change in the treatment of the captive Earl. Reports of his death were spread from time to time. It was also commonly believed that he went mad some time before he died, but of this there is no conclusive evidence. He had been dead to the outside world since the day when the gates of Dragsholm shut upon him, and when his life actually ended no one heard of it outside the walls. He was buried in the lonely churchyard of the nearest village.

As for the so-called "Testament" of Bothwell, in which he is said to have made a death-bed confession exonerating Mary from any share in his crimes or complicity in his plots, Professor Schiern considers it to have been a forgery got up by the Queen's party as a counterpoise for the famous "Casket Letters." He draws attention to the fact that, as the Earl lived five years after he left Malmo, this confession, which purports to have been made there, was certainly not a deathbed confession, for two of the witnesses, whose names were appended to it, had died in the early years of Bothwell's sojourn in Denmark; also that no original of the document has ever been produced. Copies of an abstract of its contents were handed about among those most interested in the transactions it referred to. One of these

abstracts formed the first article in the accusation of Morton. There are also two MSS. of the same document in the University Library in Edinburgh, and one of them, now printed for the first time, is added by the translator in a note. As a still stronger argument against the genuine character of this "testament," Professor Schiern lays great stress on the fact that James VI., when he went to Denmark to bring home his bride, though he showed himself so eager for information upon every possible subject as to excite the surprise of the Danes, made not the slightest effort to clear up the doubts which existed about this "testament." Now, as the sons of the very men who were supposed to have witnessed it were much with him in Denmark, and returned with him to Scotland, he had every opportunity for establishing its authenticity. And as he was naturally anxious to clear his mother's memory, and could not have forgotten the impression which the document made upon himself when he first heard it read, there is no reason to doubt that he would have done so if he could.

With the account of the chivalrous expedition of James to Denmark Professor Schiern brings his book to a close. The translator deserves the thanks of all those who are interested in the history of the period of which Professor Schiern treats for having placed his work within reach of English readers. Danish is so little known among us that the very existence of this Life of Bothwell has been hitherto unknown save to a few students of history. The difficult work of translation has been exceptionally well done. While the style is clear and easy it yet retains the vigour of the original, and here and there the translator has added notes for the further elucidation of the text.

CHINESE STORIES.*

THE Chinese have had to pay one penalty at least for their early knowledge of printing and their universal system of education. The wandering storyteller who delights the idlers in the bazaars of Cairo or Damascus, or who stirs up the passions of his Bedouin hearers amid the sands of the desert, or who entrances swarthy audiences in the cool of the evening on the outskirts of an Indian village, is unknown in China. The ready eloquence, the impromptu jest, the varied tones of those professional worthies who find a ready welcome in every house or tent from Cairo to Calcutta, are exchanged in China for unyielding types on the printed page. But "what the eye hath not seen the heart doth not grieve after," and Chinamen who have known no other storytellers than their books have no desire to become acquainted with the fairies, gods, and demons of their lands through any other channel than these. We have no present intention of tracing the gradual development of Chinese mythology from the original conception of the male and female principles of nature to the universal belief in the gods and goddesses, fairies and sprites, which personify the lights of heaven and the wonders of the earth, and which haunt every nook and corner of the land, from the loftiest mountain down to the smallest stream. That "millions of spiritual beings walk the earth" is a belief endorsed by Confucius, and let the superstitious rites which have been observed by myriads of his followers testify to their full concurrence in his views. Chinamen are still in the full enjoyment of the simple privileges pertaining to that pre-scientific stage of thought when every unusual phenomenon is attributed to the direct agency of some supernatural being. If the floods descend, it is that the dragon is spouting out water over the land; if a pestilence breaks out, it is that the local deities are offended; if sudden death overtakes any one, it is that some demon has sucked his life-breath from his nostrils. And so we find that in every unlooked-for event in the life of the nation or of the individual the sprites bear their part. They attend at the birth of the infant, and they follow the corpse to the tomb, and so interweave the threads of their being with the web of human existence that they form part and parcel of the every-day life of the people.

Thus there are ample materials ready to hand for the creation of every variety of fairy tale and ghost story. But though writers without number have sought to embalm the superstition and reflect the fancy of bygone ages, they have failed, as Chinese storytellers must always fail, to present them in such a shape as to make them generally attractive. They contain, without question, a vast amount of extremely interesting information on the habits of thought and life of the people; but the imagination of Chinamen is too untrained and disjointed to enable them to weave a consistent story. It calls up isolated pictures, but fails to connect them into a well-sustained narrative. It works without design, and runs riot as in a dream. Some of the earlier stories to be found in the works of the Han Dynasty, and borrowed from India, are as good as anything of the kind to be found in Europe; but of the later stories there is little more to be said than that they are curious.

Of all the collections of modern stories, however, the one from which Mr. Giles has chosen to make his selections is undoubtedly the best. The stories are above the average of similar compositions; and the literary style is of so exceptional a purity that it has won for the compilation a high place in the estimation of educated Chinamen. The entire work consists of three hundred and eighty-five stories, and of these Mr. Giles has translated one hundred and sixty-four in the volumes before us. The author, who wrote towards the close of the seventeenth century, has been fortunate in his translator. Every advantage which an easy flowing style can give has been reaped by P'u Sungling in Mr. Giles's pages. His rendering also of the text is, as a rule, literally accurate. In a few instances, in the exercise of a wise discretion he has toned down certain passages to make them presentable to European readers, as, for example, the "love" scene in the story of "Baby" Ning, or, as Mr. Giles, leaving the first character untranslated, prefers to call her, Miss Ying-ning. In the original this passage is quite untranslatable, and we should have left unnoticed the fact of Mr. Giles's having paraphrased it—though he has allowed himself a wide license in doing so—were it not that he uses his very loose paraphrase to support a theory which the original contradicts. The story runs that one day a young gentleman named Wang was walking in the neighbourhood of the village in which he lived, when he met on the road a pretty girl who was picking plum-blossoms. Abashed by the fixed gaze with which Wang eyed her, the young lady dropped the flower she held in her hand and walked away. Wang picked up the discarded flower, and "stood there disconsolate as if he had lost his wits." He returned home, but could neither "talk nor eat," and before long took to his bed, where he lay ill and delirious. By a curious set of circumstances, such as are only to be found in a Chinese story, Wang finds himself a few weeks later a guest in the house of the young lady's adopted mother, who turns out to be his cousin. After a formal introduction to the young lady, he meets her in the garden of the house, where at his first interview with her occurs the scene which Mr. Giles considers "should for ever disabuse people of the notion that there is no such thing as 'making love' among the Chinese." Mr. Giles tells us in his preface that he began the translation of these stories in 1877, and it is possible, therefore, that he added a note to his paraphrase after the recollection of the original passage had faded from his mind. On meeting Baby Ning in the garden, Wang of course produces his cherished flower from his sleeve and tries to explain to her that it was out of affection to her that he had kept it. She replies, somewhat illogically since he had only just discovered his relationship to her, that it could have been merely out of regard for her as a cousin, and then, according to Mr. Giles, Wang says, "I wasn't talking about ordinary relations, but about husbands and wives." "What's the difference?" asked Ying Ning. "Why," replied Wang, "husband and wife are always together." "Just what I should not like," cried she, "to be always with anybody." And then follows the note which begins as above.

Now the fact is that, in the original, the language employed by Wang far more nearly resembles that used by the Elders to Susannah than that to be expected from a lover in an English sense. And this just marks the contrast between love among the Chinese and among Western nations. With Chinamen it is a delirium, a rapture, based on no regard for the moral qualities of the objects of their admiration, but purely and simply on a desire to possess them. They do not understand the idea of friendship in love, and the notion of an acquaintanceship ripening into affection is altogether foreign to them. If a young Chinaman falls in love, it must needs be after the manner of Wang, who is so enraptured with the beauty of a young lady he casually meets on the road that he goes home and takes to his bed, and is restored to health only by an introduction to the fair one, whom at his first interview he addresses in language which is quite untranslatable into English. Of course we do not mean to say that it never happens that young people in the poorer ranks of life (for it is only among such that pre-nuptial acquaintanceships are generally permitted) entertain a genuine affection for each other; but, speaking broadly, love among suitors is unknown in China, and the constitution of society makes it impossible that it should be otherwise.

The majority of the tales told by Mr. Giles are Fox stories such as are to be met with in the folk-lore of Japan and of other countries. In most cases the foxes take the form of young ladies, who are sometimes evilly disposed and sometimes mischievous, but always beautiful, and who occasionally are represented as fulfilling the duties of wives and mothers without in any way betraying their uncanny nature, until, at the end of the story, they disappear, or are transformed into some monstrous shape. Another common fancy is that the ghosts of deceased men re-enter their former bodies and resume their worldly occupations in distant parts of the Empire. In the story of "The Faithless Widow" there is an instance of this. A man named Niu dies leaving a wife and family. Being in straitened circumstances the widow marries again, and hands over her children to the care of an aunt. Years afterwards one of the sons recognizes his father Niu in the person of a pawnbroker with whom he has taken service. The pawnbroker acknowledges the relationship and introduces his son to a stepmother. Being made desirous of visiting his old home by this revival of former associations, Niu starts on his journey thither, when suddenly he reappears leading by the ear his first wife whom, after roundly abusing for deserting his children, he bites across the neck. The son rushes to the rescue of his mother, when lo! she disappears, and Niu vanishes away in a black vapour. On returning to his native place the son finds that his mother died on the very day and hour when he had witnessed her disappearance. There is a want of point in this and a great many of the stories; but there is much that is amusing in them, and the constant references they contain to the manners and customs of the people give them more than a passing interest.

* *Strange Stories from a Chinese Studio.* Translated and Annotated by Herbert A. Giles. 2 vols. London: De La Rue & Co. 1880.

Some of Mr. Giles's notes help to elucidate, while others tend rather to confuse the reader. In his note on the Dragon boat festival, he seems to be in strange perplexity as to the name of the well-known statesman in whose honour it is annually held. The story runs that during the reign of Prince Hwai (B.C. 314), a certain "Chancellor of the three Royal clans" (San lü tai fu), named K'ü Yuan, having been unjustly denounced by a jealous rival and dismissed by his sovereign, gave vent to his despair in a poem entitled "Li sao; or, the Dissipation of Grief," and then drowned himself. In honour of his memory a festival is held in the South of China on each anniversary of his death, at which Dragon-shaped boats are rowed up and down the rivers to commemorate the efforts made to recover his body. This story is told in the history of the period (Shi ki), in the biographical dictionaries, and in the introductions to certainly most of the editions of K'ü Yuan's poem, the "Li sao"; yet Mr. Giles appears to be in doubt on the subject. In the note referred to he is perplexed whether to follow Mr. Wells Williams, who in his *Middle Kingdom* speaks of the statesman as Wu Yun, or Mr. Mayers, who gives the name correctly. But still another difficulty overtakes him. In the Chinese author's preface K'ü Yuan is spoken of as *San lü she*, or Chancellor of the three Royal clans. Mr. Giles mistakes this description of his office for his name, and adds in a footnote in this place that San Lü was the hero of the Dragon festival. Thus a third doubt arises in his mind, and K'ü Yuan becomes, like Mrs. Malaprop's Cerberus, "three gentlemen at once." But, after all, neither the identity of a statesman nor Mr. Giles's heretical views on Chinese love-making and other social subjects are likely to affect the ready reception his present work is sure to meet with. These are subjects entirely apart from P'u Sung-ling's stories, and there are many people to whom an introduction to Chinese folklore through the medium of Mr. Giles's facile translation will be a source of pleasurable interest and amusement.

OUR BURMESE WARS.*

THIS book reminds us of *Nicholas Nickleby* and of Mr. Wititterly's opinion of his wife. "She forms and expresses an immense variety of opinions on an immense variety of subjects. If some people in public life were acquainted with Mrs. Wititterly's real opinion of them they would not hold their heads, perhaps, quite as high as they do." Though Colonel Laurie does not make a profession of omniscience, he manages to cover a large extent of ground and to quote from "an immense variety" of authors. His readings, like those proposed by Dr. Pangloss for his pupil Dick Dowlas, seem to have been "various." Indeed, there is no end to the authors whose sayings he brings in. He has that peculiar sort of memory which, when a subject has been disposed of, is always suggesting to him some further illustration or some remote analogy. His pages teem with notes, a few of which are apposite, others are not wanted at all, and others again might with advantage have been incorporated into the text. Quotations master the narrative, but unluckily the references are not always given. In one place "a highly intelligent officer" writes about the vast importance to us of Upper Burma. In another, "one of our best public writers" holds some mysterious doctrine about the "lucubrations" of the *Golos*. Another "authority" sees a full payment of all expenses in the teak forests, the fertile soil, and the noble rivers of Pegu. There are constant appeals to the author's own works and to previous writers on Burma, and it is not always easy to follow this sort of literary Proteus. While extracts abound, illustrations and comparisons and suggestions are still more abundant and bewildering. The author of *Peter Simple* served in the first Burmese war, and it is suggested that the sight of one of the few war steamers then in existence doubtless drew forth many a witty remark from the "Sea Fielding." Marryat's *forte*, we may observe, was humour, and not wit. When Scindia, in 1827, lent half a million to the Government of Lord Amherst, he must, we are reminded, have been influenced by an aphorism of Bacon's about lending moneys "far off, or putting them into unknown hands." Archdeacon Paley is quoted for the justification of particular wars. A stockade is set on fire, and immediately the "quiet landscape is disturbed with the fierce and raging element." The sun does not rise in Pegu or Burma, but, in its place, we behold "Surya ascending in full splendour, as if seeking a vantage-point to view the coming fray." After this it is to be expected that H.M.'s brig *The Serpent* becomes the "wily one," and impresses you with the belief that she is brooding over mischief. A schedule of ordnance captured from the Burmese at Rangoon in April, 1852, carries this discursive writer off to Patrick Miller, of Dalswinton, who invented carronades and named them from a place called Carron. The sight of the P. and O. steamer *Oriental* reminds Colonel Laurie that this vessel had once the honour of carrying the author of *The Crescent and the Cross*, and that Wilkie, who is "the Scottish Teniers," died on board the same vessel. Ophelia is mysteriously associated with the Buddhist doctrine of Nirvan or final absorption into the Deity. We might get rid of war altogether, it is suggested, not by the wordy speeches of Peace Societies, but if our life would only cease to be what Byron termed it, "a false nature." If Pondicherry is the "Niobe of the French possessions" in India, we wonder what classical figures ought to be applied to Chandernagore, Karikal, and Mahé. Are they her children? for, if so, to make the comparison apposite, they should have been blotted out of the map, or annexed to Bengal, Madras, and Bombay. But there is really no limit to Colonel Laurie's excursions into poetry and prose. Goldsmith's Chinese Philosopher; Machiavelli; Campbell, the author of the *Pleasures of Hope*, and Sir A. Campbell, who dictated the Treaty of Yandaboo; Benjamin Franklin, with his views on nursing, whistles, and the use of sunshine instead of candles; Southey's *Curse of Kehama*; Macduff weeping over his children; Hamlet's banter with Ophelia; speculation as to Buddha's identity; Spenser and "Jolly June"—these and a quantity of other authors and illustrations are successively pressed into service, even though, like Mrs. Malaprop's epithets, they might be thought to be a mile off. It is curious that with all this miscellaneous information Colonel Laurie omits to tell us that Admiral Austen, who died of cholera near Prome, in the second Burmese war, was a brother of Jane Austen, and that the French adventurer who, having been half over the world, ended by taking service with the Ruler of Ava, in reality bore the name of Rigodon, which he changed into D'Orgoni, as being more euphonious and aristocratic. We may add that *mozuffar* is not the same as *musafir*, "a traveller," but means "victorious."

As far as we can make out, one main purpose of the author is to prove that, as there have been two Burmese wars already, there ought necessarily to be a third; and that as we have annexed Arracan and Tenasserim in one campaign and Pegu in another, we might wind up affairs conclusively in that quarter by occupying the whole of Upper Burma. In support of this conclusion we have the usual speculations as to the intrinsic value and inexhaustible resources of this favoured tract. There are rubies and gold, to say nothing of baser metals, and the mines, if properly worked, would pay off half the national debt of India before the present century expires. Drugs and spices, gums and gamboge, redwood and sandal wood, are found in forests and by streams. Then we have the usual stock arguments about trade with Western China and the rich provinces of Yunan and Szechuen. In short, Upper Burma is not the "worthless rind" which it was rashly said to be by Lord Dalhousie, but a valuable increment which is substantially a part of Lower Burma and Pegu, and almost as good as "annexed" already.

The contrast between the first and second Burmese wars, though to be gathered from these pages, is nowhere drawn with a very clear and definite outline. At both periods the Burmese displayed their usual arrogance and absurdity, and there were the same characteristics of stockades, thick jungles, heat, damp, and liability to epidemics. But between the years 1824 and 1852 the Anglo-Indian Government had made marked advances in all that relates to the transport, commissariat, and comfortable housing of troops; and there was all the difference in the world between the two statesmen who, at each epoch, respectively presided over the Indian administration. The first Burmese war began with an unprovoked attack on the part of Burmese soldiers on our own possessions in an island to the south of Chittagong. We had to fit out an expedition to Rangoon, capture the place, sail up the Irrawaddy, and not halt until our troops were within forty-five miles of Ava. These operations lasted two years, and cost us more than ten millions of money. Meanwhile a large force remained stationary at Rangoon, and, like our army at Walcheren, suffered from dysentery and scurvy owing to unwholesome food and defective arrangements. On the frontiers of Bengal we entered Assam, drove out the Burmese, and retained that country. The results, at the chief seat of operations, were the annexation of Arracan and the Tenasserim provinces, which left untouched the intervening kingdom of Pegu. Rather more than a quarter of a century afterwards, the Government of India, which had narrowly escaped a war with Burma at the time of our Afghan disaster of 1841, had again to demand reparation for a series of injuries inflicted on our merchants by the local authorities at Rangoon, countenanced and supported by the King. It was remarked at the time that the best person to negotiate a difficult question with an arrogant Asiatic Court would have been an able and experienced Commissioner versed in the Burmese language, and not a gallant Admiral, about as fit for diplomacy as Hatchway or Commodore Trunnion. But, whatever doubts there may have been as to the origin of the war, there could be none as to the vigour and capacity with which it was brought to an issue. Lord Dalhousie at once hastened down to Calcutta, organized an expedition of military and naval forces, acted as his own War Minister, and finished the campaign in eight months at a cost of one million and a half. He then completed our seaboard by the annexation of Pegu and Lower Burma; and, while he commanded the whole waterway between the native capital and the sea, he also effectively disposed of any settlement by either the French or the Americans in the gap which had been left open in the earlier campaign.

Colonel Laurie's pages may serve to remind politicians of all shades who have been dragged into the whirlpool of Anglo-Indian discussion about treaties, frontiers, fringes of independent States, and possible occupations of military posts, that to this hour we hold Lower Burma and Pegu by the simple fact of our being there. The Secret Committee of the Court of Directors in 1852, acting under the injunctions of the President of the Board of Control, wished for a Treaty of Cession. Lord Dalhousie, with marvellous clearness of vision, insight into native character, and force of language, combated this view and held that a treaty

* *Our Burmese Wars and Relations with Burma; being an Abstract of Military and Political Operations* 1824-6—1852-3, *with various Statistical Information.* By Colonel W. F. B. Laurie, Author of "Rangoon" and "Pegu," Narratives of the Second Burmese War. London: Allen & Co. 1880.

was a thing to be avoided. It would give us, he argued, no greater hold on the country than what we had obtained by taking Prome, Bassein, and such frontier stations as Thyetmyo and Toungkoo. A treaty with such a ruler and nation only serves to multiply causes of scandal and offence; "points of contact, and consequently points of conflict." The British would be held down to observe every clause in the very strictest interpretation of both letter and spirit. The Burmese would quibble about the first and laugh at the second. So the country remains ours by simple right of annexation, and Colonel Laurie with both point and propriety, singles out for his title-page the Governor-General's prompt and celebrated reply to the Burmese Envoy who came to ask for the restitution of these possessions, that "the British flag should wave over them as long as the sun shone in the Heavens." These words delivered in the great Hall at Government House, Calcutta, were criticized at the time as somewhat theatrical. They were, in reality, admirably suited to the race for whose warning they were uttered. No serious retaliation has since ever been contemplated by the Burmese. During the Mutiny Burma was almost denuded of English troops. Even late revolutions, attended by all sorts of atrocities, have been confined to the Palace; and at any time the Chief Commissioner, on a word from the Viceroy, can stop the importation into the upper regions of the Irrawaddy of a detestable compound called *ngape*, as essential to the Burmese as beer to the Englishman, made up of fish only preserved from utter putrefaction by the admixture of sea salt. We do not think that Colonel Laurie's pages contain any reference to this condiment. In justice to the author we must allow that a good deal of second-hand information is to be gleaned from his pages; and that his narrative of the events of 1852, in which he took an active part, is spirited and correct. There was no very great or decisive action against foes protected by stockades, from which, when shelled out, they could find safety in the jungles. There was nothing to recall to us the capture of the Sikh batteries at Sobraon, or the complete route of the Khalsa at Goojerat. Towns and fortified places were taken one after another by the combined action of English and native troops on land, and by the *Fox* frigate and gun-boats and the war steamers of the now defunct Indian navy. There was also a lengthy episode of the pursuit of a celebrated leader named Myat-htoon, in which success was gained by Sir John Cheape against an enemy protected by dense forest, intimate knowledge of the country, and faithlessness on the part of our own native guides. Almost the only mishap of the campaign was the investment of Pegu by the enemy, when, after its capture, we had garrisoned it with too small a force. But this temporary check never caused anything like the anxiety called forth by the recent retirement into the Shirpur cantonments. The second Burmese war is a notable instance of a territory acquired in as short a space and at as small an expenditure as possible, and followed by complete pacification and an increase to the revenue surpassing Lord Dalhousie's anticipations. But then the country is fertile, the population easy to manage, and the climate equable though moist and hot. Moreover, Buddhists have nothing of the intolerance and fanaticism which characterizes Mohammedans in their rocky defiles. There is now a railway connecting Rangoon and Prome, a distance of 163 miles; but we are unable to comprehend how this line, which was only opened in May 1877, has already caused "an appreciable increase of population in the tracts through which it runs." What is meant, doubtless, is that stations on the railway have attracted the existing population, and have become centres or points of social and commercial activity. Rangoon itself is a city well laid out, on a noble river, within easy reach of the sea, possessing docks which are in course of improvement. The population of the town has rapidly increased, and the only drawback to a residence in Burma is that nearly all houses are built of wood, and that it has but a faint imitation of that charming division of the year known as the Indian cold weather. The province has been very fortunate in the officers who have filled the important post of Chief Commissioner. All have been men of good capacity, and some are men of real note. Sir A. Phayre, who was the first selection for the conquered province, has since been Governor of the Mauritius. The present Lieutenant-Governor of Bengal acted for some months as Chief Commissioner; and the administration is now in the hands of a clear-sighted and hard-headed Scotchman, who is thoroughly versed in the best traditions of the Calcutta Foreign Office. We trust that the great want of the whole province, population, may be slowly supplied, and that the abilities of which Colonel Laurie has certainly given proof may be devoted to writing about some other event than the one on which he seems resolutely determined—a third Burmese war, which is to end in the flight or dethronement of the reigning King of Ava, and our attainment of a frontier almost conterminous with China.

MARTHA AND MARY.*

MARTHA and Mary is in many respects an odd book. It begins with an account of a rich and very old woman, who lies in a meat-screen before a large fire in a tumbledown house, and who is no sooner introduced to the reader than she dies, so that the reader may possibly think the meat-screen and various other unpleasant details might as well have been left out. All that is necessary is that the old woman should die, leaving her possessions, which are considerable, to a nephew, whose whereabouts is unknown. Then follows a minute description, with all kinds of valueless details, of life in a Nonconformist minister's family. All the family are introduced carefully by name, although only two of the children have anything to do with the story. Then follows a marriage, the circumstances of which we may describe presently; then some space is taken up in describing how the heroine took to writing novels which were not particularly successful. Her plots, she says, were good, because she got them out of the newspapers; but her characters were lifeless. Then comes another marriage, after a ludicrously spun out and improbable misunderstanding; and then the book becomes at once commonplace and wildly extravagant. The commonplaceness is due to the employment of a very well-worn *ficelle* to bring about a catastrophe; the extravagance to the author's unhappy attempt at giving it an air of freshness. The volumes are called *Martha and Mary* because they are all about Martha.

* *Martha and Mary*. 2 vols. London: Smith, Elder, & Co. 1880.

Martha is the daughter of Mr. Pattison, a Baptist minister, and, as we have said, the beginning of the book is filled with all sorts of details concerning the public and private life of Baptists. There is an account of a "baptizing," and we are even treated at full length to an extempore prayer. We are told how one of Martha's sisters fell ill and got well again, and how one of her brothers shook the missionary-box and spent a threepenny-piece which tumbled out on a banquet of goodies. Then a chapter is devoted to the history of the death of two children who have absolutely nothing to do with the story. After this begins what the writer is pleased to call "Book II." of the novel, and this opens with yet another description of a Baptist congregation, which we may as well quote as a specimen of the author's style:—

> The congregation was just about the same, two or three missing perhaps. Papa gave a look round, mentally noting who was not there, with, no doubt, a private resolution to call upon them and know the reason why. I think the female church members' bonnets were perhaps a trifle more painful than ever. For downright, unblushing finery give me a little chapel where each tries to dress each other down, and for hard, square, bad taste it must be Baptist. Papa gave out the hymn two lines at a time and then prayed. We all stood up and turned round facing the other way, and in the middle of the long prayer all about things in general, to my unbounded astonishment, who should come into chapel but a young man! If an elephant had walked up the aisle I should have been much less surprised.

As the heroine was now about nineteen, it was of course high time for a young man to appear. This young man introduces himself as Mr. Alfred Burnaby, the heir of the old woman who died in the meat-screen, and from the following elegant reflections of the heroine it might be thought that his arrival was peculiarly opportune. "I think," she says to herself, while waiting for tea, "I will be married after all" (nobody has yet asked her), "if I could only pick up a sailor who would never be at home; it would be so jolly to have a house of one's own. Men must be awfully silly to marry, if they *only* knew what we have them for." Mr. Alfred Burnaby is not a sailor, and the heroine rather dislikes him than not; but she marries him, as heroines have a way of marrying disagreeable persons, because her father is in debt. It may be noted as one of the numberless details which have nothing whatever to do with the action of the story, that the heroine's sister, Martha, is in love with Alfred Burnaby. After this we have yet another description of the Baptist chapel, and then we find Mr. Burnaby ill treating his wife. Then Martha's father dies, which takes her away from Burnside, the family estate of the Burnabys; and while she is away, a mysterious friend of her husband's, who has been paying a long visit at Burnside, writes to tell her that Alfred is laid up with scarlet-fever, and she had better not come back. The intelligence has an effect opposite to that intended, as Martha starts off at once to look after him. When she got there, however, the cupboard was bare. Both Mr. Burnaby and his mysterious friend have left the house. The reader who has got thus far with this curious composition will already have suspected that Mr. Alfred Burnaby is an impostor. This is, in fact, the case, and the real heir to the property arrives at Burnside soon after Martha, whom he takes, without adequate reason, for a servant. Meanwhile the false Alfred Burnaby is considerate enough to be killed in a railway accident; or rather to seem to be killed; and the real heir, who is an elderly gentleman, is kind enough, with singular suddenness, to adopt the nameless widow (the impostor's true name is never discovered) as his daughter.

It was now that Martha took to writing the novels with the good plots (taken from the newspapers) and the dummy heroes; and while she was longing to meet a man who would give her a real notion of a hero, she went to pay a visit to her mother, who had inherited a little money and was living in London. It is needless to say that the hero turned up with commendable promptitude; but we cannot help adding that he does not strike us as being very much more lifelike than the "dummies" in her former works of whom Martha speaks with contempt. He is a tall man, pale, with smooth dark hair, and dark brown eyes. He has an earnest, affectionate, almost caressing manner. His eyes look unutterable things, and his first appearance produces in Martha "a sudden purely disinterested, almost mesmeric thrill." He "bends over a pretty girl and looks his deceivingest" (*sic*). He fills Martha with such awe that on her first introduction to him she cannot bear to hear him call her Mrs. Burnaby, since it is not really her name; and "at the risk of being thought sentimental" she asks him to call her Mrs. Martha. He soon begins to address her as "my friend," or as "my little friend," or as

"Patty." There is more about Baptist chapels, to one of which this hero, by name Dr. Charteris, goes in order to meet Martha. Mrs. Charteris, his mother, takes an early opportunity of telling Martha that he is engaged to somebody else; and, in spite of every kind of hint to the contrary, Martha believes this false statement to be true. This gives an opportunity for filling out several chapters, a process which is helped by Dr. Charteris being unable to make up his mind whether he owes most to his mother or to the woman whom he wishes to marry. Finally affairs are brought to a crisis by Dr. Charteris being knocked down as the result of a rash interference in a street quarrel between a man and his wife, and by Martha's arriving just in time to pick him up. They are married, in a somewhat remarkable fashion, at St. George's. There is a good deal about Martha's sentiments before and after the birth of her son, and about a page concerning the event itself. Shortly after this has taken place Martha's first husband turns up again. She then takes the remarkable step of hiding in a low slum, the existence of which she has discovered in the course of district-visiting. Then she has a long illness, and meanwhile the first husband spreads slanderous reports concerning her. She becomes a nurse at a hospital, where of course Dr. Charteris is one of the physicians. Fate, it must be admitted, is not alone responsible for this, since this is what Martha writes about it in the record of her curious life:—

> I was not weakly going to give way to self-indulgence or even self-opinions, which generally mean what one likes; but when one cannot sleep, it is a bad look-out, and beyond mere self-control.
>
> And besides, that is all very fine, but I would not allow myself to consider that if I got into a certain hospital, I should hear of Charlie, sometimes even see him though it should be far off, and I could conscientiously avoid him, but he would be there sometimes, under the same roof. Any hospital would do, and it was for no private reason, of course, but—but—I would move heaven and earth to get into that special one, and I did.
>
> I liked it very well, very much even; the quiet was heavenly; one could breathe in the great corridors; pleasant society was always to be had; "good" to be done was always at hand; one did not have to exhaust one's good impulses in a five-mile walk to and from the "objects."
>
> The sediment of pain was only stirred up now and then. On the surface there were bright-coloured quilts, cheerful fires, toys, flowers, and for the most part rosy, healthy-looking, smiling faces.
>
> That is the most astonishing thing of all. I cannot account for it unless mental worry is more distressing than physical pain; but any two or three hundred workwomen, clerks, and business-men look far more pale and haggard than the same average of hospital patients—of course there are exceptions. Above all—life had an interest.

The first definite news she gets of Dr. Charteris is that he has offered himself as a subject for the experiment of transfusion, the person to be benefited by it being the so-called Alfred Burnaby. Charteris expects to die, but in fact Burnaby dies, and the doctor, at the point of death, recovers on hearing this. "All England," says the writer, "looked for the result, and called the experiment a failure, but only two or three ever knew that what appeared a misfortune was really a great mercy." Charteris and Martha go through the marriage service for the second time, and the last chapter of this odd farrago is headed "The Pacific Ocean," the writer thereby meaning, it may be supposed, that all ends happily. How the boy got over the difficulty of his illegitimate birth we are not told. It is clear that this plot at least was not taken from the newspapers, or, if it was, they must have been an odd collection. Whether some of the characters are lifelike, people more experienced in the ways of Baptists than we are must decide.

HENRY OF HUNTINGDON.*

It seems surprising that a chronicler whose name is so well known to students of English history as Henry of Huntingdon should never have been put forth in England since the time of Queen Elizabeth. That work of Sir Henry Savile, it is true, was nearly superseded by an edition of Mr. Petrie's thirty years ago; but the editor's death prevented his book from becoming complete. Mr. Thomas Arnold, the editor of the *Select Works of John Wyclif*, has in the scholarly volume before us repaired the omission. His critical apparatus leaves little or nothing to be wished for; and he has supplemented our knowledge of what he calls "the filiation of chronicles," one of the nicest points in literary criticism, by a new and acute study of the manuscripts of his author.

Dr. Stubbs, in his preface to Hoveden, was the first to point out that an obscure Durham compilation, the *Historia post Baedam*, was worked up entire into the texture of Hoveden's first part. Mr. Arnold has now shown that it also entered largely into the composition of another work, which he has for the first time brought to light. This is a history claiming the name of Marianus, which exists in four copies, hitherto believed to be manuscripts of Henry of Huntingdon. We have now the pedigree of these chronicles complete from the time of Bede. His *Church History*, ending in 731, is followed by the *Gesta veterum Northanhymbrorum*, which break off in 803. These bear a distinct Northern colour, and were probably compiled by a Northumbrian monk early in the ninth century. Next come the Winchester Chronicle, Asser's Life of Alfred, and the continuation of the Northumbrian Annals by a monk of Chester-le-Street; which to a great extent overlap one another in time, and are mutually dependent. Florence of Worcester carries the history on to 1117, the year before his death; and an edition of the Northumbrian Annals, much interpolated, by a canon of Hexham about 1130, completes the earlier series.

The next cycle involves greater difficulty. The histories of Simeon of Durham (to 1129) and Henry of Huntingdon (ultimately to 1154) have long been known and read. But their relation to previous chronicles is still partly uncertain. Mr. Arnold is inclined to see the foundation of the former in the Northumbrian Annals with the Chester continuation, the rest being built up out of Florence of Worcester. The sources of Henry of Huntingdon are different and wider. Eutropius and Aurelius Victor, Bede, and the first two books of Nennius furnish him with almost all of his earlier facts; we shall see, however, afterwards that he was not content with mere facts. Since Bede, he relies on "such things as we have been able to find in the stores amassed by the careful industry of elder writers" (p. 117.) That is to say, he used the Anglo-Saxon Chronicle; and, as Dr. Liebermann has apparently proved in the *Forschungen zur deutschen Geschichte* for 1878, he used it in the two recensions which we know from the Peterborough (E.) and Abingdon (C.) codices. It was from the latter, of which he availed himself only occasionally, that he got such materials as the genealogies of kings, the song of Brunanburh, and the notices of the years 891, 894 to 920, and 944. Unlike Simeon of Durham, he seems not to have made use of Florence of Worcester. Dr. Liebermann quotes a number of common mistakes—*e.g.* of translation from Old-English, with which he was imperfectly acquainted, where Florence might have kept him right. Thus he makes Æthelflæd daughter instead of wife to Æthelred, the ealdorman of Mercia, and consequently her daughter Ælfwyne becomes her sister (pp. 157, 158). *Myranheafod* he translates absurdly "caput formicae," where Florence has "caput equae" (p. 178; see the *Forschungen*, vol. xviii. p. 283). Mr. Arnold, it must be mentioned, does not consider the absolute independence of Archdeacon Henry to be certainly established (pref., p. lviii.) He adds to his authorities, besides the abridgment of Tudebodus for the first Crusade, some Franco-Norman annals now lost, and the works of Dudo of St. Quentin and William of Jumièges.

After Simeon and Henry there comes the *Historia post Baedam*, a compilation of a very composite character, much of it being taken directly from Henry of Huntingdon. It is, as has been said, practically represented by the first part of Hoveden (see Dr. Stubbs's pref., vol. i., pp. xxvi. to xxxiii.) What Mr. Arnold has brought out is the fact that it suffered a further redaction and a new infusion from Henry of Huntingdon, and that this last composition, bearing the name of Marianus, has until now lain concealed under the supposed guise of Huntingdon manuscripts. Marianus had made a "Universal Chronicle," reaching from the beginning of the world to his own day—the time of William the Conqueror. Florence of Worcester is for the most part an enlarged edition and a continuation of this book. The connexion between Florence and the *Historia post Baedam*, and the incorporation of much of the latter in the pseudo-Huntingdon manuscripts, gave rise to a promiscuous use of Marianus's name; although in this repeated filtration an indefinitely small part of his work survived. Finally, the editor began and ended his composition with a fairly accurate transcript of Henry of Huntingdon; and thus the last strain was added to the web of critical perplexity, and the "Marianist" book became confounded with the history of our Archdeacon. This is the "filiation of chronicles" which Mr. Arnold has completed. We have traced it at length, because, though the series has been fully described by its unravellers, Mr. Arnold's arrangement of his facts is not so lucid as we could have desired. We pass from the criticism to the book itself and its author.

Biographies of Henry of Huntingdon, from Capgrave's in the first part of the fifteenth century onwards, have not been wanting. But they give us little real knowledge of the gay and heedless life of the young scholar, as he passed from his home in the fens, while William II. was still reigning, to the brilliant court of the Bishop of Lincoln. For Robert Bloet had little of the spiritual churchman in him; and he lived the princely feudatory that his noble revenue allowed him to be. At Lincoln Henry learned the breeding of the courtier rather than that of the clerk. He wrote epigrams and poems, two long ones "of Love" and "of Herbs," others of "Spices" and "Gems." Years after, when writing to a friend "touching the Contempt of the World," he recalls with a lingering insistence, that looks half like regret, the glories of his boyish life (p. 299). His earnest renunciation of them only emphasizes the violence of the wrench which turned the courtier into the country clergyman. But Lincoln was not wholly given over to pleasure and state. There was yet a remnant, and the tradition was still strong, of that colony of zealous and learned clerics whom Remigius, the founder of the see, had chosen to be his first Chapter. Henry mentions with loving regard his "master," Albinus of Anjou (p. 301). And it is to this scholarly training that we must certainly attribute the idea and the performance of his historical work. The position of Archdeacon of Huntingdon, which he attained in 1110, or perhaps later, left him the calm and the leisure to carry it into execution. The book was done in 1130; it was continued and reissued in 1135, 1139, and 1145; a final revision brought it down to 1154. The original seven books grew into ten, as one was divided, and two were intercalated before the concluding book. These last are

* *Henrici archidiaconi Huntendunensis Historia Anglorum: the History of the English by Henry, Archdeacon of Huntingdon.* Edited by Thomas Arnold, M.A. (Rolls' Series; 74th Issue.)

of a miscellaneous, rather than purely historical, character; and Mr. Arnold has judiciously followed the example of his predecessors in omitting them, with the exception of one epistle, which he prints in an appendix. Of the rest he has given extracts sufficient to let us see precisely what value or interest they represent (pref., pp. xvi. to xxx.), and most readers will agree with him that it is not much.

The symmetry of the history gains by the absence of these heterogeneous insertions. How they ever came to be in it is a wonder. For Henry set out with a very just and modern conception of his scope. "History," he says in the prologue, "mirrors to us the past as though it were present; it gathers from things past the image of things to come." And he spared no pains to make the work answer his idea. Ornamented, in the manner of the age and with more than its usual learning, with a store of classical scraps, and with excellent speeches ready made on all occasions, it describes the British islands and their people, and tells their story from the coming of Julius Cæsar to the death of King Stephen. Henry opens, as he promised, in a lively and picturesque way. But he soon falls into the mannerism of the chronicler, and a chronicle, as Ralph de Diceto said, is but "the shadow of a history" (Stubbs, preface to *Benedictus Abbas*, vol. i. p. xi.) Its arrangement has no other basis than that of time. It only touches occasionally, and as by accident, the deeper relations of cause and effect, the political and social bearing of events. Yet, without attaining this, Henry of Huntingdon has not seldom reached what is commonly viewed as the climax of historic art, the presentment of action in a dramatic form. And this he owed, not to any theory of composition, but to the abundance that lay before him of folk-songs and sayings. Our quarrel with him is that he used them so sparingly. Few will refuse to acknowledge with Mr. Freeman that we have one instance of such use in the account of Stamfordbridge, where, "as soon as he reaches the actual fight, his narrative, hitherto meagre and inaccurate, suddenly lights up and becomes minute, poetical, and evidently founded on an accurate knowledge of the spot" (*Norman Conquest*, vol. iii. p. 721).

> Pugna igitur incepta est, qua gravior non fuerat. Coeuntes namque a summo mane usque ad meridiem, cum horribiliter ruentes utrinque perseverarent, maximus numerus Anglorum Norwagenses cedere sed non fugere compulit. Ultra flumen igitur repulsi, vivis supra mortuos transeuntibus, magnanimiter restiterunt. Quidam vero Norwagensis, fama dignus aeterna, super pontem restitit, et plus quadraginta viris Anglorum securi caedens electa, usque ad horam diei nonam omnem exercitum Anglorum detinuit solus: usquequo quidam navim ingressus per foramina pontis in celandis eum percussit jaculo" (p. 200).

We cannot allow with Dr. Liebermann and Mr. Arnold that this is merely an example of the author's "embellishing turn" (pref. p. lix.), though Henry certainly displays it elsewhere. His use of oral information and unwritten tradition is also generally indistinct. He speaks of the massacre of St. Brice, 1002, "whereof we have in childhood heard certain very aged persons tell" (p. 174). But a story at such a distance of time can hardly have retained on either side much of its original elements. When he comes to his own day he is surprisingly barren of new data. Except a couple of anecdotes, he adds to the history of the Conqueror and William Rufus nothing but an account, personally interesting, of the removal of the bishopric of Dorchester to Lincoln, and a portrait of Remigius. For Henry I. and Stephen he is fuller, but hardly tells us anything we do not know from other sources.

The value of the history in its earlier part is, as Mr. Freeman has pointed out (vol. ii. p. 641), that it "always represents an independent tradition." His judgment of Coolred of Mercia, "avitae virtutis haeres" (p. 110), his version of the history of Eadric Streona (p. 176 and fol.), and of the death of Godwine (p. 194), may illustrate the fact. The student of Shakspeare will seize another instance, the original, through Holinshed, of the last scene in *Macbeth*, where Siward says "Gaudeo plane, non enim alio me vel filium meum digner funere" (p. 194). Henry's looseness, however, and want of precision make us wonder how his first editor, Sir Henry Savile, could speak of him in company with Hoveden, as "authores cum primis boni et diligentes, verissimique superiorum temporum indices"; still more how our most recent historian could distinguish him as "a brief but accurate annalist." Try as he will to hide his personality, he appears throughout the imaginative writer that his boyhood promised. His work is filled with fancied speeches, and pieces of his own verse are scattered through his pages, at first veiled under the oblique phrase "quidam scripsit" (p. 11), but in the end emerging into the declared "sic diximus heroice" (p. 291). Though hardly showing a political bias, except the national one which held the kingly line to have been unbroken by the Conquest, Henry was left, in the reaction from the feudal splendour of Bishop Bloet's surroundings, a strong partisan of the stricter school among the clergy. He wishes for an "increase of the episcopate," and an organized "church-work." Gloucester, Oxford, and Leicester should have their bishops (p. 111); the clergy should abandon the cares of the world (pp. 305 to 318). We have no means of knowing how far Henry's actual efforts in his archdeaconry agreed with his principles. In his book he remains a type of the scholarly and practical churchman, the creation of the Norman Conquest and of Lanfranc. At the same time he is no class-historian; and his interest is far more national than local.

A TREASURY OF ENGLISH SONNETS.*

IT seems very difficult for the purveyors of popular literature to understand that enough is as good as a feast, and indeed much better. Mr. Main has set down before us in this *Treasury of English Sonnets* a banquet of formidable proportions, and we confess that our appetite fails us in the presence of so great a quantity and of a quality so various. A good sonnet is a very pleasant and attractive thing; but in this volume we are offered nearly six hundred sonnets, by no means all good, or even tolerable; and the effect of reading these little pieces one after another soon becomes exceedingly tiresome and vapid. Mr. Main has taken so much pains, and has displayed such care and research in his notes, that it is really a misfortune that it is impossible to praise the result. Unluckily, in poetry, learning and industry are very poor substitutes for taste; and, had Mr. Main put aside three parts of his pedantry, and occupied himself a little more with the essential value of the sonnets, he might have produced a useful and attractive book. As it is, his volume is a mine in which lazier compilers will dig, and so very considerably lighten their labours; but it is hardly a book that any one will take up for the sheer pleasure of the poetry to be found in it.

The same error has been fallen into by those who have preceded Mr. Main in the compilation of English sonnets, and we might have hoped that the warning would have been taken in a more sensible spirit. In his *Specimens of English Sonnets*, in 1833, a work of very considerable scholarly value, the late Mr. Dyce was rather concerned with reviving the memories of forgotten poets than with confining himself rigidly to the very best productions in sonnet-form. Still more lax and effusive is Leigh Hunt's posthumous and unrevised *Book of the Sonnet*, into which the desire to attract the Transatlantic public introduced far too many American sonnets of a wholly ephemeral nature. Seeing that both these works have lost their value and have failed to gain a place in our living literature, it was to be supposed that Mr. Main would try to avoid their faults; but as a matter of fact he has erred more in the same direction than either Leigh Hunt or Dyce. By far the best selection with which we are acquainted is one made in France under the direction of M. Charles Asselineau, and published in 1875 under the title of *Le Livre des Sonnets*. This little book professes to contain "fourteen dizains" of selected sonnets, the best to be found in all French literature, and arranged in chronological order. Of course, the sonnet has never flourished in France with the same vigour and freshness which it has shown on this side of the Channel; and it must be confessed that, even in this small collection, there are not a few specimens of a conventional and unimportant cast. But the number of sonnets is so few, and the selection so careful, that the book gives the reader an agreeable and, if we may so say, a classical impression. This is precisely what is wanting in Mr. Main's ponderous collection, and we can only wish that some one would select one hundred and forty from among the best of these miscellaneous six hundred, and publish them in the neat and comfortable form adopted by the firm of M. Lemerre. We should then possess a little volume of rare beauty and excellence, and we conceive that no real lover of poetry would waste a regret upon the four hundred and sixty sonnets relegated to obscurity.

Abandoning, therefore, the hope of finding in Mr. Main's *Treasury* any aid to intellectual enjoyment, or indeed of regarding it as, in Charles Lamb's sense, a book at all, it is left to us to consider its pretensions as a storehouse of material, good, bad, and mediocre. A special feature, and one characteristic of our antiquarian age, is the prominent place given in it to the minor writers of the time of Elizabeth. In John Florio, the translator of Montaigne, Mr. Main is ambitious to present to us an unknown English poet; but we cannot say that the sonnet, "Concerning the Honour of Books," on which he builds this claim, seems to us to display any poetical gift beyond that so common in the age of Shakspeare, of clothing the commonplaces of human vanity in a dignified and pleasing robe of fluent verse. Barnabe Barnes, whose name will be still more unfamiliar to the ordinary student of poetry, has a much more valid claim to recognition. The following sonnet, taken from a very rare volume of 1595, *A Divine Century of Spiritual Sonnets*, is certainly worthy of a place in that smaller selection which we hope to see, and gives us a favourable idea of the powers of Barnabe Barnes:—

> Unto my spirit lend an angel's wing,
> By which it might mount to that place of rest
> Where Paradise may me relieve opprest;
> Lend to my tongue an angel's voice to sing
> Thy praise my comfort, and for ever bring
> My notes thereof from the bright east to west.
> Thy mercy lend unto my soul distrest,
> Thy grace unto my wits; then shall the sting
> Of righteousness that monster Satan kill,
> Who with despair my dear salvation dared,
> And like the Philistine stood breathing still
> Proud threats against my soul for heaven prepared:
> At length I like an angel shall appear,
> In spotless white an angel's crown to wear.

The couplet at the end of this interesting poem reminds us of a fact which becomes unpleasantly emphasized when we read a great number of the so-called sonnets of the sixteenth and seventeenth centuries—namely, that, in point of fact, these pretty quatorzains

* *A Treasury of English Sonnets.* Edited from the Original Sources, with Notes and Illustrations, by David M. Main. Manchester: Ireland & Co.

are not sonnets at all. In the French collection we have just referred to, only one writer closes the sonnet with a couplet, and this is the poetess of Lyons, Louise Labé. But the license which in France was accidental became the rule in England, so that of one hundred and twenty sonnets which in Mr. Main's collection precede the first of Milton's, only two, one by Sidney and one by Constable, conform to this primal rule of the Petrarchan model. In fact, as we have lately pointed out, the "sugred quatorzains," of which Shakspeare's are the most familiar, have so very little in common with the pure sonnets of Wordsworth or of Petrarch, that some other term is needed to define them. It is probably the wide cultivation of an entirely dissolute form of the sonnet in England that has produced the general impression, even among instructed critics, that the exact rules of construction may in this case be always indefinitely laid aside. For instance, Mr. Spedding has actually held that "the necessity of forcing the thought into the frame has spoiled many good sonnets," and that the omission of certain lines would improve some examples of this form of verse. We are at one with Mr. Main when, commenting on this opinion, he remarks, "Before a sonnet can be 'spoiled' it must be a sonnet; a sonnet has fourteen lines. Discard any one of the objectionable lines, and where is the sonnet?" The whole matter may probably be taken as a test of instinct for poetical form. Sydney Dobell, whose lack of style was so marked as to interfere with the lasting worth of the most interesting of his writings, was a still greater offender in this respect than the Elizabethans, for he thought it legitimate to compose sonnets in fifteen lines.

Mr. Main is so painstaking, and fishes with so fine a mesh, that it is not often that a good sonnet escapes his too capacious net; but in his selection from Dr. Donne we find reason to complain that he has given us what we do not want, and has withheld from us what we do want. About the famous "Death, be not proud, though some have called thee so," there can be no two opinions; but of Mr. Main's other specimen from Donne, "As due by many titles, we resign," not much more can be said than that it reflects the scholastic ingenuity which was the weak side of the poet, and not the lyrical passion which was his strong side. We much prefer the seventh of the series called "Holy Sonnets," the opening phrases of which were probably in the mind of Milton when he wrote his "At a Solemn Music":—

> At the round earth's imagined corners blow
> Your trumpets, angels, and arise, arise
> From death, you numberless infinities
> Of souls, and to your scattered bodies go
> All whom the Flood did, and Fire shall, o'erthrow;
> All whom death, war, age, agues, tyrannies,
> Despair, law, chance hath slain; and you whose eyes
> Shall behold God, and never taste death's woe;
> But let them sleep, Lord, and we mourn a space,
> For if above all those my sins abound,
> 'Tis late to ask abundance of Thy grace,
> When we are there. Here on this lowly ground
> Teach me how to repent, for that's as good
> As if Thoud'st seal'd my pardon with my blood.

Milton found no followers for a hundred years after his practice of the sonnet; but when, towards the middle of the eighteenth century, it once more came into fashion in England, his pure Petrarchan specimens were taken as their model by the sonneteers of the school of Gray and Warton. Several examples of this gentle rivulet of inspiration deserve to live, in spite of Wordsworth's condemnation of the best of them all, Gray's sonnet on the death of Mr. Richard West. But when Gray, Mason, and Warton had passed away, the sonnet fell into Della Cruscan hands, and especially into those of a few ladies more remarkable for sentiment and cultivation than for talent. In the practice of Miss Charlotte Smith and Miss Anna Seward the sonnet became as nerveless and as incorrect as in that of the laxest of the Elizabethans, and even Cowper's exquisite quatorzain to Mrs. Unwin, "Mary! I want a lyre with other strings," ends with the hated couplet. Bowles, about whose poetical genius Coleridge held so strange a heresy throughout his life, was not more skilful; and as a matter of fact the sonnet, in its noblest form, was handed by Milton down to Wordsworth without an intermediate station. Wordsworth has written more good sonnets, in point of number, than any other English poet; perhaps, considering the vigour and versatility of his genius, it might be said more than any other European poet; yet we confess that there are not a few of the sixty-one examples printed by Mr. Main which seem to us rather interesting from the intellectual than from the purely poetical side, so rarely does inspiration, even in the case of the greatest poets, produce an absolutely perfect sonnet. As we reach the confines of the present century the selection becomes wild and profuse to the last degree; the examples from Lord Thurlow and John Wilson, interesting to the present generation from their unfamiliarity, do not tend to induce us to reverse the decision that time has passed on the claim of these writers to be considered poets. Sir Aubrey de Vere, on the other hand, a poet whose dignified and recluse mind courted seclusion, excelled in the use of the sonnet, and may very well be recommended to the study of lovers of poetry. The oblivion that has fallen round this refined writer, who died in 1846, is shown by the fact that some of his best pieces are constantly attributed to the living author of the same name.

The greatest error in Mr. Main's volume is that he does not keep to his intention of including sonnets only by deceased poets, but extends his scope, fitfully and without judgment, to a few living writers. Here, where he cannot be guided by traditional opinion, his want of taste and tact has led him into great absurdities. At least half of the sonneteers from whom he quotes bear names totally unknown even to students of poetry, and some of the best names of our generation are absent. This fact gives a good notion of the calibre of the book, which is learned and eminently laborious, but edited without taste or feeling.

MARY CARPENTER.*

WITH the life of Mary Carpenter passed away one of the most remarkable women of the century. Few persons perhaps realize how much she has helped to develop our more enlightened views upon education and the treatment of the semi-criminal class. Mary Carpenter was born at Exeter, in 1807. When she was ten years old her father, Dr. Lant Carpenter—who will long be held in affectionate remembrance by those who lived under his wise and kind control as a schoolmaster—became one of the ministers of the well-known Unitarian Congregation meeting at Lewins Mead, Bristol. From that time until his death in 1840 Mary Carpenter was first the pupil and then the able assistant of her father's labours. To him she owed an education far more thorough and advanced than falls to the lot of most women. An interesting letter of Dr. James Martineau, who was one of the many eminent men who passed some years at Dr. Carpenter's school, gives us an account of her youthful attainments, in which Latin, geology, natural philosophy, and chemistry appear as part of the daily studies. A marked seriousness of purpose distinguished her from early childhood, and the accuracy and precision that her father's teaching enforced stood her in good stead when later life developed the powers for which she became remarkable. To this early training Mary Carpenter looked back with affectionate reverence. Throughout her life the memory of her father blended consciously with all she did. When nearer seventy than sixty, the impression left on friends in America who then saw her for the first time was that they were "talking with *some one's* daughter; her words had so much filial reference in them." To quote Dr. Martineau, "a man must be without head or heart who . . . . could forget such a master as Dr. Lant Carpenter, or remember him without affectionate veneration." Her father's position naturally brought her into contact with many eminent men, and most of the schemes that owe their origin to Mary Carpenter can be traced to the inspiration furnished to her in her youth by her father's friends. There were other sides of her character on which the home influence told. Both parents had an earnest devotion which showed itself in the marked individualistic way that is often to be found among Nonconformists. Taught from an early age to bring the strictest investigation to bear upon each thought and action, she became self-analytical and conscientious to a very high degree. In later life she could view more calmly the growth of her religious principles; but her diary is filled, while still young, with heartsearching scruples and bitter confessions of shortcomings. After her father's death, which took place when she was thirty-three, Mary Carpenter lived on with her widowed mother at Bristol until 1856, when Mrs. Carpenter died, and her daughter found herself with no home tie remaining and with a sense of loneliness that was at times overwhelming. Her always active life needed the repose that home ties afford to restore the right balance. The interests in Mary Carpenter's life were manifold, but they did not make up for the loss of the ever-ready sympathy that the presence of her mother assured to her. She needed something to supply the feeling that she was needed for her own sake. This she partially gained in later life by adopting a daughter, but whether it completely filled the void is not told. The work, however, of her life left little time to spare for regrets or self-musings. One enterprise led on to another in rapid succession, and running through them all is a vein of unity that enables us to see how each would naturally arise out of the needs and shortcomings of those undertaken before.

Her earliest efforts were directed in 1835 to carrying out in Bristol a plan of Dr. Tuckerman, of Boston, by which the poor of that city were to be more systematically looked after than was then the custom in our English towns. An organization was formed under the name of the "Working and Visiting Society," through which it was hoped the very lowest classes might be reached and helped. This method was that which we are now accustomed to consider the only reasonable one—namely, that regular records were kept, and no relief administered without the sanction of a committee; but in 1835, when it was first introduced into Bristol, the plan was an entirely new one. For more than twenty years Miss Carpenter acted as secretary, and took also an active part in the actual visiting. From the knowledge thus gained of the lowest classes sprang the scheme of the Ragged Schools which first opened the eyes of the public to the needs of our pauper children, and culminated in 1870 in the Elementary Education Act. The battle she fought, however, was long and arduous. Everything had to be done by herself personally. The pivot on which all her hopes turned was the exercise of personal influence over that portion of the population which had been brought up in crime and ignorance from their birth. By no fault of their own these children were brought into the

* *The Life and Work of Mary Carpenter.* By J. Estlin Carpenter, M.A. London: Macmillan & Co. 1879.

world. Though neglected by the State in the comparative innocence of their early youth, they were certain to come upon the State for maintenance of a more costly kind when ignorance and crime had done its work upon their lives. Year after year she reiterated her pleadings for these Arab children. When her voice was powerless in council, she fell back upon the practical working of her own schemes for reaching a class of children that National and British Schools did not succeed in getting hold of. After a time she gradually became convinced that another kind of school was also needed. The simply ignorant and poverty-stricken outcasts she could reach through Ragged Schools; the children already fallen into habits of vice, but not confirmed in them, had nowhere to go except to prison, where contact with crime in a more pronounced form only encouraged and developed the seed of evil. Reformatory schools were needed; but they must be based upon a system of home life if real reform could be looked for in the children. This was a startling suggestion, at a time when prisons themselves had hardly become humane in their treatment of convicts, and it fell at first upon ears hard of hearing. After many journeys to London to confer with influential people interested in the cause she had at heart, Miss Carpenter determined to open a Reformatory for children of the class she wished to reach, and to undertake the management of it herself. When it could be proved how well such a school answered, she had more hope of convincing those who withstood the whole scheme of reforming institutions. Through the generous help of Mr. Russell Scott, who placed suitable premises at her disposal, and through the liberality of Lady Byron and others who came forward to her aid, she started a school at Kingswood, framed upon plans which were in successful operation at Mettrai and at the Rauhe Haus near Hamburg. Into the working of this school Mary Carpenter threw herself with characteristic energy. A committee was formed, and for some years she retained practical control of the institution. Finding, however, that the union of boys and girls under one roof was not desirable, she shortly afterwards turned her attention to starting another institution for girls only; and without neglecting Kingswood, which now contained boys alone, she opened in 1854 a Reformatory School for girls at Bristol, which became her head-quarters for life. This school she managed solely. The officials were under her, and on her alone fell the whole responsibility. In spite of these new interests and duties, no old ones were allowed to drop. The Ragged School, the Sunday School, and Kingswood continued to draw from her the same close attention and care that she had given to each of them when she first set it on foot. Her heart only seemed to expand with the birth of each fresh scheme for the good of the classes she loved so well, and she who had no children of her own was recognized as a mother by numberless little ones who owned no parent.

It was not by these means alone that she strove to win a place for her undertaking in the public esteem. She was constantly in correspondence with public men upon educational questions. Legislation which should give to Ragged and Industrial Schools the same openings that the National and British Schools then had was the point she especially pressed. Sir Stafford Northcote's Bill of 1857 satisfied her entirely; but its progress was stopped by the dissolution of Parliament, and Sir Stafford Northcote not being returned at the general election, the measure passed into the hands of Mr. Adderley, and was carried through the House of Commons in a different form from that desired by Miss Carpenter. It is true her wishes were not always those that showed themselves to be the wisest when put to the test. The "day-feeding Industrial Schools," which provide food for the children but return them to undesirable home influences in the evenings, have proved to do often more harm than good by shifting from the parents' shoulders the responsibility of providing food for the family, while the children lose the good that entire absence from home might have gained for them. The Ragged Schools at that time had more to be said for them; and if, as Lord Granville wrote in a letter to Miss Carpenter, "all the Ragged Schools for the present and for the future were to have" her as manager, "there would be no difficulty"; but, as it was, numbers of schools and refuges of a less desirable kind were induced by the minute of June 1856 to declare themselves "Ragged or Reformatory Schools," and the national expenditure was increased alarmingly. It is only through seeing the actual working of such measures that their wisdom can be ascertained. Such people as Mary Carpenter are greatly needed to rouse public thought and invigorate public action; but the ultimate conclusion of the nation can only be arrived at through careful consideration of both success and failure on a large scale.

Strong and energetic as Miss Carpenter was in all that touched the welfare of the poor at home, her efforts and enthusiasm were destined to find a wider field. As year after year passed, and the measures she had at heart failed to pass into law, she fell back once more upon interests which had been keenly excited in early youth. In 1833 her sympathies had been kindled towards India by a visit of the Rajah Rammohun Roy to Bristol. This remarkable man had grafted on Hindu learning the larger culture of European thought, and his character fitted him to take the lead among those whom he met. His studies had directed him towards Christianity, which he ultimately embraced, though not in the orthodox form, and the controversy excited by this brought him to England. But he came only to die. With him faded hopes which many had formed for the future of India, but not before they had found a lasting home in the heart of Mary Carpenter. Young as she was at the time, the aspirations of the Rajah fell as seed into a ground already prepared for the reception of grand projects, through the ardent passion that her father had early aroused in her for Negro emancipation. This seed, however, was not destined to bear fruit until more than thirty years had passed. The delay caused by the slow action of Parliament in educational reform had depressed her in body and mind, and she hailed with delight the return of enthusiasm which the visits of some distinguished natives of India in 1864 again aroused in her. The subject they had at heart was female education. She grasped it at once, and from that day she felt more and more drawn to go herself to India to open the way for the education of native women. Two years were destined to pass before this enterprise was carried out; but when once her enthusiasm was kindled, it never slept until it could be put into practice. In 1866, at the age of fifty-nine, she made her first visit to India, and spent six months in inspecting existing educational agencies, and in setting on foot others that might prepare the way for fresh enterprises. She herself started a free school for the lower classes at Calcutta, and when again she visited India two years later, it was to found a Female Normal School at Bombay and another Native Girls' School at Ahmedabad. Twice more she revisited India, but the difficulties in the way of female education were greater than she had anticipated. The schools she started gradually ceased to interest those to whom they looked for support, and her later visits brought disappointment and discouragement to her hopes of anything like a comprehensive regeneration of the women of India. The last seven years of her life found Mary Carpenter reaping the reward of her labours. Once more she returned to the old work in England with the enthusiasm of her earlier days. Her judgment might sometimes be at fault, but the will and perseverance to carry out her projects never failed her. A visit to America served to show her how far her name had travelled. She repeated there the inspection of schools and prisons, and, until her death in June 1877, continued to bring the same energy and devotion to bear on the questions that had absorbed her through life. When apparently in her usual health one evening she passed away peacefully as she slept.

We have sketched the life of Mary Carpenter at too great a length to be able to do more than glance at the merits of the biography itself. Owing partly to the fact that she was one of those women who become absorbed in their work, and therefore did not touch the outer world on many points, and partly to the fact that, after the early chapters, her biographer has dwelt but slightly on the more private side of her life, the book is too much a continuous account of the successes or failures of her various schemes to be very attractive reading for those who do not care for such questions. Perhaps it is from the desire to lessen this effect that there is a slight strain at effect in the table of contents. To her family the work of Mary Carpenter might easily appear in the light of a sacred call, and each successive step would appear a special leading. The book might have had a keener interest if it had been more varied in its treatment; but in Mary Carpenter herself we shall look in vain for variety. Her strength lay in a single purpose carried out through a long life with single-minded perseverance; the charm that comes from diversity of interest and ready sympathy with people unlike herself could hardly have been hers. But it is the work of such women as Mary Carpenter that will live; and all that mars the recollection of their self-devotion may well be forgotten when death has closed a life that has been nobly consecrated to the welfare of others.

TWO WOMEN.*

WE should have liked this story a great deal more had there been only one woman instead of two, and only two volumes instead of three. The reader would act not unwisely who should skip over the second volume altogether, and pass from the end of the first, where the opening scene of the hero's love-making is brought to a close, to the beginning of the third, where, after an interval of seven years, the curtain draws up on the second and concluding scene. He would not have the slightest difficulty in following the thread of the story were he once informed that in the part which he had omitted was described, at very great length, the love that the hero had made to a very heartless beauty of society. This passage in the life of Mr. Hugh Ludlow we found, we will confess, uncommonly heavy reading. We were the more disappointed with it, and even vexed, as we had gone through the opening volume with much pleasure. Here we had found but little need for skipping. We are not disposed to think any the worse of the author—on the contrary, we ought perhaps to think a good deal the better—because she has not succeeded in giving life to such an artificial creature of society as Miss Cicely Verner. In a slight confusion of metaphors she says that, to the hero's mind, his first love, Dorothy Wilmot, "seemed like some pale image in the distance, eclipsed and almost blotted out by that other dazzling figure." We were not so dazzled by Miss Verner as to allow her either to eclipse or blot out her fair rival. We found her so intolerable and so dull that we could only keep ourselves from falling to sleep, as we read of her, by turning over the pages with the utmost rapidity. We dared not pause for a moment and try to read steadily on, as we knew that the volume would at once fall out of our hands and we should sink into a deep slumber.

* *Two Women.* By Georgiana M. Craik, Author of "Mildred," "Faith Unwin's Ordeal," &c. 3 vols. London: Richard Bentley & Son. 1880.

Though we think all the better of the author, as we have said, for her inability to render her artificial heroine interesting and lively, yet we cannot but regret that her want of judgment should lead her to attempt a task for which she is but little fit. Let her henceforth leave the Cicely Verners of the world to her sister novelists who know nothing of women but as they are artificial. She has higher powers, and can paint with a skilful hand and a graceful touch woman as she is true to nature. She has not at her command, she ought to know, that profusion of words which is required by the writer who would describe a heartless beauty. She deals in very few words, if indeed in any, which she does not understand. We were a little alarmed almost at the opening of the story by her use of *exordium*. It is a somewhat strange word to apply to "some excellent advice" which a sister gave a brother when he was starting on his journey, and looks a little as if it were confused with exhortation. But, after all, a sister's advice, even if it does not always have an end, must at all events have a beginning, and so perhaps the word is here used with understanding. Later on we came to the dazzling figure that eclipsed and blotted out a pale image. But here we are pretty well at the end of our author's "wealth of words"; and therefore it will be at once acknowledged by every one that she is indeed ill fitted for all the purposes of modern writing. Then, too, she gives no descriptions of scenery. The scene of the first volume she lays in the mountain district of Wales. Her heroine, moreover, is a Cumberland girl, though transplanted to a Welsh parsonage. The girl had the greatest enjoyment of scenery, and liked nothing better than mountains. Strange to say, she seems to have been content with merely climbing them, and never once found it needful to talk about them, still less to describe them. She, poor spiritless creature, would spend a whole afternoon in roaming over the hills with a young Oxonian, without once halting on the top of some lofty hill to bid him admire the tender light, or the shimmering sheen, or the glinting aureole round the violet brow of some purple crag in the opaline west. Now the young reader whose reading carries him back but a few years may very well ask, how are these volumes ever filled when big words and fine descriptions are left out? You might, he would think, as well expect a bladder to become blown if no air were allowed to enter it. Nevertheless, Miss Craik, in spite of her simplicity of taste, does manage to fill two of her volumes in an agreeable enough manner. If we might venture to use a word which, though undoubtedly old, has never yet managed to struggle up into good society, she is a dab at love-making; and love-making, too, of the good old simple school. She takes her hero, the only son of a wealthy country gentleman, into a quiet parsonage for a long vacation's reading. His tutor is a simple elderly widower, with whom is living his orphan niece, Dorothy Wilmot. Under the very nose of the unsuspicious old gentleman the young people make love for almost a whole volume together, and yet he would never have discovered it had it not been for the vigilance of an old servant. He had indeed remarked that the young man in his reading let his thoughts wander in an unaccountable way. "I cannot tell how it is, Mr. Ludlow," he said to him one day, "but it seems to me that you experience a certain difficulty in fixing your mind steadily on your work." He beat about for some while for an explanation of his inattention. "I have wondered whether the extreme quietness of the life you lead with us may possibly have a depressing effect upon you." It is but a small space that the old rector fills in the story; yet his character, if but lightly sketched, is drawn with a good deal of skill. Very touching is his grief when he at length discovered all that had been going on, and felt that he might be reproached by Hugh's father with a breach of trust.

Dorothy's character is charming throughout. She is just one of those girls whom an old fellow may fall in love with for a brief hour, as he reads her story by his fireside, and goes back in his thoughts to the days when all the world was young. We do not like to speak with any tone of authority about lads and lasses and love-making. It is a good many years since Plancus was consul. Yet we are almost bold enough to maintain that Dorothy is too old by a couple of years when the hero—and the reader, too, for the matter of that—first falls in love with her. At the age of nineteen she could not have been so delightful a little simpleton, even though she had passed her childhood in a Cumberland dale, and had now been living for some while in a lonely Welsh parsonage. Her talks with the hero are admirable. Her utter ignorance of the conventionalities of society at first annoy him, almost as much as they startle him. The first morning after his arrival at the parsonage he rose early, and went to join her in the garden:—

"Good morning! You have got up early, Mr. Ludlow," she said. "I like people who get up early; but I did not expect that you would do it."

"Why not?" he asked, a little piqued by this reception.

"Because I thought you would have town ways," she replied. "You are not country bred. You are a—" she paused for a moment, and glanced at him rather dubiously, "—a fine gentleman, and fine gentlemen don't keep our sort of hours."

"I don't know why you should brand me as a fine gentleman," Hugh said rather quickly.

"Do you mind being called one?" She stopped her flower gathering, and looked up inquiringly in his face. "I didn't suppose you would. I only said it as an experiment."

"As an experiment!" Hugh repeated.

"I mean, I wanted to see if the shoe fitted."

"Oh!"

And then Hugh felt that he winced a little.

She lets him know that she is not altogether pleased at finding that he was not a boy as she had expected; "I thought," she said, "you would be more of a boy, and awkward, and that you wouldn't know what to do with your hands. It was rather a disappointment." She admits that he may be very nice in another way. "Only when one expects a person to be one thing, and he proves to be something else, it takes a little while to get over it." The chief charm of Dorothy's character in the early part of the story lies in the fact that she "was not boyish in any defiant desire to be so, but only from ignorance, and the circumstances of her bringing-up." She had never had a girl for her friend. The minor proprieties of life were altogether unknown to her; yet there was nothing that she desired more than to learn to be like other girls. "I don't want to be odd; I don't indeed," she earnestly assured the hero. She was always puzzling him as to how he could manage to explain to her the ordinary rules of life, and yet avoid hurting her feelings by showing her that she had broken them. He had been talking one day to her about the theatre, and she had been wondering if ever she should see a play:—

"Perhaps you may. If you ever come up to town, I will get my mother to ask you."

"But I might not like to go with your mother," rather quickly.

"Oh, I would go, too, you know. We would only take my mother with us because—well, because that is how people do things in towns."

"What! take their mothers everywhere with them? Young men?" said Dorothy, opening her eyes wide in surprise.

"No, no, not exactly; that would be too much for the old ladies," Hugh hastened to explain. "But you see, this is how it is; a box holds four people, and if you and my mother and I, and possibly Phœbe, were all to make a party, and fill one together, why, that would look comfortable, and —domestic, you know."

After this kind of talk had gone on for a few weeks, and after the young people had spent their afternoons in rambling together over the hills, the hero, as might be expected, says to himself one day, "Charming as Dorothy is, I couldn't fall in love with her if I tried." The experienced reader, of course, knows very well what this means, and is prepared for a very early proposal. The young lovers soon begin to talk over their plans. Hugh is entirely dependent on his father, and so he tells Dorothy that they must wait three years till he had left college. "They wouldn't let me come there, would they?" she asks. Their courtship was, however, discovered by the too watchful old servant, and the lovers were at once separated. Hugh was forbidden even to write to Dorothy. For three years he remained faithful to her, when, unhappily, he was introduced to the dazzling figure that eclipsed and blotted out for a time, not only poor Dolly, but also our interest in the story. In the third volume we find the old rector dead, and the heroine gaining her living as a daily governess in London. One day she goes to Hampstead, but does not, as we had fully expected, meet the faithless Hugh on the Heath. However, she has to return home by the railway, and in a train many a pair of modern lovers have met. It is, however, not at the end but almost at the beginning of the third volume, that these two thus pick up the thread which was snapped many years before. How, the reader may well ask, is the rest of the story filled up? Partly by a cousin of Dorothy's, who turns up from the gold-diggings, and partly by one of those attacks of typhoid fever to which heroes have become of late almost as much exposed as the members of the Royal Family. Then, too, there is a good deal more lively and pleasant talk, so that the third volume, if it is rather long, is nevertheless not often tedious.

How much do we wish that Miss Craik had had the courage to defy the publishers and the proprietors of circulating libraries, and had given us a story in one, or at most in two, volumes. "Let no man," wrote Tristram Shandy, "say—'Come, I'll write a *duodecimo*.'" If no man can venture to say this, it is not certainly reasonable to expect it of any woman. Nevertheless we cannot but feel regret when we see so much that is delightful greatly injured by being joined to so much that is, to say the least, uncommonly dull. However, we must not end with a word of blame. Dorothy's character is so charming that by itself it would be sufficient to give Miss Craik's story a high place among the novels of the present day; and there are other characters besides, which, though not equally important, are yet very cleverly drawn.

AMERICAN LITERATURE.

ADMIRAL FARRAGUT was the most distinguished of those Southern officers in the Federal service who, on the outbreak of the Civil War, chose to adhere to their flag rather than their State. Professional feeling and instinct might well incline men as honest and high-minded as those who took the opposite course to cling to the service in which they had been educated and had spent their lives. But it was by those who preferred the cause of their native States that the proof of loyalty which self-sacrifice can afford was chiefly given. As Farragut was a sailor and no lawyer, it never seems to have occurred to him that his own State, Virginia, had, in joining the Union, expressly reserved the right to secede at pleasure, and that her own citizens therefore, in fighting to deprive her of this right, merited the name of rebels somewhat better than their antagonists. It is fair to say that he did not manifest the senseless virulence in which many Southern renegades outdid the fiercest abolitionists. Two of the most brilliant and important naval exploits of the war — the forcing the passage of the

Lower Mississippi, which was followed by the fall of New Orleans, and led eventually to the practical severance of the Confederacy, and the capture of the forts defending the harbour of Mobile—were achieved by Farragut, and no name in the service rivalled his either in the estimation of his countrymen or in the opinion of foreign observers. Like most American biographies, the present volume (1) is somewhat heavy, lengthy, and overloaded with despatches and letters of no very material interest. This is the more excusable, however, as the work is written by the Admiral's son, to whom naturally every memorial of his distinguished father was precious, and the material of the larger part at least was furnished by the Admiral himself. It is noteworthy that even a Northern Republican shows a pride of ancestry quite as strong as any Englishman of family could do, and the author takes abundant pains to set forth at length the splendid Spanish pedigree claimed by his family, and dwells with no little satisfaction on the welcome given to his father in the island from which the first of the name who settled in America came, and in which the ancient memorials of the Ferreguts are still to be found.

Whatever impartial observers may have thought of Mr. Garrison's long political career, whatever judgment may be passed by history upon the party struggle in which he took for thirty-five years so active and perilous a share, there can be no doubt of his title to a fuller record or literary monument than this comparatively brief and modest biography (2). Among those political enthusiasts who in the whole field of public affairs can see but the one grievance or evil that has seized upon their own imagination, few have been more sincere, more earnest, or in a certain sense more reasonable, than the first apostle of American Abolitionism. Those who condemned the anti-slavery agitation in the North did so on grounds less applicable to Mr. Garrison than to most of his coadjutors, especially to those politicians who in the later period of his career, and perhaps for purposes by no means so single and pure as his own, came to his support. When he began his propagandist work abolitionism was hardly more popular in the North than in the Slave States themselves. To all who cherished the Union as the basis of that national greatness of which they were proud, the security for the attainment of that magnificent future to which they justly looked forward, the agitation was exceedingly unwelcome. There were many who disapproved of it on higher and stronger grounds than those of patriotic ambition. It was a distinct breach of faith, a lawless interference by the citizens of one set of States with the domestic institutions of their confederates, institutions which, when the Union was framed, had been openly and formally accepted. This indeed Mr. Garrison himself would hardly have denied. He and his party appealed to a higher law, but had the honesty to admit that in so appealing they must forfeit all claims resting upon that lower law whose obligations they violently broke—a doctrine which of course condemns their conduct in the Civil War. It is the earlier part of Garrison's career that will seem in history the brightest, most honourable, and least stained by those insincerities and moral inconsistencies from which few politicians are free, but which are especially censurable in those who, standing aloof from the general issues of politics, cannot plead the politician's excuse of necessity. For many years the life of an abolitionist agitator, even in the North, was one of constant danger and suffering, and might at any moment be closed by what certainly deserved the name of martyrdom. Over and over again were the presses of Garrison and his friends destroyed, their meetings interrupted by angry mobs, their lives seriously endangered. He was certainly not open to the charges justly brought against those politicians who took up the cause when it became powerful and comparatively prosperous. That in the course of his career Mr. Garrison did much terrible mischief, that for a long time he rendered the position of the slaves worse than it had been or would have been but for him, that in his denunciations of slave-owners he was neither just, reasonable, nor accurate, is as certain as that the attainment of his paramount object through means which he did not foresee was in great measure due to the impression which the persistent efforts of himself and other men equally resolute and devoted made upon the conscience, feelings, and passions of the Northern people. In his personal character there was as much to admire, as little to disapprove or condemn, as can well be the case with any man engaged in a fierce and angry controversy involving at once the strongest feelings and the deepest practical interests of those concerned in it. The present memoir is well worth reading, will be heartily enjoyed by those who aided more or less warmly with the objects of Mr. Garrison, may be read with patience by those or the descendants of those whom he most deeply injured, and will interest all who can appreciate dauntless moral and physical courage, displayed amid perils perhaps more trying to nerve and spirit than those of the battle-field.

Mr. Daniels's account of the Huguenot settlement in the Nipmuck Country (3), the township now known as Oxford, Massachusetts, is not a little disappointing. No part of the history of American colonization is more profoundly interesting than the narrative of those fugitives from religious persecution in Europe to whom the original settlement of New England was due. The French Huguenots, moreover, deserve a much more unmixed sympathy than can be given to their English congeners and co-religionists. The latter had suffered far less persecution than they inflicted even in England, had manifested at home a spirit more tyrannical than that of Laud or Strafford, and disgraced their cause in New England by persecutions not less savage and much more senseless than those of the Stuarts or the Bourbons. The French Protestants, partly, no doubt, for lack of opportunity, but partly also from a better and more Christian spirit, are free from this indelible stain on the memory of the Puritans. It is not absurd to speak of them in the terms of praise so ridiculously bestowed on the latter as the champions and martyrs of civil and religious freedom. A clear account of a Huguenot colony in New England would therefore be valuable and interesting, if only from the contrast it would necessarily present to the history of its neighbours. Unfortunately, little or nothing seems to be known of the real story of the French settlers in the Nipmuck country. That they were French Protestants, driven from their country by the revocation of the Edict of Nantes, settled on certain specified lands by a compact between a couple of French speculators in England and certain Puritan grantees of an extensive tract of land in Massachusetts, that they founded a tolerably thriving village, and were driven thence by the Indians—this is almost all that Mr. Daniels can tell us. The story of the French villagers occupies but a very few pages; the rest of the volume contains very uninteresting and unimportant accounts of the squabbles between the grantees and speculators that followed the failure of the attempted plantation. Perhaps the most valuable part of the book consists of a few paragraphs which throw a lurid light on the dealing of the English colonists with the Indian tribes. Savage reprisals may be necessary in savage warfare. They have occurred so often, and stain so equally the dealings of all civilized States with the natives of America, that it would not be worth while to dwell on them. But the deliberate ferocity, the utter contempt for law and justice shown in the execution of Indian chiefs, after a great and regular war, as criminals, is peculiarly characteristic of the temper and ideas of the Puritan administration of Massachusetts and the neighbouring settlements.

Most volumes of the series of *Boston Monday Lectures* contain something that is worth notice from one or another point of view. Perhaps the series of addresses on Labour (4), delivered by Mr. Joseph Cook, is as valuable or as entertaining as any. The latter word is certainly the more applicable to the author's reasoning on the employment of women. That the weaker sex should be, with certain restrictions, permitted to engage in any labour that is not injurious to their health or character is an assumption that will be more generally accepted than the odd condition imposed by the lecturer—that a public authority should be entitled to pronounce what occupations women can safely undertake, and that they should be legally confined to these. But what is still more extraordinary is the cool pretension, not argued but simply laid down, that restrictions imposed on female labourers in the interests of morality or of public health should not interfere with the amount of their remuneration; that is, that employers should be compelled to pay for inferior service at the same rate as superior, because the inferiority is due to the disadvantages at which the weaker sex are placed by nature.

Under the title *Two Sides of the Atlantic* (5) Mr. Burnley gives a sort of half-connected narrative, evidently in large part fictitious, of travel in the United States, sketches of the more familiar aspects of life in American streets, hotels, and villages, with a variety of remarks intended to be comic or sarcastic, but sometimes a little wanting alike in point and in humour. To these are appended, not very appropriately, a set of similar sketches of the life of an English manufacturing town, under the title of "Bradford Night Scenes," which contains perhaps as much that will be new to the ordinary English reader as the Transatlantic sketches.

The Chicago Reporter (6) gives, without intending it, an exceedingly unpleasant impression of the character of that journalism of which he proclaims himself a representative. There is scarcely one of his narratives which could by any possibility have .... in any English newspaper, except perhaps one or two of the worst of those recent imitations of the Transatlantic press which go by the name of "society" journals.

In a simple, modest, brief, and unaffectedly written volume (7) Mr. Myers, a Jewish minister, gives an account of the religious and quasi-religious customs and ceremonies of his people as they now exist, referring by way of illustration and explanation to their past history and to the fuller and very different ritual of

Palestine while the Temple still existed and the strict observance of the law was possible. So little is known, even by most well-informed Christians, respecting either the tenets or the distinctive observances of the most peculiar of all existing sects —a sect which is at the same time a nation, and which derives its creed and ceremonies from an antiquity so remote and so splendid —that this little work ought to be widely popular, as we doubt not it will be in some sense useful. Though the Jews for obvious reasons excite, in England at least, neither the hostility nor the distrust entertained by Protestants for Roman Catholics, or by the Roman Catholics of Continental countries for Protestants, they are still regarded with a sort of cold, ignorant dislike and distrust which, if in some measure explained by their exclusiveness and by their supposed rather than their real business and social characteristics, certainly find no justification either in their religious opinions or in the morality that is connected with them.

Among many valuable works that have issued from the "Riverside Press" of Cambridge, Massachusetts, a complete edition of the known and supposed works of Chaucer (8) deserves especial notice. It is contained in three well-printed octavo volumes, prefaced by a brief, but very useful sketch of the poet's life, works, and times, and a yet briefer and not less useful exposition of the peculiarities of the English of his age. We have also, what will be very welcome to a large number of readers, an explanation of the meaning of those astrological terms with which very few but antiquaries are nowadays familiar.

The fourth annual volume of the Transactions of the American Public Health Association (9) possesses an especial interest and value on account of the records it contains of the late fearful outbreak of yellow fever in the Mississippi Valley. The opinions and even the experience of different writers and practitioners appear greatly to vary. The spontaneous generation or invariable importation of the disease, the utility or inutility of quarantine, the germinal or inorganic character of the virus, are points upon which the most contradictory views are expressed and maintained by evidence collected with equal care, and in equal abundance, on either side. This, however, must be the case so long as the general question of contagion and the origin of specific fevers remains an unsettled question, and will in nowise diminish the interest of the Transactions for professional students.

Dr. Dawson's *Fossil Men and their Modern Representatives* (10) does not deserve the less attention because the author's theories and inferences are on many points somewhat heterodox. He contends, for example, very earnestly against the doctrine which distinguishes clearly and sharply between the Palæolithic and Neolithic ages, insisting that polished and unpolished stone weapons may well have been used at the same time and in the same communities for different purposes, and that, after the introduction of metals, the ruder were likely to survive the finer forms of the antiquated instruments. A special value attaches to that considerable portion of the volume which deals with American, and especially with Canadian, prehistoric antiquities. Here again the author takes a view contrary to that generally adopted by archæologists. He supposes that the prehistoric civilization of America, if not less ancient than is commonly supposed, was not so utterly disconnected with the more modern history of the continent; that the Mound-Builders were exterminated by races still existing at the time of the discovery of Columbus, indeed at a still later period; that not very long before the French and Spanish conquests nations of great power, and much more civilized than the wild Indian tribes with which the English colonists first came into collision, extended over the greater part of what is now the United States; that war and other causes had been continuously for many ages wasting and depopulating the continent. Many of his most important facts and most interesting specimens have been collected from the buried ruins of the forgotten city or town of Hochelaga, an Indian fortress which occupied a considerable portion of what is now the site of Montreal, and was still existing when the first French expedition made its way up the St. Lawrence.

Mr. Theodore Woolsey's *Communism and Socialism* (11) is not more correctly than modestly described by its author as a mere sketch; and the subject is one that can hardly be dealt with within limits so narrow. The volume contains little or nothing that is new, even the existing or extinct communities in America whose various theories, principles, and practices it describes, being known to English readers from fuller and not less trustworthy [illegible].

Dr. Benjamin Taylor's *Summer-Savory* (12) is a collection of sketches of scenery and social life written in a light and pleasant style, which is perhaps most agreeable when it does not aim at professed pleasantry or half-sarcastic humour. The name of Mr. Bayard Taylor is sufficient to secure readers for the collected volume of his poems (13). Dr. Ticknor's posthumous volume of verse (14) is chiefly noticeable for its strong Southern and martial spirit. Few of the pieces possess very striking merit; all are short, simple, and unpretentious.

Of those works which can hardly be called literature in the general sense we have this month a treatise on operative surgery (15), by Dr. Stephen Smith, the surgeon of two New York hospitals; a monograph on the Interoceanic Ship Canal (16) across the Isthmus of Panama; a treatise on the Strength of Wrought-iron and Chain Cables (17); and the convenient and useful American Almanac for 1880 (18), containing a very valuable mass of statistical information.

(8) *The Poetical Works of Geoffrey Chaucer; to which are appended Poems attributed to Chaucer.* Edited by A. Gilman, M.A. 3 vols. Boston: Houghton, Osgood, & Co. London: Trübner & Co. 1880.

(9) *Public Health Reports and Papers.* Vol. 5. Presented at the Meetings of the Public Health Association in the Years 1877–78. Boston: Houghton, Osgood, & Co. London: Trübner & Co. 1880.

THE ELECTIONS.

ELECTIONS enough have already been decided to show what the composition of the new Parliament will be. The great Conservative majority of 1874 has been altogether swept away. The question that remains to be decided is simply with what majority the Liberals will start in office. The Administration of Lord BEACONSFIELD appealed to the country, and the country has answered the appeal by saying that it is tired of the Administration of Lord BEACONSFIELD. In two days' polling the Liberals have gained thirty-one seats. This just reduces the Government majority to zero. In those English boroughs where the result of the polling is as yet unknown there will certainly be some Conservative gains; but there will also be some Liberal gains, and the result hitherto obtained will probably be little disturbed. There remain Scotland and the English counties. Here the gains, whether large or small, must be on the Liberal side. It is the English boroughs that have killed the Government, and it would be very interesting, if only it were possible, to know why they have killed it. To some extent there has been unquestionably displayed a real difference of political opinion. Just as the City of London has pronounced clearly for the policy of the Government, so the North of England has pronounced clearly against it. At Sheffield the Conservatives have had a triumph; but there can be no mistaking the enormous majority for Mr. GLADSTONE and his Liberal colleague at Leeds, the considerable Liberal majority at Manchester, and the rejection of two Conservatives at Salford. In 1877 there was a by-election at Salford which was regarded as in some measure a test case, showing how the Government was standing with the constituencies. A Conservative was returned by a majority of 1800; now two Liberals have majorities of 3,000 over their Conservative opponents. Mr. FORSTER receives a Liberal colleague at Bradford, and Mr. CHILDERS is equally fortunate at Pontefract. Nottingham, which may perhaps be classed with Northern constituencies, replaces two Conservatives with two Liberals, and has returned its chosen candidates by very large majorities. Not that there has been anything like a sweeping revulsion of feeling in the North. In a large number of Northern boroughs the representation is unchanged. Still the voting in places like Leeds, Manchester, and Salford, coupled with the general Liberal success in the North, has justified the confident assertion of Liberal prophets that, at any rate north of the Trent, the tide had turned in their favour. There the simple issue of GLADSTONE or BEACONSFIELD has been fought out, and the North has gone for GLADSTONE.

But what is really remarkable, and what has, we feel sure, taken the Liberals quite as much by surprise as the Conservatives, is that the Liberals have had a triumph all round. They have won in all kinds of constituencies and in all parts of England. They have been equally successful in those boroughs of moderate size which may be taken to represent the average feelings of the ordinary Englishman, and in those smaller boroughs which are usually supposed to be torn by local passions or dominated by local ascendency. In the South and West of England, where they were supposed to be weakest, they have gained Bath, Exeter, Gloucester, Oxford, Truro, and Winchester. In the centre of England they have gained at Bedford, Buckingham, Bury St. Edmunds, Cambridge, Cheltenham, Coventry, East Retford, Evesham, Grantham, Hereford, Ipswich, Kidderminster, King's Lynn, Lincoln, Tamworth, and Worcester. This is a long list, to which, of course, Conservative gains in the same districts might be opposed; but it is not merely that the Liberals have won on the whole, but that, excepting perhaps in metropolitan constituencies, they have won in constituencies big, middling, and small. In the small boroughs they have won Andover, Brecon, Petersfield, Rye, Wallingford, and, more wonderful than all, Stamford, where no Liberal had been returned since the first Reform Bill. A Liberal at Stamford is like a fly in amber, and equally suggests the question how on earth he got there. If the constituencies of all kinds were to give an answer, they could not have given a much more decisive one. But why they have given it no one can exactly say. They have not only given it, but they have given it after the utmost exertions had been made on both sides to get every elector to pronounce an opinion. It is astonishing how heavy the polling has been both in large and small places. For example, at Cheltenham the registered electors are 5,018, and 4,615 polled, and the Conservative who was beaten polled more than he polled in 1874 when he won. At Bedford 2,500 out of 2,600, and at Durham 2,295 out of 2,382, went to the poll, while at Barnstaple, Stamford, and Tiverton more persons appear to have polled than were on the register. In places where there was evidently a very strong current of political feeling it was inevitable that there should be a great increase in the number of persons who would take the trouble to vote. Six years ago a Liberal headed the poll at Leeds with 15,000; Mr. GLADSTONE now heads it with 24,000. At Salford the Liberal voters have suddenly risen from 6,000 to 11,000. At Manchester, Mr. BIRLEY, who was at the head of the poll in 1874, has now polled more than he did then, and yet he is beaten by 4,000 votes. But in little places quite as strenuous efforts have been made as in large ones, and there is scarcely a single constituency which has been snapped by an accidental triumph over supine or disunited enemies. The only conspicuous instance of voters not coming to the poll is the City of London, where scarcely three-fifths of the voters took the trouble to vote, and where the Conservative with the highest figure did not poll nearly half the constituency in his favour.

It is idle to speculate on the causes of the Liberal success. Very probably a large number of electors were tired of the Government merely because it had been six years in office. Another considerable section may have thought that the Liberal leaders, many of whom are men of great personal ability, ought to have their turn and show what they can do. But there are some things that the elections have placed beyond contest. They show that the publicans have not exercised the influence which it was expected they would exercise. At Birmingham they may have been conciliated by the honeyed words of Mr. BRIGHT; but, if they went against him, they did him no harm. The returns also show that the Liberals were not divided by crotchets, that their party organization is much improved, that the Liberals who love Mr. GLADSTONE work hard for him, that the Liberals who distrust him confide in Lord HARTINGTON, and that the moderate Liberals have, as a rule, not gone over or abstained, but have at the eleventh hour voted with their party. No conspicuous politician has as yet lost his seat, the nearest approaches to this being the

rejection of Mr. RAIKES at Chester, and of SIR JOHN LUBBOCK at Maidstone. Both would be considerable losses to the new Parliament, but both are sure to find seats before long. Promising members hitherto unknown to Parliamentary life have been found at Oldham in Mr. STANLEY, at Grantham in Mr. ROUNDELL, and at Oxford in Mr. CHITTY; and that good boy Lord RAMSAY has now an opportunity of showing how good he is, and how quickly he can gain the discretion which will win him the complete confidence of Lord HARTINGTON. As the Conservatives were able to secure a seat at Rochester, it may be regretted that they did not confer on the new Parliament the benefit of Mr. SETON-KARR'S long knowledge of the East, and sound and moderate judgment in all things relating to India. Mr. WREN, who now sits for Wallingford, will perhaps cram Parliament with the zeal with which he has crammed successive batches of Civil servants. At Exeter the eloquence and the influence of Sir STAFFORD NORTHCOTE have sufficed to return his son at the expense of an old friend and a valuable, because honourable and upright, supporter, Mr. ARTHUR MILLS. Sir WILLIAM PALLISER and Sir HENRY TYLER will contribute to the new Parliament special knowledge of a kind that will be generally recognized as useful, and Mr. ARTHUR ARNOLD has travelled and written enough to raise expectations, which may or may not be fulfilled, of his being able to amuse, to instruct, and to excite his hearers at Westminster. Liberals generally will have the pleasure of travelling to Westminster to occupy the side of the House from which they have been so long excluded, and every winning candidate and his friends must rejoice in the result. But in point of personal gratification few perhaps will be able to rival the satisfaction of Sir WILLIAM HARCOURT, who heads the poll, has got an excellent Liberal as his colleague, and has actually defeated a local brewer; of Lord NORTHBROOK, who, after all the criticisms that have been passed on him as Viceroy of India, sees his eldest son at the head of the poll at Winchester; or of Mrs. GLADSTONE, whose dear Yorkshire friends have exerted themselves in a way that she tells them gives her husband much comfort in his present time of trial. A few days more, and the general topic of discussion will probably be, not the elections, but the composition of the coming Liberal Cabinet.

THE METROPOLITAN BOROUGHS.

THE most remarkable circumstance in the metropolitan elections is not that some Conservative candidates are defeated, but that any are returned. The substitution, under the last Reform Act, of household suffrage for the ten-pound franchise effected a smaller change in London than in provincial towns, because the majority of metropolitan householders were already qualified; yet it might have been expected that the new electors, belonging with few exceptions to the humbler class, would have supported the Liberal party. Mr. W. H. SMITH was nevertheless returned for Westminster at the first election after the Act of 1867, at a time when the Conservative cause throughout the kingdom was at the lowest point of depression. It is highly creditable to the constituency that the pre-eminent claim which he has since established to their confidence is fully recognized. The return of his colleague, though he is a respectable and useful member, probably indicates the strength of the Conservative party rather than personal preference. The battle was fairly fought with worthy antagonists. Sir ARTHUR HOBHOUSE, though he is not a popular speaker, has acquired reputation in his profession and in the public service; and Mr. JOHN MORLEY, already eminent in literature and in moral and political controversy, would probably have risen to high distinction in the House of Commons. The city of Westminster still retains some of the characteristics which gave it extraordinary political importance when there were few numerous and independent constituencies. In its wide area it includes rich and poor districts, and many streets of intermediate quality. It would be interesting, if it were practicable, to analyse and classify the votes which were given on either side. The region round Grosvenor Square, including Mayfair, probably contributed to the Conservative majority; but the residents are more conspicuous by wealth and position than by their numbers. The superior tradesmen have during a whole generation gradually undergone a process of conversion from Liberalism, which is perhaps now almost complete; but, even in combination with their richer customers, they must have formed a comparatively small section of the 15,000 or 16,000 electors who voted. The majority of the whole constituency probably live on wages; and many working-men must have supported the successful candidates. There were few collateral issues to impair the political significance of the contest. The licensed victuallers and the customers whose interests are identical with theirs may have preferred the representatives of the party which has threatened them least. On the other hand, it is said that Mr. MORLEY succeeded better than his colleague or his opponents in purging himself from the suspicion of complicity with Co-operative Stores.

It might have been expected that Hackney, with nearly double the number of electors, and without any aristocratic admixture, would arrive at a different conclusion from Westminster. The Liberal candidates were well known and popular, and one of them has deservedly attained a high Parliamentary position. Mr. BARTLEY must be of a sanguine disposition if he hoped in such a constituency to defeat Mr. FAWCETT and Mr. HOLMS. He did a service to his party by proving that in Hackney there were more than ten thousand Conservative voters. The actual or retired tradesmen and others who occupy villa residences in the district have probably joined in the reaction against Liberalism which first disclosed itself twelve or fifteen years ago. The extreme opinions which then frightened large and small owners of property are now more openly avowed; and the fact that the most powerful leader of the Liberal party frequently countenances revolutionary proposals has produced a profound impression on all the classes which have anything to lose; but there are certainly not ten thousand electors of Hackney who live, as the phrase is, on their means. In this instance, also, many working-men and many small tradesmen must have voted for the Conservative candidate. The section of the community which lately prevented the CHANCELLOR of the EXCHEQUER from addressing the constituency is probably numerous; but it is satisfactory to find that it does not include the whole population. It is uncertain whether in Hackney or in other metropolitan boroughs the questions which have occupied the almost exclusive attention of political speakers have greatly influenced the elections. The excitement which prevailed a year ago on foreign policy has rapidly subsided; and probably the results of the different contests represent with approximate accuracy the ordinary strength of the rival parties. In certain classes it is notorious that many former Liberals have temporarily or definitively left their party, principally in consequence of Mr. GLADSTONE'S conduct and language; but the alarm which he has caused is probably not shared by the bulk of the constituencies. In estimating the value of the expression of opinion it is well to remember that every London borough contains a larger or smaller proportion of Irish voters, almost exclusively of the working class. Nearly all of them act under the direction of agitators from Ireland, who have on this occasion used their utmost exertions to return Liberal candidates. It is possible that resentment at Irish dictation may have induced a certain number of English voters to support the party which is not allied with the promoters of Home Rule.

The City of London has an organization and a unity of its own which belong to none of the other metropolitan constituencies. London has been arbitrarily, though necessarily, divided into districts which, with the exception of the City and partially of Westminster, have no necessary independence. The peculiar qualification of a large number of City electors also tends to create a local and municipal patriotism. The citizens of London feel an attachment which is elsewhere imperfectly appreciated to municipal institutions and customs which appear to strangers anomalous and obsolete. The civic aristocracy is, as might be expected, in general, though not unanimously, Conservative. The great majority of liverymen were formerly Liberal; but they care more for their own institutions than for democratic progress. They well know that the establishment of a Metropolitan municipality would deprive the City of its splendour and its privileges, and they accept in earnest

the assurances of statesmen on festive occasions that they will always maintain the rights of the first of English Corporations. In the present election foreign politics have probably had more influence on the result in the City than in other constituencies. Some plaintive Liberal orators still complain of the irregular conversion of an anti-Turkish meeting into an assembly of enthusiastic supporters of the Government. The disturbers were to blame, but they represented the prevailing feeling of their fellow-citizens. For a long time no subsequent attempt was made in the City to oppose the Ministerial policy. For all these reasons it seemed probable that the Conservatives would succeed in returning three members; but so large a majority could not have been anticipated. It is to be regretted that the fourth seat is not occupied by Mr. GOSCHEN, whose personal qualifications for the function of representing a great commercial community are perhaps unequalled. He seems, however, to have acted prudently in declining a contest which might perhaps have resulted in the election of one of the other Liberal candidates in his place.

The return of two Conservative members for Greenwich proves the sound judgment of Mr. GLADSTONE in taking refuge at Leeds in default of success in Midlothian. It also shows that suburban residents have in the borough of Greenwich, as elsewhere, for perfectly intelligible reasons, rallied to the Conservative party. The narrow majority of the Liberal candidates in more than one of the metropolitan boroughs where they have been successful shows that London artisans and tradesmen have not been convinced by incessant declamation of the unsoundness of Lord BEACONSFIELD's foreign policy. The present election will furnish the future Government with matter for reflection when the inevitable scheme of redistribution is introduced. In any arrangement founded on population or on rateable value, London will be entitled to a large increase of representation; and the Liberal leaders will not feel the confidence in new metropolitan constituencies which Mr. GLADSTONE reposes in the admiring voters of Scotch boroughs. The denunciations which he has often directed against London newspapers and London Clubs seem to be in some degree applicable to the mass of London ratepayers, and to the Liverymen of the City. It is probable that the reaction which once more illustrates the caprice of household suffrage under the Ballot would have been still more sweeping if the agitation in Midlothian had not detached large numbers of moderate Liberals from the party with which they have habitually acted. The gain resulting from the excitement produced in Scotland is perhaps not equal to the loss; for it is doubtful whether a single opponent has been won over, though previously formed convictions have probably been confirmed. For the moment the followers of Mr. GLADSTONE and Lord HARTINGTON are entitled to exult in their victory. Comparatively neutral politicians may be excused for doubting whether three changes of Ministry, resulting from three successive elections, prove the steadiness and wisdom of popular constituencies.

THE DECREES AGAINST THE RELIGIOUS ORDERS.

THE blow against the Jesuits has at last been struck, and nobody seems quite sure how much harm it has done them. In point of fact, until five months have passed away, no one will have the materials for being sure. The non-recognized religious orders—with the exception of the Jesuits—have been told to do one thing; the Jesuits have been told to do another thing; and it remains to be seen whether either will do what they are told. Every kind of reason has been given for the action of the Government except the most important reason of all, the motive which has induced them to do as they have done. Upon that point they have been carefully and obstinately silent. It might have been expected that when M. DE FREYCINET made up his mind to set the Senate at defiance he would state in one Chamber or the other why he had determined to do so. Apparently he is so convinced of the wisdom of the course he has adopted that he considers it to need no exposition. The fact that the Senate has decided one thing is in his eyes sufficient ground for deciding the contrary. Otherwise, the least that a co-ordinate branch of the Legislature might have looked for was some explanation why its opinion was not to go for as much as the opinion of the Chamber of Deputies. The Constitution gives the Senate equal powers, and provides that it shall be created by a process differing in detail from that by which the Chamber of Deputies is created, but identical with it in principle. There is no apparent reason therefore why the Ministry should despise the Senate and hold to the Chamber of Deputies rather than despise the Chamber of Deputies and hold to the Senate. Both Assemblies trace their origin to universal suffrage, and though one is in name more popular than the other, it is not clear how they differ in substance. M. DE FREYCINET chose to think that something must be done against the Jesuits, and he proposed the 7th Clause as the least measure which he thought would meet the case. The Chamber of Deputies enthusiastically adopted his views; but the Senate with equal decision rejected them. Considering that both Chambers are elective, this seemed to point to a deadlock out of which there was no way except by a dissolution. Half the elective members of the Senate sit by a mandate of later date than the Deputies themselves; and it is consequently doubtful whether in this instance the vote of the First Chamber interprets the opinion of the country with greater accuracy than the vote of the Second. The power of dissolving the Chamber of Deputies is vested by the Constitution in the President conjointly with the Senate, and it is difficult to suppose that, if M. DE FREYCINET had asked M. GRÉVY to move the Senate to give the requisite consent, the permission to dissolve would have been refused. Had it been refused, M. DE FREYCINET would have been clearly in the right. The Senate and the Minister would have differed as to the interpretation to be put upon the popular feeling, and the Senate, not the Minister, would have shrunk from verifying theory by an appeal to facts. As it is, the Minister has shrunk from this decisive ordeal. He has rested content with a majority in the Chamber of Deputies as elected in 1877, in total disregard of the later date at which the contact of the Senate with the electors has taken place. In short, he has acted as though the existing Constitution of France provided but a single Chamber, and the addition of a second were merely ornamental. We know of no country in which there is a second elective Chamber where the voice of that Chamber would be so entirely set at nought as the vote of the Senate has lately been in France. Even in the colony of Victoria there has been a dissolution, and a dissolution with the result that the impression generally entertained of the issue of the elections has been completely falsified. In France alone the Second Chamber has been openly defied. The next time that the Senatorial elections are held it will not be wonderful if the electors bethink themselves how little attention has been paid to the previous expression of their opinion.

M. DE FREYCINET has said that, if the Senate would have passed the 7th Clause of M. FERRY's Education Bill, the Government would have asked no more. From this it appears that the one point which the Government were anxious to secure was the exclusion of members of the non-recognized religious orders from the exercise of the teaching function. Let it be conceded that this object will be obviously attained by the decrees which have just been issued; what is the gain which it is supposed will accrue to the Government in consequence? When the Jesuits and all the other non-recognized religious orders have been satisfactorily got rid of, to what body will the education of the children of whom these Orders have hitherto had the charge be made over for the future? The Radicals seem to assume that in this matter the parent counts for nothing. He has sent his son to a Jesuit school instead of to a lycée up to this time, and for the future he will send him to a lycée instead of to a Jesuit school. Why should he do anything of the kind? Because, it will be said, the Jesuit school will be closed by order of the Government, and consequently he will have no alternative but to send him to a lycée. This view of affairs seems to credit French parents with exceedingly little inventiveness, and French Catholics with a strange want of ability to adapt themselves to new circumstances. The reason why the Jesuit schools have been popular is, in part, that they are supposed to follow a more rational system than that followed in the lycées; in part, that the parents like the religious teaching given in these schools; and in part that parents expect, either in their own persons or in those of their children, to reap some advantage from giving the Church the preference over the State. It is not likely that these motives will cease to operate immediately upon the execution of the new decrees. The lycées will not become any better from

the withdrawal of competition. The desire that children should receive religious training of a specific kind will not be extinguished. The influential or fashionable classes which have hitherto supported the Jesuit schools will not transfer their countenance to the institutions which they have so long been decrying. Nor is it probable that the Church will be found wanting when means have to be provided for giving effect to these feelings. If it were necessary, we should no doubt hear that this or that eminent teacher had retired from the Jesuit Order, had been admitted into one of the orders recognized by the French Government, and was about to open a school in such and such a street, and under such and such patronage. It is not at all clear, however, that any such necessity will arise. The law on which the decrees are founded is by no means easy of interpretation, and it is quite possible that the Jesuits may find it so easy to evade dissolution that they will be under no temptation to exchange into an order which has not been dissolved. Even if it could be supposed that, as regards the Jesuits themselves, the decrees would have the tremendous force which the Ministerial Radicals are disposed to attribute to them, the same teaching would continue to be given by other teachers. It is not the instructions of a particular body of schoolmasters which has made a large number of Frenchmen reactionary and Ultramontane. That they are so is the result of a great variety of influences; and, as long as these influences continue to operate, the result will continue to be observed. This particular attack upon the Jesuits will only arm the reactionary and Ultramontane section of French society with a very much better argument than any they have had yet. They have been predicting for years that the Republic would in the end attack the Church, and they are now for the first time able to point to facts in support of their opinion. There can be few worse policies than to fulfil the predictions of an adversary.

MR. GLADSTONE.

THE deluge of Mr. GLADSTONE's speeches has continued without abatement to the end. Within two or three days of the election he delivered several orations, of which perhaps the most significant was a short address to the electors of Peebles. Forgetting, or not regarding as serious, the repeated professions of Lord HARTINGTON, he intimated his determination to abandon two of the territorial acquisitions which have been made since his retirement from office. He undertook to repudiate the possession of Cyprus and of the Transvaal as dominions both worthless in themselves and discreditable in the circumstances of annexation. Both questions deserve grave consideration; but it is not the duty of a statesman to decide such issues without reference to accomplished facts or consultation with his colleagues, or to announce his conclusions for the purpose of exciting applause to the first mob which he may casually meet. Other Liberal leaders have of late repeatedly pledged themselves to accept the responsibility of the Eastern policy of Lord BEACONSFIELD's Government, including the acquisition of Cyprus. Lord CARNARVON, who is habitually courted by the Liberal party, suppressed the Transvaal Republic, and appropriated its territory; Lord KIMBERLEY, who was Secretary for the Colonies in Mr. GLADSTONE's Cabinet, approved the annexation; and Mr. FORSTER has more than once protested against the abandonment of the native inhabitants of the province to the mercy of the Dutch settlers. No serious Parliamentary opposition was offered to the measure except by Mr. COURTNEY, who found no support in his vigorous and consistent opposition to Lord CARNARVON's policy. It is a natural inference from the thoughtless communication made to the Peebles audience that Mr. GLADSTONE will, in the event of his accession to power, hold himself at liberty to repudiate more important engagements than those which relate to Cyprus and the Transvaal. His possible colleagues or clients must rejoice at the close of his circuit of declamation.

On Monday Mr. GLADSTONE's torrent of eloquence had temporarily subsided into a placid current. Instead of violently denouncing his enemies, he was friendly, familiar, and communicative, even in personal details. By the advice of a physician, who is, as might be inferred from his rare sagacity, a Scotchman, Mr. GLADSTONE has, it seems, the habit of applying suitable remedies as soon as he feels himself indisposed. So admirable a practice accounted for his being perfectly well on Sunday, though he had been a little disordered on Saturday. The cheerfulness of rapid convalescence was only disturbed by a supposed calumny which he was characteristically eager to correct. A local caricaturist had added to a picture of Mr. GLADSTONE a legend to the effect that he had no support except at Dalmeny, which is Lord ROSEBERY's residence. The facetious artist had, it seems, placed the statement between inverted commas, and Mr. GLADSTONE, shocked at the cruel mendacity of the libeller, denied that he had said anything of the kind. Future biographers will take notice that Mr. GLADSTONE neither sells cheap claret nor wantonly contradicts his own repeated boasts that he has a majority in Midlothian. He found a pleasanter topic in the candidature of one of his sons for Middlesex, which is of course intended as a compliment to himself. He naturally conjectured that the metropolitan county of England was actuated by a desire to imitate the mid or central county of Scotland. Mr. HERBERT GLADSTONE's inexperience accounts for a declaration which probably represents higher authority than his own. He said in one of his speeches that he desired to support the English Established Church, but that, if the majority were of an opposite opinion, he would not attempt to thwart their wishes. As Mr. GLADSTONE has frequently used similar language in speaking of the Scotch Establishment, there can be little doubt that the candidate for Middlesex has inadvertently expressed his intentions.

No inference can be drawn from Mr. GLADSTONE's silence as to the course which he will follow if his party returns to office. Mr. FORSTER was apparently not in his confidence on the subject when he lately said, with obvious truth, that the only possible Prime Ministers of a Liberal Government were Lord GRANVILLE, Lord HARTINGTON, and Mr. GLADSTONE. He added that, if Mr. GLADSTONE chose to accept the office, neither of his former colleagues would dispute his claims. Such a competition would be equally unwise and ungracious; but the leaders of the party will, if the occasion arises, await Mr. GLADSTONE's resolution with serious anxiety. His accession to power would reduce to insignificance the moderate Liberal party. He might possibly be once more willing to leave to Lord GRANVILLE the ordinary conduct of foreign affairs, though the national policy would be liable to disturbance through the sympathies and antipathies which Mr. GLADSTONE has recently cultivated. On all domestic questions he would be practically supreme. His most devoted admirers scarcely exaggerate his paramount influence over the most numerous section of the Liberal constituencies. An impulsive and passionate character becomes popular through the very defects which impair the confidence of colleagues and of Parliamentary followers. A Cabinet controlled by such a Premier must be prepared to join him in agitation for any of the thirty measures which he lately announced as necessary and urgent. The other alternative which he may perhaps choose will also be a source of embarrassment. Out of office Mr. GLADSTONE would still be regarded as the leader of the party of movement; and there is no room in the English constitutional system for an irresponsible patron of the Government. Lord GREY expresses a feeling of uneasiness which is widely entertained in his anticipation that the policy of a Liberal Government will be directed by Mr. GLADSTONE, whether he is in or out of office. The revolutionary tone and temper of his Midlothian speeches, both in the autumn and in the spring, are even more alarming than his special opinions on domestic and foreign policy. In an answer to Lord GREY which showed good taste and good feeling, Mr. GLADSTONE concurred in the opinion that his own possession of power without responsibility would be injurious to the public interest; but he suggested that the independent characters of Lord GRANVILLE and Lord HARTINGTON would furnish a sufficient security against their dependence on himself. It is nevertheless certain that a Liberal Ministry would be deserted by the Radical members of the party if it were on any question opposed by Mr. GLADSTONE. In defending himself against Lord GREY's charge that he had propounded revolutionary doctrines, Mr. GLADSTONE made no reference to his mischievous suggestion that Parliament might justly expropriate landowners for the purpose of creating bodies of peasant proprietors, if such a measure were economically desirable.

If any orator can make financial speeches attractive, Mr. GLADSTONE has almost exclusive possession of the secret; yet it is difficult to suppose that his large audience at Stow was either entertained or convinced by his elaborate

manipulation of figures. Even a Scotch tradesman or artisan can scarcely pretend to hold a confident opinion on the comparative merits of the different methods which have been employed in the reduction of the National Debt. Terminable Annuities, once created, are, as Mr. GLADSTONE said, self-acting. On the other hand, Sir STAFFORD NORTHCOTE'S Sinking Fund, as long as it is maintained, is more effective and more economical. If the Stow meeting preferred the plan of Terminable Annuities, its judgment must have been formed not by the force of Mr. GLADSTONE'S arguments, but on his authority. There is no doubt that he has been a great financier; but his judgment on financial as on political questions is impaired by prejudice and passion. In the course of his financial speech he thought fit to introduce an episode on the advantages of democracy as illustrated by the success of the American Government and Legislature in reducing the debt. Mr. GLADSTONE never spares adulation of the United States, probably as a set-off to his famous eulogy of the Confederate Government. If an aristocracy or an English Ministry were to support a strict protective system and an irredeemable paper currency, and if it had borrowed the whole amount of the sums required for the most costly war on record, Mr. GLADSTONE would not be so complimentary in his criticisms. It is not the business of Englishmen to find fault with the financial policy of foreign countries, except when they are for party purposes proposed as models for imitation. The advantage of rapidly reducing the interest of the American debt has been purchased by the payment, up to the time of commutation, of an extravagant percentage; but the Treasury and Congress had a full right to choose the course which might be most convenient. The whole of Mr. GLADSTONE'S latest financial argument was vitiated by his habitual confusion of finance with politics. It has never been denied that Lord BEACONSFIELD'S Government has spent more and received less than Mr. GLADSTONE'S. It follows that the debt cannot have been as rapidly reduced as if no change had occurred. The cost of the Indian troops at Malta, of calling out the reserves, of keeping a large fleet for many months in Turkish waters, had in some way to be met. The choice of means was a question exclusively of finance; the amount to be provided was wholly dependent on national policy. Mr. GLADSTONE mixes up the two separate issues so constantly that he must be supposed to delude himself before he misleads his followers. Before the production of the Budget Mr. GLADSTONE and his adherents frequently challenged Sir STAFFORD NORTHCOTE to impose taxes for the immediate discharge of an accumulated debt of seven or eight millions. They can hardly have expected to tempt the most simple-minded of adversaries into a suicidal decision on the eve of the general election; but it was hoped that discredit would be thrown on the Government by its admitted inability to pay off the debt. When it was announced that the payment would be spread over five years, the decision of the CHANCELLOR of the EXCHEQUER commanded general approval; and from that time the majority of Liberal speakers have judiciously avoided the question of finance.

THE AUSTRIAN OCCUPATION.

ONE of the minor trials to which quiet Englishmen are continually exposed is that no one seems able to speak or write about any subject connected, however remotely, with the Eastern Question, in simple and natural English and in a guarded and unbiassed manner. Mr. ARTHUR EVANS has been writing on the Austrian occupation of Bosnia and Herzegovina, and if he would but have confined himself to what he knows and has seen, his contribution to the *Fortnightly Review* would have been equally welcome and valuable. He is one of the very few Englishmen who have lived and travelled in the remote and savage districts of which he speaks. It is impressive, to say the least, to peruse the composition of a writer who can say what he saw at Kulen Vakup, who has received the confidences of a Vakup Beg familiarly known as Fat ALAJ, and has discussed with a Serbian gentleman the probable spread of the Russian language south of the Danube. To get at facts and put away theories, fears, and prejudices is, after all the interminable discussions with which we have lately been made familiar, the only method of dealing with the Eastern Question which is of the slightest real use. Mr. EVANS does give us some facts, and so far we may be grateful to him; but he is cursed with a turn for epigrams and eloquence, and he keeps breaking out and bewildering us when we most fondly hope that we have got him safe and that he is going to instruct us. He takes up his parable against Austria, and thunders away in that flowery historical style which is so distracting. "From the days of the hyæna of Prague "to the days of the hyæna of Brescia the policy of the "HAPSBURGS has been essentially the same," and so forth. Oh! for one hour of blind old DRYASDUST, who at least, if we went through the intense nuisance of reading him, let us know more or less what he meant. Even when we do know what Mr. EVANS means, we too often have to listen to nothing but screams of passion. Count ANDRASSY, we are told, in accepting the task of occupying Bosnia, served his sovereign and betrayed his country. Why should we not say that Count ANDRASSY served his sovereign and took the line he thought best for his country, although a visitor to Kulen Vakup and a friend of Fat ALAJ thinks he judged wrongly? If we could simply put aside the writer's impassioned utterances and stick entirely to his facts, no great harm would be done. But facts are only what a man sees or hears, and it is he that brings the eye and the ear to the task of collecting information. We cannot be quite easy about the eye and ear of an observer whose mind was tossed with thoughts of the hyænas of Prague and Brescia, and who was perfectly positive that Count ANDRASSY had betrayed his country.

Taking into account the furious prepossessions of Mr. EVANS on the one hand, and his indisputable knowledge of the country on the other, we find the following facts in his article for our consideration. To the credit side of Austria's account there stand some items of considerable importance. She has overthrown for ever the tyranny of Pashas and Kaimakams; she has abrogated the whole iniquitous system of tax-farming; she has removed the religious disabilities that weighed upon the Rayah; and she has terminated the wholesale murder and outrage of a reign of terror. On the other hand, the debtor side is heavy. Austria governs through an alien bureaucracy and soldiery; the provinces are more heavily taxed than they were under the Turks; the Serbs are persecuted for being Serbs; an agrarian system which they detest has been reimposed on the cultivators of the soil; and the refugees who had fled to Austria were sent back with so much cruel negligence that nearly one-half of them perished. The general result is stated by Mr. EVANS to be that their Austrian rulers are equally detested by Mahommedans and Christians, and that in despair numbers have taken to the hills, and live, or try to live, by brigandage. As illustrations of the tyranny of an alien bureaucracy, we are told that the Serbs are not allowed to have the benefit of the old Cyrillian characters being used in public documents, and that telegrams complaining to the EMPEROR of local officials are burked in the offices from which they are supposed to have been despatched. Cemeteries have been converted into public gardens, and rows of houses have been knocked down for street improvements without compensation to the proprietors. The Serbs are persecuted for being Serbs in different ways. In the first place, they are not allowed to call themselves Serbs, which must no doubt be trying. German is to be made obligatory in the higher schools. The masters are to be corporals in the army. Under these circumstances the Serbs are beginning to try to make their own language more like the Russian. Not that they have the slightest wish to fall politically into the hands of Russia. "The memories of their own ancient Czars, of "SAMUEL and STEPHEN, effectually withhold their alle-"giance from the Russian autocrat." But in the midst of their misery and brigandage they seem to have literary aspirations; and, as they have not much of a literature of their own, they feel obliged to import one, and fancy that the shades of SAMUEL and STEPHEN would smile more blandly on the introduction of Russian than on that of German learning. We imagine that they are right, and that SAMUEL, at any rate, would hardly have been up to GOETHE. The tenure of land under the Turks was what is known in books of political economy as a metayer tenure. The holder of the soil paid to the proprietor one-third of the crops. This tenure has been reimposed, or, at least, the Austrians have done their best to reimpose it. The proprietors are mostly Mahommedans, and the holders Christians; and the

Christians hoped in their sanguine way that Austria would terminate the old tenure by the simple process of letting the holders have the land and pay nothing for it. In this they have been disappointed, and they feel their disappointment keenly. The repatriation of the refugees was managed, unless Mr. EVANS is more mistaken than it is possible to believe him to be, in a most clumsy and heartless way. The poor wretches were driven over the border to starve and die in the snow. Austria had given them but very scanty hospitality while she allowed them to remain on her soil, and carted them into the wilderness when she wished finally to be rid of them.

The main conclusion at which Mr. EVANS arrives is that Austria does not deserve to be promoted to the office of protecting any more Slav nationalities, that it would be very dangerous for her to go forward to Salonica, and that she should be restrained by other Powers, and especially by England, if she showed any signs of moving in that direction. It is easy to agree with him that Austria would be guilty of the height of folly if she trod in the dangerous path of adventurous annexation; that the subject nationalities of Turkey do not wish to pass under the domination of Austria, and that it certainly is not the business of England to exert the influence she may justly claim to possess in favour of an alien and aggressive Power. But Mr. EVANS does not appear to us to do anything like justice to the disinclination of the Austrians themselves to become aggressive or adventurous. The occupation of Bosnia and Herzegovina is looked on in Austria as a sad necessity. Austria could not go on any longer with the tyranny of Pashas and Kaimakams on her border. She did not see any way of making this tyranny cease except by occupying the provinces. If the inhabitants had been left to themselves, they would have simply cut each other's throats. To have handed them back to Turkey, and merely pledged the Turks to reform, would have been an idle and cruel mockery. In carrying out the undertaking forced on them, much against their will, the Austrians have done some things well and some things badly. The Rayahs entirely declined to be content with anything short of being allowed such a domination over the Mahommedans as the Mahommedans had been used to exercise over them. No honest and civilized Government could have permitted this. The first basis of good administration is to do justice to every one, and nothing could have been more unjust than to alter by a stroke of the pen the whole tenure of property, and to confiscate the lands of Mahommedans in order to please Christians. That the Austrians, on the other hand, have not unjustly sacrificed Christians to please Mahommedans is shown by the statement of Mr. EVANS that the Austrians are equally detested by both. It may further be observed that even Mr. EVANS, although his brain is teeming with HAPSBURG hyænas, does not appear to have noticed that the inhabitants of the provinces had any reason to complain of the Austrian soldiery. There may have been displayed civilian harshness, but not military cruelty. That the Austrian bureaucracy has not been very genial or accommodating, and that it has gone on in its usual vexatious bureaucratic way, is highly probable; but these are faults of all bureaucracies, and Austria had no other machinery of administration than its bureaucracy to employ in introducing good government. After reading all that Mr. EVANS has to say, we may still think that the Austrian occupation was better for the provinces than anything else they could practically get, and that, while they have done some good by their occupation, the Austrians are not to be severely blamed for such evils as may have accompanied the accomplishment of their work. At the same time, as it was Europe that invited Austria to go into Bosnia and Herzegovina, it is clearly beneficial that Europe should watch what she does now she has got there, and should learn to distinguish between a case where an Austrian occupation was the least evil open to choice, and cases in which an Austrian occupation would be as unjust and unnecessary as it would be ruinous to herself.

AMERICAN POLITICS.

POLITICAL like social fashions inevitably wear out; and the people of the United States no longer attach absorbing interest to Presidential elections. The policy and prosperity of the Union will be but imperceptibly affected by the result of the contest which is now languidly beginning. The Republicans and the Democrats will find it difficult to promulgate distinctive opinions for the purposes of the canvass; and the President who may be elected will be neither able nor willing to exercise any controlling influence over public affairs. There is every reason to expect that the protective tariff will be maintained, and that the currency will be neither secured by the abolition of paper money as a legal tender nor depreciated by excessive coinage of silver. The interference of Federal troops with State elections has ceased to raise any practical question; and Civil Service reform seems destined to be indefinitely postponed. Except to professional managers of elections, it matters little whether Republican supremacy is to be at last interrupted; and probably the internal contest for nominations will excite more interest than the ultimate election. Among the Democrats only two or three names have been mentioned; and the hope that Senator BAYARD may detach a few votes from the Republicans is probably chimerical. Mr. TILDEN has at last informed his followers that he is still a candidate for the Democratic nomination; and probably he will be preferred by his party to any competitor. He seems to have established a claim to support by his success in obtaining a majority of votes at the last election, though he was deprived of the fruits of victory by the frauds of Southern Republican agents. Charges of personal dishonesty, which were preferred against Mr. TILDEN by his opponents, were properly disregarded as ordinary incidents in a nearly-balanced contest. Foreigners are sometimes surprised at the readiness of American orators and journalists to prove that a candidate who may possibly become a President is a notorious swindler; but they are probably aware that their calumnies are not even provisionally believed.

A few scattered purists raise a plausible objection to all the candidates for the Presidency. None of them are supposed to be specially opposed to political corruption as it is ordinarily practised by party managers. Mr. TILDEN, Mr. BLAINE, and Mr. SHERMAN have attained high positions in their respective parties by their skill in manipulating special interests and in managing elections. General GRANT's last administration was discredited by the constant disclosure of official frauds, in some of which members of the Cabinet were engaged. There is little use in vague aspirations to theoretical purity. It is scarcely possible that any American politician should have become conspicuous enough to be a candidate for the Presidency, except by compliance with the conditions on which success in public life depends. There is no reason to believe that the Republicans in general think worse of Mr. SHERMAN because he has employed the subordinate officers of the Treasury throughout the Union to act as his election agents. It is true that the PRESIDENT forbade by proclamation any such employment of public servants; but Mr. HAYES was not a candidate for re-election. Mr. BLAINE, who seems to obtain more votes than Mr. SHERMAN, is a politician of the same class. None of his supporters doubt that, if he becomes President, his patronage will be used to reward their services. It must be difficult to cultivate or even to affect enthusiasm for candidates possessed perhaps of more than average ability, but representing no intelligible cause or principle, while they profess exactly the same opinions, which indeed are also held by their Democratic opponents.

Over his competitors of both parties General GRANT enjoys the great advantage of personal distinction. If he was not an especially scrupulous or efficient President, he had previously been a successful commander, and he has since contrived to obtain recognition in foreign countries as the most eminent of living Americans. The objection which was first raised to a second re-election, or to a third term of Presidential office, has lost its force as the proposed innovation became familiar. It is argued that reappointment after an interval is not liable to the objection that a President is tempted to use the powers of his office for his own benefit. The interval of four years has been sufficient to enable General GRANT to detach himself from associates or dependents with whom a connexion might be objectionable. It is difficult for foreign observers to test the accuracy of the statements which are made by General GRANT's supporters and opponents. The first State Convention which decided in his favour was that of Pennsylvania, which was managed by the well-known CAMERON family, probably not in the interests of political or official purity. A majority of the Republican delegates of New York was also secured; but other Northern States have hesitated, and there are no

indications of the enthusiasm which might have been expected to welcome his candidature. The nominations of GRANT by Republican Conventions in two or three Southern States will have little ultimate value, because the votes of their Presidential electors will almost certainly be given to the Democratic nominee; but they may count for something in the Republican Convention. The partisans of General GRANT still assert that he will be nominated at Chicago in preference to Mr. BLAINE. Mr. SHERMAN has a much smaller following; and it is thought that his adherents may ultimately vote for GRANT. Before the canvass began sanguine partisans hoped that GRANT's supposed popularity would give him the votes of one or more Southern States; but it is now understood that the Democrats will control all the Southern votes, and that, if they can secure New York and Ohio, they will elect a President. On the whole the chances incline to the Republican party, and among their candidates to General GRANT, though he has not been chosen, as his friends had hoped, by popular acclamation. It is not impossible that if GRANT is elected he may disappoint both his opponents and his partisans. He is shrewd and determined, and although he formerly gave way to the professional politicians of the Senate, he is now equal or superior to any rival in practical experience. It would be greatly to the interest of a President to break through the less creditable traditions of the office. It is not impossible that a reform of the Civil Service, rendered practicable by an appeal to the patriotism of the people, might procure for General GRANT a fourth term of office.

As far as it is at present possible to judge, the future President may hope to hold office in prosperity and peace. The revival of trade in the United States is both more rapid and more certain than on this side of the Atlantic; and the incessant strikes which derange particular branches of industry have for the most part been justified by a success which is in itself a proof of commercial and industrial prosperity. In all countries the Government for the time obtains a certain amount of credit from the prevalence of good fortune among the community. There will also be opportunities of appealing to popular vanity. The actual PRESIDENT, though he is not of a blustering disposition, has taken occasion to proclaim a new doctrine of international law, which his successors will probably consider themselves bound to maintain. It seems that the MONROE doctrine, which took its origin in a short-sighted suggestion of CANNING's, has now grown into a claim of sovereignty for certain purposes over the whole American continent. When M. DE LESSEPS first proposed to unite the Atlantic and Pacific Oceans by a canal, he was warned that his enterprise would fail unless it received the sanction of the American Government. It mattered comparatively little whether the President and the Congress had a right to interfere with a scheme which they had the power to defeat. No prudent capitalist would provide money for the construction of a canal which could scarcely be constructed without the permission of the American Government. The PRESIDENT and the SECRETARY of STATE now assert that the work must become American property, though a treaty exists by which the United States and Great Britain undertake to guarantee the independence and neutrality of an inter-oceanic canal. It is perhaps fortunate that the projector is a Frenchman, and that the work itself may possibly be indefinitely delayed. In the meantime it will be desirable to abstain, if possible, from disputing a pretension which it may be ultimately necessary to admit. The MONROE doctrine was sufficiently valid, when backed by threats of force, to compel NAPOLEON III. to withdraw the French army from Mexico. It would be difficult to protect a Panama Canal against American troops and ships. The Federal Government might find a shadow of precedent for its claims in the more moderate pretensions of Great Britain to the free use of the Suez Canal. It cannot be denied that, if M. DE LESSEPS's scheme were accomplished, it would be largely used for the coasting trade between the Atlantic and Pacific shores of the United States. The communication would be at least as indispensable to the American Union as the free use of the Suez Canal to the Power which possesses India.

THE BRIGHTON REVIEW.

THOSE who maintained, amidst the foolish sneers and equally foolish praise of which the Volunteers were once the subject, that the movement had real stuff in it, have good reason to be satisfied with the evidence that time has yielded of the truth of their theory. The Brighton Review was in its infancy a mere monster excursion, and, what was worse, it was constantly maintained that a monster excursion was all that it was possible to make it. When it was objected that volunteering had been set on foot for military and not social ends, and that, if these military ends were habitually neglected, there might as well be no Volunteers, some unwise friends of the movement resorted, by way of answer, to gushing declamation about the advantages of exercise and the charms of good-fellowship. If a force which had in it the making of good soldiers could have been spoiled by newspaper folly, volunteering would by this time have been reckoned among extinct crazes. The review of last Monday was in all respects a most satisfactory contrast to its predecessors. The fact that it is separated from the last of them by so long an interval makes this improvement the more conspicuous. Of course the sham fight on the Downs was not a very striking example of the military art. Sham fights in England seldom are so, even where the combatants are regular troops. The national regard for private property stands very much in the way, and the prescription in favour of Volunteers, though it is growing, is yet a long way short of the prescription in favour of fox-hunters. Regiments in different stages of efficiency can hardly be expected to show to the best advantage on the one day in the year on which they have an opportunity of acting together. But in the Brighton Review there are more important things than the sham fight. The conditions under which it takes place are certain never to be paralleled in real warfare. The Volunteers would then be differently brigaded and differently led. The change which is so encouraging in the proceedings of last Monday is the change in the whole bearing of the regiments which took part in them. On the Sunday, when a large number of Volunteers were quartered in the town, Brighton seems to have presented a wholly different aspect from that which it wore on the corresponding day in former years. The Volunteers have learnt that while they are in uniform they ought to be subject to all the restraints to which regular soldiers are subject. They have come to Brighton to learn, so far as is possible in so short a time, what soldiering is really like, and it is only by seizing every occasion of study which is presented to them that they can do this to any purpose. Even in the hardest campaigns there is a good deal besides fighting to be done, and these secondary, but not unimportant, aspects of a soldier's life may be better studied perhaps at Brighton than the more purely warlike side. Endurance of unaccustomed hardships, punctuality, subordination of amusement to business, observance of discipline when not actually under arms—these and the like are the qualities in which the Volunteers seem to have gained so greatly; and, if they had never marched to the Downs at all, their improvement in these respects would have given their real well-wishers the best possible ground for satisfaction. The Volunteers cost the country something, and the country has consequently a right to ask what return it gets for its money. Reviews such as those of Monday last supply a most encouraging answer to this inquiry. The Volunteers constitute a second line of defence of very genuine value. It may be hoped that the navy will never be so far neglected as to give an enemy the opportunity of testing what this second line is worth; but we may assume that the chances of an invader's success have been appreciably diminished by the progress which the Volunteers have made since the days when the publication of the *Battle of Dorking* first startled people into considering what amount of protection the force was likely to afford.

The Brighton Review of 1880 shows very plainly under what treatment volunteering best prospers. For some years past there has been no disposition on the part of the military authorities to accord the Volunteers any undue favour. They have been told a good many useful truths, and taught to do without the flattery which it was at one time the fashion to bestow on them whenever they performed the simplest military duty without breaking down. It has been seen that the War Office meant business, and the

Volunteers have had the good sense to see that to mean business was the best compliment that the War Office could pay them. A notion used to prevail that the Volunteers needed to be coaxed into doing even the minimum of work required of them, and that the best form which coaxing could take was the reduction of that minimum to the lowest possible point. No theory could be more short-sighted. Even if some men would have been induced to become Volunteers by the prospect of having nothing to do except march out with their corps when they happened to want a little gregarious exercise, at least as many would have been kept out of the force by the certainty that there was nothing to be learnt by joining it. If the numerical losses from this cause had only equalled the gains, the result to the movement would have been disastrous. The men who would have been kept out would have been the men it was important to gain; the men who would have been tempted in would have been men whom it was better to lose. In proportion as the demands made on the Volunteers have grown, their numbers and their diligence have steadily increased. Many have joined them when they saw that they were expected to make themselves soldiers, so far as the time they could give to the work allowed, to whom playing at soldiers would have had no attraction whatever. If some foolish friends of the movement had been listened to, volunteering would by this time have died out. Its strength has lain in the fact that in its later stages it placed before the Volunteer recruit a standard of efficiency which it was worth while taking some trouble to attain. The accounts of the march past on Monday show a degree of proficiency which can only have been secured by considerable practice, and when the first novelty has worn off considerable practice means considerable self-denial. Drill may be pleasant enough when a man is at it; but a Volunteer does not become qualified to take his part in a review such as that of Monday without going to drill a good many times when he would rather be somewhere else.

The London and Brighton Railway Company has apparently profited by the long interval which has elapsed since the last review on a great scale. The punctuality of the whole service was remarkable, and allowed the programme of the day to be carried out with exceptional accuracy of detail. Considering how large a part railways now play in warfare, it is a pity that Volunteer reviews are not more turned to account by way of practice. Unfortunately the interests of the Companies very often conflict with those of the War Office in this matter. The Companies want to be carrying pleasure-takers on the very same days on which the War Office wants them to be carrying Volunteers. The burden falls with peculiar severity on the London and Brighton Company, because Brighton can only be approached by that line, and the town is especially convenient for Volunteer reviews. Notwithstanding this latter fact, there seems no adequate reason why Brighton should always be chosen. As much may be gained by learning how to dispense with conveniences as by learning how to make the most of them. If ever the Volunteers should be called out for active service, the enemy would not arrange his movements with any regard to facilities either of transit or of commissariat. At least the facilities consulted would be exclusively his own. It would be well that the staff of other Companies besides the London and Brighton should have the benefit of an experience which in England must be gained from the Volunteers or not at all. It is not expedient that the Government should ever appear in the character of a disappointed suitor for a Company's favours, and statutory powers might very well be taken to compel all railways to carry Volunteers on one of the summer Bank holidays, with proper provisions against an undue share of the burden being thrown on any one Company. Those Companies which do not command the accommodation of all kinds which is furnished by the Brighton station would thus be trained in the art of making the most of what is to be had at the station chosen on military grounds to be the scene of the review. Though the number of the Volunteers present at a review under these circumstances might be less, the benefit to the officers would be decidedly greater.

ELEMENTARY TEACHERS.

THE week of a General Election is an unhappy occasion for the meeting of a "Conference." When these interesting gatherings are held in the autumn the newspapers are glad to give them a prominence which is measured chiefly by the absence of other matter. In September the three days' meeting of the National Union of Elementary Teachers, which seems to have been going on at Brighton since Monday, would have filled an equal number of columns on each of the three days. As it is, we are left in doubt whether the proceedings extended beyond the first evening. The President's address, however, would alone give the public ample matter for reflection, if just now they had time to reflect. The growing incongruity between the machinery and the object of elementary education was never more strikingly shown. Everybody knows in a rough sort of way what the education of the poor is in practice. Children go to school when they are about five years old, and the great majority of them leave school when they are about twelve. In this interval, if their attendance is regular and the teaching good, they learn to read fairly, to write not very badly, and to know enough of figures to carry them through the calculations of ordinary life. In addition to this, they learn such things as can be conveyed to them through the books which they must read for practice, and as they cannot be kept to the three R's for the whole of every school-day, they learn such things as can be taught them without books by their teachers. If the elementary schools were all that they ought to be, a child would leave school at twelve not altogether unequipped for the humble career which ordinarily lies before him. He would read well enough to improve his acquaintance with books if his taste led him that way; he would be able to make out a bill, to sign a receipt, and to write a letter; he would be familiar enough with figures not to be cheated in paying an account; and he would have some slight general knowledge of the physical conditions of the world and of the historical conditions of the country in which he lives—that kind of knowledge which an intelligent teacher can give in conversational lectures with the help of a black board, some maps, and a few tables of dates. This is what an elementary school may hope to do under very favourable circumstances. It is needless to say that in a very large number of cases circumstances are not very favourable. Children come to school when they are too old, and leave it when they are too young. While they are there they do not attend regularly. The school apparatus is old-fashioned or otherwise unsuitable. The teacher is a bad hand at keeping order, and consequently a great deal of time is wasted. From these and similar causes the most is not made of the single opportunity that the children have of learning anything, and many of them go away from school knowing very little, and certain to forget even that little. These, even at the best, are the objects for which elementary schools exist. It is well to enumerate them by way of reminder, because we are sure that the nature and extent of them would never be divined from the opening address at the Conference of elementary teachers. The speaker claimed for the Union that it had created in the public mind a truer estimate of the work and position of teachers, had checked unsound educational legislation, and had secured many acknowledged improvements in the code. That it may have achieved this last result is possible. The code is now so fearfully and wonderfully made that it would be the height of rashness to dogmatize as to how its multitudinous clauses found their way into it. As regards the supposed enlightenment of the public mind, it is to be feared that the Union congratulates itself without cause. There is nothing about which people are more hopelessly at sea than the work and position of elementary teachers. They have no clear idea of the qualifications wanted for the work or of the means by which these qualifications are to be secured.

It is certain that they will receive no enlightenment, except of a purely negative kind, from the address in which these triumphant results are claimed on behalf of the Teachers' Union. The whole of it may be read and re-read without any suspicion that it refers to schools of the sort we have been describing. It speaks of the teachers' function as being to give a "liberal education." It urges them not to neglect the acquisition of political influence.

It advocates the creation of a Representative Educational Council, incorporated by Act of Parliament, in which shall be vested the sole power of granting diplomas to teachers. It complains that the present supply of teachers is far in excess of the demand, which we presume is the equivalent in Economical language of a complaint that even now teachers cannot get as high salaries as they think they deserve. It objects to the employment of pupil teachers, and raises the question whether the education of teachers should not begin at the training colleges instead of ending there. All this, it will be observed, has reference to the partially gratuitous teaching of poor children under twelve years old. It is to them that a "liberal education" is to be "given.". It is for their benefit that a Representative Educational Council is to be incorporated, and that teachers are to be subjected to a longer and a more costly preparation than is now prescribed for them. So far as we can see, the whole of the supposed gain will be intercepted on the journey. The Teachers' Union suggests no way of keeping children longer at school; its one object is to ensure that teachers shall be more expensively prepared and more largely paid for teaching them while they are there. The process the Union proposes to itself is one for the better provision and grinding of razors with which to cut stone blocks. It is only to be expected that a large profession should look after its own advancement, and there is no reason to quarrel with elementary teachers for not being more unselfish than their neighbours. All that it is necessary to do is to warn the public that their interests and the interests of elementary teachers, as interpreted by the National Union, are antagonistic rather than identical. What is wanted in the interest of the public is a sufficient supply of competent teachers who are not above their work. It is plain, from the President's address, that some members of the Teachers' Union are very much above their work. It is a most important thing that the children of the poor should receive the rudiments of education; and the law has been very properly called in to ensure that they do receive them. It is quite right that every parent should be compelled to send his child to school for a reasonable number of years, and that while the child is nominally at school the parent should be compelled to see that he attends regularly. It is greatly to be desired that the years which a child stays at school should be spent under the care of capable and intelligent teachers. So far, however, from there being any need of a new organization to provide teachers, there seems rather need for a revision of the arrangements already existing for that purpose. We are in danger, as it seems, of getting too good an instrument for our money—too good, that is to say, not in regard of the work itself, but in regard of the estimation in which the instrument holds the work. The career of an elementary teacher cannot be an exciting one. He may look of course to the satisfaction that attends the consciousness of humble service honestly rendered. But the service will remain humble to the last, and if the teacher does not realize this fact, he will be very likely not to honestly render it. The proceedings of the Teachers' Conference at Brighton, so far as can be judged from the opening address, are distinctly open to this objection. They point to a conception of the elementary teacher's duties which must inevitably be injurious to the proper discharge of them. An engine-driver who thought that he ought to have been a Civil Engineer, and whose mind was chiefly occupied with schemes for raising his class and himself with it to this its proper level, would not succeed in doing what he wanted, but he would make an uncommonly bad engine-driver while he was trying to do it. As regards elementary teachers, the danger arising from their becoming over ambitious is twofold. There is first the probability that they will do their proper work less well, and next the probability that they will insensibly change the character of their work. So long as the Government grant depends on the number of children who pass the Inspector's examination, managers may probably be trusted to keep the former tendency in check. But there is no room for similar confidence as regards the second tendency. There are many philanthropic persons who see matter for rejoicing in every addition to the Schedule of Extra Subjects, and who think that the money of needy ratepayers cannot be better employed than in giving children, whose parents are in many cases better off than they are, the means of qualifying themselves for entry into a superior school. It is upon this sentimental disposition that the Teachers' Union will seek to work; and, judging from the proceedings of the London and Birmingham School Boards, it may fairly hope to work upon it with considerable effect.

THE JESUITS AND THE CIVIL POWER.

We have discussed elsewhere the decree issued by the French Government, with questionable justice and more than questionable wisdom, for the expulsion of the Jesuits. But whatever may be thought of the policy and probable results of the rebuke thus administered to the Senate for its rejection of the seventh clause of the Ferry Bill, the feeling which prompted the measure opens out an inquiry of considerable interest, which the indiscreet method of its expression in the present case tends rather to heighten than to diminish. For the existing hostility of French Republicans to the Jesuits is no isolated or exceptional phenomenon, nor is it at all peculiar either to France or to the Republic. It is of course true, as we have been copiously reminded in the course of the recent debates in the French Chambers, that the Monarchy of the Restoration maintained an equally unfriendly attitude towards the Order, while about a century ago the Court of France joined the other Catholic Powers in demanding its suppression. But this is only a very small part of the truth. From its very foundation the Jesuit Society has somehow or other enlisted against itself the jealous hostility both of civil and ecclesiastical authorities in every Roman Catholic country of Europe, not less than of Protestants, against whose advance it was specially organized. This is surely a sufficiently remarkable fact, and it does not become less remarkable when we reflect that the conflict appears always to have been keenest in those countries where the Jesuits were most intimately known. The Order was founded by a Spanish knight, and it bears in its character and constitution the traces of its Spanish origin. Yet it was Charles III. of Spain who brought about the league of Catholic sovereigns which led to its suppression by Pope Clement XIV. In Italy, again, the new Society found its earliest home, and has always had its headquarters and the base of its operations; and in Italy—and among their own former pupils—the Jesuits have met their bitterest and most uncompromising assailants. We have said that from the first they had provoked the animosity of both civil and ecclesiastical authorities, and in saying this we did not refer only or chiefly to the rivalry—often exceedingly bitter—between the secular and regular clergy, which dates from the earliest introduction of religious orders into the Church, and is intelligible enough, even apart from the justice or injustice of their mutual recriminations. Yet even here it may be worth noting that no other order—not even the Franciscans, who were the best hated of all during the later middle ages—ever managed to draw on itself the same intensity of mingled hatred and distrust. It is more material to remark, what is at first sight far more inexplicable, that not only bishops but the Popes themselves have from the days of Ignatius downwards shown a deep distrust of the Society expressly organized by him for the maintenance and augmentation of Papal autocracy. Paul III. inserted a clause in the original Bull of authorization, limiting the number of members to sixty, and although he was afterwards induced to withdraw a restriction so fatal to their aims, Sixtus V., by far the ablest pontiff of the sixteenth century, resolved on enforcing several sweeping changes in their constitution, including a change of name, about which they were extremely sensitive, and was only prevented from carrying out his intentions by the shortness of his reign. Two centuries later Clement XIV. was willing enough to accede to the universal demand of Catholic Europe for their suppression; and it is an open secret that there is little love lost between the Jesuits and the present occupant of the Papal throne. It must be allowed that such facts require an explanation, which is not adequately supplied by their own proud boast of how completely their founder's prayer has been answered, that they might be hated of all men, like Him whose name they have assumed, and for His name's sake.

There may be said, roughly speaking, to be three current phases of opinion which may be taken variously to interpret the traditional instinct or prejudice against the Jesuits. We have first the popular Protestant hypothesis, of which Mr. Whalley used to be the spokesman in Parliament, and which found a ghastly illustration in the sensational religious works of the days of our grandmothers. According to this view the Jesuits are a kind of secret police of the Evil One, being occupied in promoting the interests of their Church, which are identified with their own, by fair means or foul, with a diabolical craft only exceeded by their diabolical wickedness. They have spies or familiars, male or female, in every court, every society, in almost every private family—especially in Protestant families; they are united in a chronic conspiracy against the peace alike of households and of empires. It was not beneath them to bribe or coerce the reporters, as he publicly complained in Parliament, into garbling their version in the *Times* of the somewhat inaudible language of a venerable Irish peer lately deceased, and it is not beyond their capacity to control by invisible and unsuspected agencies the policy of States, and virtually to shape the destinies of the civilized world. They are gifted with the preternatural power, as well as the Satanic malice, of the genii of Eastern fable, while, unlike them, they are closely bound together in a federation of evil for the pur-

suit of a common end. They are disguised at this moment, in spite of the labours of the Church Association, in the surplice of Anglican rectors, while "the female Jesuit" plies her seductive arts under the innocent semblance of a Protestant kitchen-maid. Let no one imagine that we have dressed up a mere scarecrow of our own, or laid on one touch of colouring which it would not be easy to match in the familiar pictures drawn by Protestant alarmists. No rational person of course accepts this startling caricature—which may be compared with the delineation of the Freemasons sometimes found in foreign Jesuit treatises—but even the silliest caricature has usually some kind of basis, however inadequate, and there could hardly be so much smoke if there was no fire. More plausible, and less wildly inaccurate, is the opposite hypothesis, formerly prevalent among English Liberals, and accepted with a difference by many earnest Roman Catholics, that the Jesuits are much like other orders in the Church of Rome, more zealous and energetic perhaps, and therefore naturally more offensive to those who regard with dislike or fear the progress of the Roman Catholic religion, but not otherwise distinguishable from the general mass of religious corporations from which they are so sharply and unfavourably discriminated by the recent action of the French Government. This view on the surface looks reasonable enough, and it is really nearer the truth than the Protestant bogy view, but it is not the less quite unequal to the exigency of facts. Benedictines, Dominicans, and Franciscans have been in their day as zealous and as influential as Jesuits, and the Dominicans moreover were officially connected with the hateful and hated Inquisition, yet none of these vast and powerful organizations have ever encountered, either within the pale of their own Church or beyond it, a tithe of the suspicion and enmity so persistently roused by the children of Ignatius. Some third hypothesis is manifestly required, which, without violating the dictates of experience and common sense, shall yet do justice to the admitted facts of the case past and present. And that hypothesis may perhaps be not inaptly summed up in the well-known saying about the Jesuits, *ubi bene, nihil melius: ubi male, nihil pejus*. They have been powerful alike for good and for evil, but always powerful, and always using their power, whether well or ill, for the aggrandizement of their Order. They have acted all along as an *imperium in imperio*, confronting "the white Pope" with "the black Pope," and not unfrequently pitting the one against the other with a large measure of at least temporary success. And hence from their first origin the Popes have been very naturally suspicious of these self-chosen prætorians, as the Roman Emperors were jealous of the Prætorian Guards and the Sultan of the Janissaries, lest they too should aspire to make and unmake and mould the rulers before whose throne they bowed in professedly absolute subjection.

No estimate of the Jesuits would be a fair one which ignored the real services they have rendered to the highest interests of their Church, and indeed to the cause of Christian civilization. They have been effective preachers, and were for a long time the ablest and most accomplished teachers of youth throughout the continent of Europe; even now, when they seem to a great extent to have lost their educational cunning, their schools in France are pronounced by independent critics, like Mr. Matthew Arnold, to be at least equal in intellectual working, and decidedly superior in moral culture, to the best of the Government *lycées*. They have on the whole maintained unbroken, in spite of the worse than questionable ethical system exposed by Pascal, a far higher standard of moral purity in their own body than any of their rivals either among religious orders or the secular priesthood. And they have shown themselves devoted, untiring, and very successful missionaries in heathen lands. Yet even here their career has been marked by strange aberrations, inconsistent at once with their religious profession and with the principles of morality, as in the famous controversy about the "Chinese Rites," described at length in Mr. Cartwright's *Historical Sketch*. And that very controversy would alone suffice to remind us that, after full allowance has been made, as it ought to be made, for *ubi bene, nihil melius*, there is also another and a darker side to the picture. The ambitious design which was indelibly impressed by Ignatius Loyola on the constitution—we might add the very name—of his Order has proved throughout the secret both of its weakness and its strength. To that supreme end all considerations, moral and religious, not excluding their most cherished theological principle, have been subordinated. From the first they were not content to trust to their enormous educational and spiritual influence, but aspired also to "shape the whispers" of all the Catholic thrones of Europe, and to undermine all the thrones which they regarded an anti-Catholic. They governed the French Church through the mistresses of Louis XIV., and they plotted persistently against the crown and life of Queen Elizabeth. They did not scruple to make good their position at the French Court by more than conniving at Gallican opinions—which could never have been their own—and actually helped to frame the Declaration of Gallican Liberties. When threatened with expulsion from France in the last century, they offered to purchase a reprieve by teaching the Four Gallican Articles, which directly contravene the fundamental principles of Jesuit theology. Their influence has everywhere been used, and perhaps consistently used, in the service of both civil and ecclesiastical despotism; but the means employed have not unfrequently been such as no plea of conscience could excuse. When the Order was dissolved by the authority of the Holy See, which they of all men were bound to respect as final and absolute, they held together in defiance of it under the shelter of the schismatic Governments of Russia and Prussia. They are not only "Catholics first and patriots afterwards," in whatever country their lot may be cast, but Jesuits first and Catholics afterwards. The interests of the Church are to their minds summed up in the interests of their own Order, and a Pope who opposes them, like Ganganelli, is, ecclesiastically speaking, no better than a suicidal maniac, whose dangerous perversity it is the truest charity to restrain. Still more of course are secular Governments which pursue an anti-Catholic—that is an anti-Jesuit—policy to be treated as natural enemies; while in dealing with Governments which could be made subservient to their purposes they would adopt, as they have shown in France, in Mexico, in China, and in Russia, a policy of the extremest Erastianism. That a society numbering many thousands of members, spread over the face of the world and organized on the strictest principle of military discipline, so resolute in its ambitious aims, and so versatile and unscrupulous in its methods of prosecuting them, should be viewed with jealousy by civil Governments—and not least by the Governments of Roman Catholic countries, where its influence is most likely to be felt—can be no matter of surprise. Their official organ, the *Civiltà Cattolica*, specially authenticated by a Brief of Pius IX., declared shortly before the Vatican Council that "Christian States have ceased to exist; human society has relapsed into heathenism, and is like an earthly body with no breath from heaven." The Syllabus and the Vatican Council, the two crowning achievements of modern Jesuitism, were their chosen instruments for reversing this fatal tendency of modern civilization. It is not wonderful that the civil power, thus rudely challenged, should have learnt to regard the Church which they claimed to represent, and under the last pontificate practically ruled, as "an organization bristling with dangerous sentiments," and the Jesuit Order itself as "the Prætorian Guard of a dangerous ecclesiastical Cæsarism."

CANVASSING.

CANVASSING is one of the most ancient political practices in existence, and it is also one of the most disagreeable. Few, indeed, of those who aspire to Parliamentary honours are fortunate enough or bold enough altogether to escape from its mortifications, and for several days past hundreds of well-meaning and high-principled gentlemen have been suffering acutely from the mental and physical distress which it entails. Under the most favourable circumstances the ordeal is one to which all but the most inexperienced look forward with disgust; while in those places where the constituency just falls short of being large enough to render a personal canvass of the whole electoral body obviously impossible, a trial of the severest kind is put upon the health and temper of a candidate. In such cases it is considered a matter of paramount necessity that every effort should be made to accomplish the feat of shaking each individual voter by the hand; and for this purpose from morning till night the candidate, like some one of the professional pedestrians of the day, is compelled to devote himself to his task of dreary perambulation. Perhaps the canvassing of a county is even more trying than that of a borough. In bad weather it is certainly so, and at the best of times the distances which have to be covered obviously tend to aggravate the strain which the nervous system is called upon to endure.

The physical trial, however—the loitering in east winds, the hanging about unresponsive door-knockers, and the trudging in unsavoury slums—is not the worst of the evils which the canvasser has to suffer. The vigil which must be kept by this unhappy postulant of the honours of St. Stephen's possesses other features from which the stoutest heart may well recoil. Among these, the well-intentioned hospitality which produces for the refreshment of so distinguished a visitor the inevitable "sherry" is the most terrible. To refuse is dangerous; to drink is to rush upon almost certain doom. Between the affront and the glass the unfortunate candidate has no alternative; and he will probably, as long as tortured nature can endure, prefer rather to sip than to offend. Then, too, there is the absolute necessity of preserving an appearance of *bonhomie* and affability foreign possibly even to one's most favourable moments. In spite of the weariness of body, the east wind, and the sherry, each new elector must be greeted with a smile of benevolent joviality, and each new hand must be shaken with the same fervid heartiness. Nor can the mind even be allowed to distract itself from the appointed task. A jocose answer or a good-humoured repartee must be always ready should the occasion arise; while an ever-patient and sympathetic ear must be turned to the prolonged tales of complicated suffering which the humbler classes delight to tell. In an immense number of cases it will be found that the free and independent elector himself is absent; and in such an event all the arts of fascination have to be employed in securing the good opinion of the female part of the establishment. Especially on these occasions, and indeed always, must due notice be taken of the children, who will be found everywhere to abound in inverse proportion to the accommodation which the premises seem capable of affording; and the most pronounced attentions must be of course devoted to any baby whom the watchful eyes of the candidate or his companions may be able to detect. If nature has not implanted in your bosom an instinctive desire to kiss every infant in the constituency, yet, as the Honourable

[illegible] Slumkey admitted, "it must be done." In spite, it may [illegible] almost Herodian antipathies, the struggling innocent [illegible] unhesitatingly upon the knee, and its suspicions, should its gaze be attracted in that direction, must be at once allayed by a detailed examination of the mysteries of your gold chronometer or any other part of your apparel which may take its youthful fancy. In these conciliatory efforts, which aim mainly or exclusively at winning the approbation of the female heart, it need scarcely be said that personal appearance is a matter of much importance. Talleyrand is said on one occasion to have defeated Mirabeau at an election for the National Assembly by calling attention to the fact of his rival being severely pitted by the smallpox; and there is no doubt that, especially in these domestic visits, the young and interesting candidate possesses a considerable advantage over a less prepossessing opponent. He will probably, in order to obtain the fullest benefit of it, be recommended to adopt, even at a considerable sacrifice of comfort, the most becoming and distinguished mode of dress which can be devised, and it may be well for him before taking his departure to present to each household a few cartes-de-visite, the distribution of which is the newest and most fashionable development of the electioneering art. Photographers are already in the habit of soliciting such orders "by the thousand copies," and no doubt when the great era of female suffrage ultimately arrives, enlarged photographs will be placarded as freely as "squibs" or addresses.

It is, however, necessary for the complete canvasser to be no less prepared for rebuffs than for conquest. Not impossibly the door, in answer to his insinuating tap, will be opened only just far enough to disclose the form of a hostile and implacable elector who lowers upon the disturber of his peace as savagely as if he were a sheriff's officer or the parish rate collector. In vain the most courteous smile is directed at this ugly Caliban. He grunts out perhaps that he is a Republican, or at any rate that "he don't want any of you," and the door is again shut with a sharp and decisive click which leaves you half inclined to laugh, and more than half inclined to commit immediate trespass and assault. But fortunately the rebuff direct of this kind is not common, and in most cases even the least yielding opponent is not unwilling to discuss his differences with his visitor upon the vantage ground of his own premises. Some persons we have met who, after welcoming their visitor with a most deceptive courtesy, have launched out as soon as it is too late for retreat into an evidently studied denunciation of him and his party. The unfortunate candidate, like the Wedding Guest, is unable to escape, and it will be almost useless for him to attempt to stir until his tormentor has succeeded in discharging the suppressed political irritation with which his breast is burdened. On these occasions the assistance of friends will be found invaluable for the purpose of distracting the attention of the foe from the principal object of his attack, but they can at best only make a slight diversion, and the first opportunity has to be taken of evacuating in as good order as possible the untenable position. Another stumbling-block which the canvasser is pretty sure to come across in the course of his peregrinations is the man who, without declaring himself absolutely irreconcilable, is desirous of having a few points cleared up before he can conscientiously promise his support, and who proceeds to interrogate the perhaps youthful and inexperienced politician as if he were an embodied digest of all the Blue-books in existence. The same gentleman is dissatisfied with some points of your recent speech, and the local paper having been produced, the oration delivered with so much effect a few nights since to an enthusiastic gathering of not over-logical supporters is subjected to a cold statistical criticism which it was ill fitted to bear.

Another difficulty to be contended with, and one against which it will be well to be prepared, is the man with a crotchet. He is a teetotaller, or an anti-vaccinator, or flogging in the army is his particular antipathy, and upon one or other of these hobbies his entire political energies are concentrated. Your feeble protestations in favour of temperance or your general declarations against persecution and cruelty serve rather to excite than to appease him. He will have a pledge or nothing; he demands the immediate suppression of the class or practice to which he objects, and unless you are prepared to join him in a Parliamentary crusade against publicans or doctors, or the cat, your eloquent remarks on Imperial interests and European policy will be wholly lost. Then, too, there is the religious enthusiast, who adopts the manner of a Jeremiah and warns you that the especial vengeance of Heaven is in store for your party in general and you in particular. Utterances of this kind are of course unanswerable, and the candidate will be compelled to depart summarily while his admonisher perhaps treats him to a few verses of one of Moody and Sankey's hymns as he goes, by way of exorcism. But it must not by any means be supposed that all or even the majority of persons with whom the canvasser has to deal will display any very lively interest, either hostile or otherwise, in the purpose of his visit. Absolute indifference to political disputes will be found in a great many cases to exist, and it will then be only on local or personal grounds that any successful appeal can be made. Among the very poor, the great difficulty is to parry the more or less direct invitations to bribery which are thrown out. Traditions of corruption still hang about certain districts and places, and a vote is there regarded strictly as an article of commerce. In such cases an air of considerable reserve and mystery is wont to be assumed; the fact of the existence of a wife and six children is insinuated, and the badness of the times is dwelt upon with peculiar emphasis. When these artifices fail in eliciting anything more than expressions of sympathy, and assurances of the great regard entertained by "the party" for the working classes in general, more undisguised overtures will probably follow, and either there will be a direct intimation that, great as is the elector's devotion to yourself and your party, something will have to be done for him before his allegiance takes the practical form of coming to the poll, or, as is by no means uncommon with the more astute, some worthless article, such as a roll of blue calico or a cracked teapot, will be offered for purchase "on your own terms." As a last resort, something to drink is usually applied for, and when this, too, has to be refused, it requires more than ordinary tact to prevent an outbreak of undisguised hostility, which even the expressive glances of your experienced agent are unable to avert.

Amid such curiously varied experiences of men and manners the day's work is at length completed, and unless there is a meeting to be attended or a deputation to be received—which is only too probable—some few hours of well-earned repose may be enjoyed before the time comes for sallying forth upon the labours of the morrow. In such intervals one will be apt to reflect that perhaps even the proud position of a British legislator may be purchased at too dear a price; and certainly it is devoutly to be hoped that the days are not far distant when the hideous necessity of canvassing will be numbered with the *peine forte et dure* and other obsolete forms of torture.

A NEW EXPONENT OF MILL.

IN October last Professor Max Müller delivered an address "On Freedom" to the members of the Birmingham and Midland Institute, which he afterwards published in the *Contemporary Review* for November. To the majority of his readers his discourse probably appeared to be well worthy of consideration, if somewhat discursive, and to be marked by the singular liberality of thought which was to be expected in anything produced by this distinguished writer. The British Radical, however, is not as other men are, and he is able to detect over-much contentment with the existing state of society, and too marked an indisposition to break with the past, where others can only see unprejudiced thought and advanced ideas. One Mr. James T. Mackenzie has commented in this month's *Contemporary* on Professor Max Müller's article, and has certainly been animated by a strong desire to prove the shallowness of the optimist and conservative opinions he attacks. We must confess to not knowing who Mr. J. T. Mackenzie may be, or whether he has ever sought to enlighten the world before; but we are consoled for our ignorance by the reflection that, deplorable as it may be, it is probably general. Judging from the style of Mr. Mackenzie's essay, which reads so oddly in the excellent periodical to which he has been allowed to contribute, we should say that his sentences have hitherto been composed for the benefit of debating societies. One passage seems strongly to confirm this supposition. Mr. Mackenzie dislikes certain Acts of Parliament; so he says that, if the "printers had refused to give out the MS."; "if the compositors had struck rather than set up anything so utterly filthy and detestable; if policemen and surgeons had refused to exercise their powers, and had barbed their refusal with scorn and execration"; "if there had been a general insurrection and refusal to pay taxes"; "and if Englishwomen had gone into sackcloth," "then there would be reason to believe that the spirit of liberty was not lying in a swoon of drunken luxury in the English people." Now this remarkable piece of declamation, with its talk of barbed refusals, and sackcloth, and a spirit which somehow lies in a drunken swoon in a people, is very similar to that which greatly delights young men at debating clubs; and it is difficult to believe that the writer is not fresh from practice at one of those institutions. It is possible, however, that what seems the natural inference from this and other thrilling paragraphs is incorrect, and that Mr. Mackenzie is one who has long trodden in the paths of righteousness, and has often instructed mankind before. In that case, we can only compliment him on the youthful vigour which marks his peculiar rhetoric.

It may seem strange at first sight that Professor Max Müller's remarks about Mill should have raised Radical ire, inasmuch as he shares the views which that great writer expressed as to the gradual suppression of individuality, and says that, though "the enemy whose encroachments Mill feared most and resented most has been driven back and forced to keep within its own bounds," his "principal fears have nevertheless not been belied, and the blight of uniformity which he saw approaching with its attendant evils of feebleness, indifference, and sequacity, has been spreading more widely than ever in his days." Thoroughgoing worshippers, however, are never satisfied with what is said of their prophet by any one who has not the same unquestioning reverence and devotion as themselves; and Mr. Mackenzie is so angry with Professor Max Müller, apparently for venturing to handle Mill at all, that, with the grace and gentlemanly feeling which so often mark writers of his calibre, he hints that the Professor has not consulted on one point the work of which he speaks. In this Mr. Mackenzie is following the example of the Comtist writers, who frequently begin controversies by asserting that their antagonists have not read Comte; and, no doubt, it is permissible to believe that the dreary pages of the verbose Frenchman have been too much for students; but to suggest that a learned man, famous above all things for his untiring industry, has commented on a well-known and very short book without

having read it all is as childish as it is impertinent. However, Mr. Mackenzie is wroth, and with disputants of his class good sense and good taste alike disappear when indignation is felt. What cause there can be for anger, apart from the jealousy of a votary, it is certainly hard to discover. Seemingly, the reason for discontent with Professor Müller is that he thinks that men now enjoy as much freedom as Mill claimed for them twenty years ago. To none but the Radical mind could such a statement, whether altogether true or not, appear offensive; but to the Radical mind it is intensely irritating. "The passage in the Professor's article which most of all startled me," says Mr. Mackenzie, "was the following:—'I can hardly believe that, were he [Mill] still among us, he would claim a larger measure of freedom for the individual than is now accorded to every one of us in the society in which we move.'" Professor Müller therefore startles his eminent critic, and, it would seem, by inference reflects on Mill, when he says that Englishmen are free. To prove the erroneous nature of this shallow view, which, it is to be feared, is very generally held, Mr. Mackenzie refers to the statutes which he thinks so wicked, to "the Mrs. Besant dead-lock," to the Truelove prosecution, and then, after rambling in a hazy manner through various subjects, makes the following remarkable statement:—

> There is scarcely one of the shackles to which Mill referred by name that has been removed; while several of the old weapons against freedom have been hunted up and loaded, ready to go off in case of need. Some causes of opprobrium have been removed, for example, by the Secular Oaths Bill; but, speaking broadly, whatever legal freedom of discussion and action has gained, has been gained by compromise or a fluke. The opening of museums, picture galleries, &c., on Sunday (which he advocates in strong terms, but as to which I hesitate greatly), will probably be carried before long; but, on the whole, the power of society over the individual, whether by law or otherwise, has been immensely fortified. Mr. Max Müller looks at these things from the summits of "the mountains of Rasselas," or some such place, with that splendid and capacious brain of his full of Sanskrit. If he will read more newspapers, and read them minutely, he will receive a very different impression from that which now possesses him. Judges, magistrates, barristers, and officials of various kinds have taken to putting on the legal screw in ways which were not dreamt of in the days when Mr. Mill wrote his Essay. I could quote from memory a score of instances within the last few months—instances, I mean, in which official administrators of one kind or the other have used the law as a screw to compel not only judicially formulated compliance, but compliance far beyond that limit. It is one of the vilest forms of persecution, and it is a growing one. The specific cases are passed over in silence, or half silence, because no one likes to touch pitch; but that is what the administrators count upon.

Of the specific cases referred to little need be said. Mr. Mackenzie happens to dislike statutes which were undoubtedly passed for the public welfare, and therefore speaks of them as though they belonged to the middle ages. Of the Truelove case he is not qualified to speak, as he admits himself that he has never seen the incriminated pamphlet. His general statements, however, do certainly charge either the governing classes or the majority—it is not clear which—with very grievous sins, and describe a condition of society which would unutterably horrify Mr. Mill if he could come amongst us again. There is terrible oppression. Judges, magistrates, and officials put on the "legal screw," and in turn a screw—illegal, it may be presumed—is put on the judges and magistrates by some mysterious body, and the result is the vilest persecution. The ordinary Englishman, who is under the impression that he is the free citizen of a free country, will be astonished when he learns, from a paragraph which might at first sight be thought to describe Russia rather than England, how utterly mistaken he is. Perhaps, however, he will derive some consolation from observing, when he recovers himself enough to read the passage over again, that the assertions in it are altogether general, and are not supported by a tittle of proof. Mr. Mackenzie has been so "startled" by Professor Müller's statement that nowadays there is freedom in this country as to feel impelled to startle others by proclaiming that oppression and corruption are steadily advancing in the land. Wisely, however, he makes no attempt to prove the truth of his remarkable allegations, and for this reticence he doubtless has the best of all possible reasons. The gentleman who steadily maintains that the earth is flat and not round contents himself with simply making the assertion, and Mr. Mackenzie follows his excellent example. In either case disproof or argument would be altogether superfluous. We have given this extract from his article for the same reason that we have chosen his article for comment—namely, to show what strange things Radicals are willing to say; but it would be a waste of space to answer this balderdash which has been so strangely allowed to appear in the pages of the *Contemporary Review*.

Another part of his article is worth referring to as it shows a singular propensity which is not uncommon with those who consider themselves fitted to reorganize society. As we have said, Radicals seem to view with extreme dislike the treatment of their prophet's doctrines by any but themselves; yet when it suits them they are willing to treat those doctrines in the freest possible spirit. Thus Mr. Mackenzie has to speak in the course of his article of Mill's view with regard to marriage, and he takes the opportunity of explaining Mill's opinions and of saying what his views would be if he were alive now. It need hardly be said that those opinions, as stated by Mill himself, have long ceased to carry any weight. The painful story of his private life has, unfortunately, been made known to all; and it has been seen that his discreditable union with the woman for whom he had so frantic an admiration must in all probability have prejudiced his views respecting the marriage contract. These views, however, are precisely what his discreet and modest disciple selects to dwell upon; and, not satisfied with Mill's careful and comparatively moderate speech, he proceeds to amplify it, and to explain what his master might, could, should, or would have said. The following is the explanation of Mill's opinions which this diffident writer offers a good many years after Mr. Mill's death:—

> We may conjecture that if Mr. Mill were now living and were to address himself to this subject generally, he would first of all demand that with regard to the one ground on which English law now *dissolves* the contract, the wife should be placed (as she is in Scotland) upon a footing of entire equality with the husband; secondly, that there should be liberty for the spouses to dissolve the contract by mutual agreement, under proper guarantees; and, thirdly, he would maintain that the one injury which is held in England to dissolve the contract (from the husband's side) is not in itself necessarily the worst or most fatal, and that therefore the list of causes for which one of the spouses may by compulsion get freed should be made wider. But he was, as I have remarked, a very cautious and reticent propagandist, and it is only by close watching and *reading particular passages in the light of general propositions which are locally a long way off from them* [the italics are Mr. Mackenzie's], that you get at his whole meaning.

A very full meaning certainly when the student thus enlightened is able to "get at" it. But why, it may be asked, preserve the institution at all if it is to be so much shattered? Why not follow the example of the Nihilists, who are consistent, and do away with the marriage contract altogether? Doubtless, the next disciple who expounds Mill for the multitude will discover that, by throwing the light of a sufficient number of propositions on a sufficient number of passages a long way from them, it can be clearly shown that, if he were alive, he would earnestly advocate the complete abolition of marriage.

There are many other passages in Mr. Mackenzie's attack on Professor Müller's discourse and exposition of Mill which are almost as amazing as that just quoted, and might be worth citing as showing the singular constitution of the Radical mind; but probably our readers will be of opinion that enough of Mr. Mackenzie's effusion has been given. There is, however, one more observation to be made about it. Singularly enough, the very appearance of this silly stuff in the pages of such a periodical as the *Contemporary Review* demonstrates the facts which Mr. Mackenzie seems most anxious to dispute—to wit, the progress of tolerance in England, and the effect which the better part of Mill's writings has had on English opinion. There is now such a readiness to listen to both sides that a very feeble writer may obtain a hearing against a very illustrious one if he thinks that there is some ground for complaining that the other's treatment of a question has been misleading. The facts in the present case are not a little remarkable. Professor Müller, a man of the highest attainments and possessing a European reputation, makes some remarks about Mill's Essay on Liberty in a discourse which he publishes. To these Mr. Mackenzie—an utterly obscure man—objects, and, though he has not the smallest literary capacity, and really has nothing to say that is in the least worth attention, he is allowed a place in the magazine that contained Professor Müller's article, on the ground, we suppose, that in anything like a controversy both sides must be heard, however weak the arguments of one of the disputants may be. In this case it certainly seems as if the principle of toleration had been carried too far, and as if the editor, in his anxiety for fairness, had not sufficiently considered what he was inflicting on his readers; but nevertheless, if there has been a fault, it has been a fault on the right side, and the appearance of such an article as Mr. Mackenzie's in the *Contemporary Review* shows how deeply one of the principles for which Mill most earnestly contended is now respected.

THE BISHOPRIC OF LIVERPOOL.

BLUNTLY stated, the fact would seem incredible, that until Queen Victoria had been nine years on the throne there were fewer bishoprics in England than there had been in the reign of Henry VIII. The ill-devised see of Westminster which he set up collapsed when Edward VI. translated its first holder to Norwich. Mary replaced the Benedictines in the Abbey, and although Elizabeth restored the Dean and Canons, she let the bishopric drop without substituting any other in its place. The diocese of Ripon, indeed, was established with a great flourish of trumpets in 1836; but the price which the Church paid for the benefit was the amalgamation of Bristol with Gloucester. At last the late Lord Powis's honest Welsh pertinacity overtrumped the stolid resistance offered by cowardice and routine, and in 1847 the see of Manchester was created, without the suppression of either of those in North Wales which had been destined to serve as victim. Then came thirty years of Commissions, Reports, Societies, and abortive Bills, till Mr. Cross, encouraged by exemplary private munificence, placed the movement on a new footing by launching that project of six new sees, equally divided between the provinces of Canterbury and York, which has now, by the completion of the endowment for Liverpool, been half accomplished, while the work is far advanced at Newcastle and a substantive beginning has been made at Wakefield and Southwell. The Home Secretary has had the courage to appeal for the success of his enterprise to an entirely new application of an established and universally lauded principle. For building and restoring churches, and for endowing their parsons, as well as for founding bishoprics in the Colonies, the State had long recognized the potency of private munificence. But a Lord Bishop of the Establishment, with his succession to the House of Lords, was far too grand a personage to be beholden

to voluntary alms for his means of living. It was all very well for a benevolent dreamer, such as Lord Lyttelton, to suggest so revolutionary an idea; and, as blowing bubbles is a very harmless amusement, he might be left to follow his bent. To Mr. Cross's mind, however, business-like as he is, the difficulty which presented itself was not the acceptance of the idea of voluntary succour for a public good, but the recognition of any principle which should make that acceptance objectionable. He was, indeed, adverse to one leading principle of Lord Lyttelton's Bill—that of the general enabling powers which it proposed to create for a formally unlimited increase of the Episcopate, without the see, the place, or the number of proposed bishoprics being specified in the statute. Whether this was excessive caution or not it is needless now to discuss. For our part, we think that the precaution of bringing in both Queen—that is to say, Ministers—and Ecclesiastical Commission, provided in Lord Lyttelton's Bill, would have been sufficient to prevent abuse. But the Minister accepted the other main feature of the measure, that of reliance upon voluntary benevolence. A fortunate occasion presented itself for bridging over any abrupt transition between the old idea that bishoprics could only be set up by readjusting the actual Church funds sequestrated by the Ecclesiastical Commission, and that of launching appeals for additional contributions. This was the timely and generous surrender by the actual Bishop of Winchester of the pompous see-house constructed in George IV.'s days by the bland Bishop Sumner in St. James's Square. The sale of this mansion proved to be a sufficient start for establishing the Bishopric of St. Albans, and that was soon followed by Lady Rolle's exceptionally noble contribution which made the long-desired and long-despaired of Bishopric of Cornwall a reality. There was a private donor ready in 1847 to have founded it, but the wise men of that day insisted on looking their gift horse in the mouth. The delay, however, was not on the whole unfortunate, as by the terms of Dr. Walker's offer the see must have been fixed at St. Columb, a far less advantageous site than Truro. His schemes creating these two bishoprics in the province of Canterbury were the models for Mr. Cross's later Act, which prospectively established a see taken from Lincoln and Lichfield at the old collegiate church of Southwell in the same province, and also Liverpool out of Chester, Newcastle out of Durham, and Wakefield out of Ripon, all of them in that of York. The existence of all these new dioceses was to be contingent upon private liberality, the only contributions of a public character which were accepted being limited stipends assessed upon those of the old sees which were to be respectively relieved, so that none of them should hereafter fall below 4,200*l.* a year, nor Durham, which is to give 1,000*l.* a year to Newcastle, below 7,000*l.* The minimum income of any new see was fixed at 3,500*l.* a year, or 3,000*l.* together with a house, and was not to exceed 4,200*l.* a year. The idea which underlies these provisions is that, as the new bishops would range with their older brethren both in Parliament and elsewhere, so they should also fairly match them in means.

Mr. Cross, in his anxiety that the increase of bishops should wear the appearance of being a development and not a revolution, laid great stress upon its being what he termed a moderate one. Without contesting the principle of this condition, we think that the application need not have been so rigid, and that the measure might well have provided by anticipation for the formation of new sees in Surrey (leaving that suburban region, West Kent, to Rochester), Suffolk, Warwickshire reviving the style of Coventry and including Birmingham, Bristol severed from Gloucester, Derbyshire, and Sheffield or Beverley. The practical prospects of completing the endowment in any of these cases would be about equal to that which exists in those of Southwell or Wakefield, and the difference between an ultimate number of two archbishoprics with thirty-two or thirty-eight suffragan sees is not so very vital.

No one donor overshadows all his compeers at Liverpool, although there are several gifts of 10,000*l.*, while the energy of one of these large givers, Mr. Torr, the late member for the borough, has been the chief promoter of the work. This new see will be the first example of an urban bishopric, as Truro was of a territorial one, started on the mere claims of the place to the benefit, and with no adventitious assistance from previously existing institutions. The sees of Ripon and Manchester, endowed as they were by the Church funds in the hands of the Ecclesiastical Commission, rested upon the actual collegiate church and its corporation already existing in each place, which by change of name became Cathedral and Chapter, while St. Albans already possessed its abbey. At Liverpool the need of a cathedral and chapter, for work and not show, is already felt and canvassed. The same generosity which has made the see a reality ought to be sufficient to ensure the accessories. When a county in so unprosperous a case as Cornwall is able to set in hand, for so small a place as Truro, a cathedral of the amplitude and the grandeur of the one which Mr. Pearson has designed, it would be a *laches* not to be dreamed of were Liverpool to lag behind. It is true that not every bishop of a new see may have the energy and influence of Bishop Benson. But, with his recent example to show the way, no one ought to be so deficient in the courage of conception and the patience of execution as not at least to be able with such superior advantages to tread in the steps of his Cornish brother. A random idea has been thrown out of utilizing the occasion at Liverpool for galvanizing a long-deceased and forgotten failure, and setting up Wren's happily rejected first notion for St. Paul's. This is of course a crotchet which cannot for a moment be entertained. We are unwilling to import what might be mistaken for party questions into the consideration of the subject. Nevertheless, at a time when the temptation of an electioneering triumph has proved to be motive enough for those whose whole career ought to have been a guarantee for nobler conceptions of statesmanship to bring the notion of disestablishment into dangerous familiarity with the minds least likely to make a good use of it, we may point out how strong a constructive argument may be found against the assumed popularity of the change in the unstinted affluence of voluntary donors, which had made both the extension of the episcopate and the revival of cathedrals in their buildings and their institutions not possible only, but popular, and brought them into course of execution.

The *Times* has been amusing in its solemn blundering over some incidents of the new sees which are being created. It has grasped the fact that bishops' seats have the honorary distinction of being entitled cities; and so it conjectures that, as soon as the Order in Council appears, Liverpool may, if it thinks fit, assume for itself that title. The idea that a grant from the sovereign is needful, and that such grant was actually made to St. Albans and Truro, never seems to have crossed our contemporary's mind. At this point, however, the *Times* gets vexed and troubled why Westminster should be a city, forgetful that Henry VIII. made it for a short time a bishopric, and that he gave it the consequent rank. Furthermore, our contemporary is sorely tried because certain existing towns and villages were Saxon bishoprics, and yet are no cities now. These mysterious places follow a simple law—namely, that the fact of the town having been a pre-conquestal see no more makes the place a city than it makes the parson a dean. Cities are the seats of post-conquestal bishoprics, excluding those Saxon sees which endured for only a few years after the Conquest; and in compliance with this rule, the only places so entitled which cannot show their separate bishops are Westminster, Coventry, Bath, and now Bristol.

PARLIAMENT AT THE ANTIPODES.

SINCE the announcement by telegraph of the discomfiture of the Berry Ministry in Victoria, there has been time for letters to arrive describing, not indeed the conflict itself, but the state of things which immediately preceded it. The *Times'* Correspondent, who has at intervals given very interesting descriptions of the political state of men and things in that part of the world, has recently devoted himself to the Victorian Assembly, and has drawn a very striking picture of what may be called the probable possibilities of democracy. The writer cannot be said to be prejudiced against Victoria or things Victorian. In another very recent letter he gives a description of Melbourne, its climate, its people, its institutions, which is little short of enthusiastic, and certainly goes beyond the accepted ideas on the subject. All travellers unite in praising the situation of the city near the magnificent harbour of Port Philip, and in admiring its public buildings and institutions. Democratic communities indeed are not wont to be behindhand in the latter respect, for the simple reason that such things contribute more to the enjoyment of the majority than to that of the minority, while they are erected more at the cost of the minority than at that of the majority. But the climate of Melbourne has by no means united all suffrages, and the fact acknowledged by the Correspondent that its death-rate is greater than that of most large English towns seems to show that there is some ground for doubt. We have heard Victorians themselves give unpleasant accounts of the tendency of their country's flies to dispute possession with human beings in such matters as food and drink. Nor do sharks in the bright blue sea and thermometers at 110° in the shade strike the home-keeping Briton as unqualified attractions. There is a delicate point which the writer touches upon, and wherein his testimony is again somewhat more favourable than that of local witnesses. It is of course perfectly unreasonable that a casual Englishman, because he chooses to visit Melbourne, should expect to be fêted and caressed. Indeed we remember reading an Australian novel in which the tax laid upon Victorian hospitality by such visitors was most bitterly complained of. This may have been an isolated case, but it deserves to be taken account of in estimating the *Times'* Correspondent's commendations of the "overflowing kindness and courtesy" of the Melbournians towards Englishmen. It is evident that at least he is not a prejudiced critic, or, if he be prejudiced at all, that he is prejudiced in favour of his subject.

The description, however, which this investigator gives of the proceedings and character of the last Victorian Assembly cannot be said to be attractive. The material arrangements of that Assembly are indeed all that the stoutest formalist could wish. There are a Speaker and a wig and a mace, and benches right and left, and cross-benches and a gangway, and many other indispensable accompaniments of legislative Assemblies on the English model. Democratic as they are, the Victorians have not yet fallen into one of the commonest and most unwise faults of democracy, the rejection of pomp and ceremony. Even Doctor Bidache, the Republican enthusiast in M. Sardou's play, came to the conclusion that in some respects it was a mistake to reject these vanities, and that, for instance, a civil marriage was terribly wanting in impressiveness. If the Victorian Assembly is not impressive, it is at any rate not for want of wigs. Another interesting

fact is that the Victorians appear to have inherited or acquired the curious English love of precedent, which is as mortar to the bricks of a constitution, and which, somehow or other, Continental bricklayers have never been able to secure. But, barring the precedents and the wigs, our leniently disposed critic does not find much to satisfy him in the Victorian House of Commons. He confesses to a regret that "the Queen's Government should not be carried on by statesmen who have at least mastered the Queen's English." We are afraid that the Correspondent is in the full Jacobin sense an "aristocrat," and, though there have been members of the British House of Commons who have had at least as much difficulty with the letter *h* as poor Mr. Berry, it may be admitted that the ears of Englishmen of a certain position are generally tainted with this aristocratic repugnance to the omission. Our author, however, endeavours to justify himself, protesting that he does not consider the *h* an absolute shibboleth, and that he is even willing to overlook rough manners, neglected dress, and an undue indifference to soap. But he cannot away with the metaphorical uncleanness of tongue and hands which accompanies this literal uncleanness. His examples indeed, as in the case of the *h*, might be retorted with some success upon Englishmen by Victorians, though as yet the precincts of the House of Commons itself do not furnish examples quite so heinous. When we hear that a Victorian Cabinet Minister called an opponent a cabbage-seller, it is difficult not to remember that a highly accomplished, and indeed altogether "superior," member of the British Legislature not long ago thought it comic and cogent to talk about "bookstalls" in connexion with the First Lord of the Admiralty. As for "liar," which seems to be a favourite word in Victoria, it has seldom been far from Mr. Bright's lips or pen during the last few months. Still, as we have said, these amenities are not openly exchanged in the House itself, though there is no knowing what we may come to soon. Another and exceedingly ugly weapon of Victorian controversy is the accusation of "stealing." The Correspondent says that accusations of this kind were habitually brought against the members of the late Cabinet, or most of them; that both parties take for granted that the chiefs of the other side, if not of their own, will help themselves and their friends out of the public purse. Here at least we may without Pharisaism congratulate ourselves that we are not as the Victorians are—as yet. The charges of jobbery which at rare intervals are brought against public men with us, and which are rarely well founded, differ *toto cœlo* from such charges of direct dishonesty. Nor have we yet arrived at the state of the Victorian Assembly in that famous scene not long ago when an irate member endeavoured to seize the mace or some other weapon, and to clear the House with it in the style of Larry McHale. As for another story told, it is disgraceful but comic, and approaches more nearly to what might have been possible in Ireland, if not in Great Britain, scarcely a hundred years ago. A Ministerialist was suspected of meditating treachery, whereupon the Government Whips made him very drunk, and brought him to vote in that condition. That a free fight should ensue, or something very like it, was evidently unavoidable. The House and the public generally seem to have been a good deal shocked by these performances, which is creditable to them. It is added, too, that this Assembly was an exceptional Assembly; though it is not clear what there is to prevent a succession of such exceptional Assemblies from being elected. The same Correspondent, in a previous letter, alluded to the Victorian habit of "blowing"—an interesting but elliptical phrase, to which, for the understanding of the people at home, it is necessary to add "their own trumpet." We do not know whether they blow much about their Assembly, which, to the British mind, might seem better treated by a judicious silence. It is said that the scandals of the last House—now, it is to be hoped, replaced by a better—have produced the usual and fatal effect which every democratic community from Athens to America has experienced. The best men in Melbourne—the best not merely by birth and wealth, but by intelligence, culture, and morality—have been so disgusted with the state of things that they will have nothing to do with it. They cannot deal the foul blows that the contest requires, and they do not care to expose themselves to them in a practically defenceless condition. The new Government may have for the time brought about a better state of things; but what Mr. Berry and his party succeeded in doing once they may succeed in doing again.

It may be a little dangerous, but is not uninteresting, to inquire whether the ugly consequences which the *Times*' Correspondent deplores are after all quite unconnected with the more trivial drawbacks in respect of manners which he describes. It is no doubt almost sacrilegious in the present day to hint anything of the kind. But, considering that manners are after all only a moral code embodied in certain half-conventional outward signs, there may be something to be said for the more old-fashioned view. A man who will not wash his hands because he has work which renders such a process useless is not blameworthy; but he who legislates can certainly spare the time for ablution, and, as the colony probably provides him with soap, cannot plead poverty. If he neglects these opportunities, it is probably not unjust to argue from his predilection for dirt of the physical kind to a predilection for the dirt of the moral kind. It is possible, though difficult, for a person who has from his youth up ignored the *h* to acquire the habit of using that letter, and he who does not shows an indifference to the good opinion of others which may—we do not say that it often does—extend a little further than orthoepy. Lastly, it must be remembered that the coarse personalities and foul aspersions on character which pain the Correspondent are, as a matter of fact, usually found in connexion with the absence of *h*'s and the presence of dirt. They are found elsewhere, no doubt, more's the pity, and they are fortunately by no means invariable accompaniments of personal and linguistic slovenliness. But, considering the well-known verdict of such a person as the late Mr. Mill on the moral characteristics of different orders of society, it would appear that there is still something to be said for the aristocratic conception of the governing man as against the democratic. We may add that the case of Victoria seems to show the same thing pretty strongly *à posteriori*. The "disgusting vices" which a great writer charges against democracy are corruption, civil dissension, and ingratitude towards leaders. This last article has been a good deal affected by changes of manners, which have sent the axe out of fashion. But, if we may trust the *Times*' Correspondent, the first two will have lately been as rampant in Victoria as they could well be short of actual civil war. A Government the majority of whose members were habitually charged with personal dishonesty; an Assembly which frequently, if not habitually, indulged in the language and manners of the frequenters of some low drinking-shop; and classes out of doors so embittered against one another that open violence was feared—these were the results of a model democracy. If any one chooses to set to the same credit the recent change, he can do so, though, considering the force of reaction in all cases, the proceeding does not seem very reasonable. At any rate, the late political experiences of Victoria supply political students with instructive and interesting, but we fear we can hardly say cheerful or encouraging, matter for reflection.

THE EASTERN PYRENEES.

MR. SENIOR tells us in the last volume of his entertaining work that, in conversation with a distinguished Frenchman, the latter gravely mooted the advisableness of incorporating with France the Spanish province of Catalonia. It would appear that this was only one of several choice landed properties marked out in the minds of many of the Second Empire men for annexation at a suitable opportunity. On the score of geographical propriety, there was a good deal to be said in favour of annexing Savoy and Nice. Something might be advanced on like grounds for taking part of the Rhine frontier. No two States, however, are more clearly separated by nature than France and Spain. It is indeed quite inconceivable at this time of day that any man aspiring to be considered a statesman, or even a man of ordinary common sense, should seriously propose that the one nation should go over these mountains to possess itself of a province belonging to the other. Such notions were all very natural and suitable in the age of Louis XIV., but many things have happened since then. Both nations, indeed, have reason to congratulate themselves that the Pyrenees exist as a potent geographical expression and a well-defined boundary mark. Each holds now exactly that ground which in strictest geographical propriety should belong to it; one is on this side of a lofty mountain barrier, the other on that side. In no province of Spain lying under this barrier is there any French element which would welcome annexation by France; and the "Peace of the Pyrenees," in 1659, has never been disturbed by any conspiracies on the part of Roussillonais or Cerdagnais desiring to be reincorporated with Spain. When the invasion of Napoleon had been repelled by the united efforts of England, Spain, and Portugal, the ridge of the Pyrenees became once more the limits as defined by that treaty. Moreover, apart from their being so clearly separated territorially, the two peoples are by no means calculated to pull well together; one is too powerful, the other too proud. It is true that the recollection of a certain ethnical affinity, identity of creed, and a similar proneness to be carried away by ardent if fitful enthusiasm in generous causes, will occasionally evoke reciprocal compliments. The recent highly creditable exertions of the Paris press in favour of the sufferers through the inundations in Murcia called forth unbounded fraternal recognition of French generosity and nobility of soul from all ranks and classes throughout Spain; but, when the sentimental fireworks have been let off on either side of the Pyrenees, the situation remains the same. The Spaniards' general estimate of their neighbours' character and of the danger of having too intimate relations with them is capitally rendered in the Spanish proverb, which we give in its French dress, since the French rather like repeating it than otherwise, probably reading therein some recondite compliment to themselves:—"Ne demande pas du feu à un Français, même pour allumer ta pipe—il te portera l'incendie!"

The department of the Eastern Pyrenees went formerly by the name of Roussillon, and it has known many masters. During a long period it was under rulers of its own, called Counts of Roussillon. The last of these bequeathed it in 1178 to the King of Aragon. Three centuries later it was ceded to Louis XI. of France. Again it was recovered by a King of Aragon, but a hundred and fifty years later was finally annexed to France, retaining until the Revolution its appellation of province of Roussillon. With the many objects of interest which this department has to offer to the antiquary, artist, mineralogist, invalid, and epicure, we should have wondered that our countrymen so rarely turn off the high road to Spain to enter it, if we had not often noticed

that they take less trouble to find out the beauties of France than those of countries further away. How many, we should like to know, of the hundreds of English residents at Dinan, Dinard, and on the outskirts of Brittany, have ever explored that astonishing collection of Celtic remains strewn broadcast over the moors hard by? where also grows the very broom which gave our Plantagenets their name and armorial bearings. There are numbers of Englishmen who speak as though they knew the country thoroughly, and whose experience has been confined to visiting a large city at either end of a long line of rail, and on the journey between to catching a peep, in the intervals of sleeping, eating, and novel-reading, at a flying landscape of vines and poplars. It would surprise such as have adjudged France to be a flat, uninteresting country, after a run from Calais to Paris, to learn what variety and beauty of scenery may be found in places off the beaten tracks. But very few, comparatively speaking, of the scores of thousands who each year rush through France do turn off the great highways. Those who do so in search of natural beauties visit the Vale of the Gresivaudan, the gorge of the Grande Chartreuse, or the romantic scenery of the Vosges or Ardennes, or explore Auvergne or the Rhóne with its superb prospects; and their verdict is very different from that of the commonplace tourist. One of the departments least known in its interior by English people is, as we have remarked, that of the Eastern Pyrenees. The western and central portions of the great mountain chain are the annual resort of multitudes of travellers. Some come to drink or dip in various healing waters, others to climb lofty peaks affording superb views, to angle for trout in purling streams of exquisite purity, or to get meagre but novel sport with the gun in return for much hard walking. Nearly everywhere there are good hotels to put up at, and almost always throughout the summer and autumn a sunshine may be enjoyed which is too often denied to the tourist of the Alps. But the eastern end is a *terra incognita*. Till recently the line of rail now connecting the south of France, through Narbonne and Perpignan, with Barcelona and the Spanish northern and eastern system, only ran to the frontier, and a most tiresome journey had to be performed by diligence on the other side. Now that this is changed, the Eastern Pyrenees will probably not have long to wait before they experience and profit by the necessary British invasion. Already the recognized advanced guards under Messrs. Cook have passed through. But this is just what tourists have generally done hitherto; they have passed by on the coast road, without penetrating into the interior. And the coast route gives no fair idea of what is to be seen inland. It cannot compete for a moment in beauty of scenery or colouring with the lovely Corniche road. Salt lagoons stretch away on either side, only relieved at intervals by tracts of brown barren-looking soil, where, however, the vine flourishes. Arrived at Perpignan, the capital of the department, the traveller is struck by the poverty of the hotels for so considerable a town, and by the unsavoury odours, engendered by a visible neglect of all sanitary laws, which pervade the narrow streets. Here we begin to take leave of France proper. Not only do we hear an unfamiliar tongue spoken all round, but such French as is spoken is badly pronounced; the dress of the lower orders has Spanish peculiarities; and the shops display many articles of Spanish production. The market-place is well worth a visit in the early morning, when the newcomer will be struck by the quaint costumes of peasants from the country, and by the immense variety and abundance of produce for sale. If it is autumn there will be a magnificent show of vegetables and fruit. The most exquisite grapes may be bought for a song, as also the luscious white figs called *Coll de Signora*, which no other fig of any kind or clime can match. After Perpignan, as we approach the frontier and come more under mountain shelter, the country rapidly improves, and we enter a zone of vine and olive, of palm, orange, and cactus. It is this district which produces the rich powerful wines of Banyuls, Grenache, Muscat, and, above all, of the superb white Maccabeo; the less costly of which are much used to *corser* or fortify the weaker wines further north. Their generic name is *vins de Roussillon*, and probably some of the vintage really does find its way into the Mas-deu, sold as Masdeu in England; but somehow it seems oftener than not to lose flavour on the road. Perhaps the best wine of the country comes from the slopes about Collioure, where the vines flourish wonderfully on what is bare rock scattered over with sand; and, as rain seldom falls here, the dressers have to depend on artificial irrigation.

The coast line takes us by many spots interesting to lovers of antiquities. Narbonne, the "pulcherrima Narbo" of Martial, was, till recently, when much ancient masonry was abstracted for the making of fortifications and other purposes, a town full of Roman monuments, buildings, and Arab remains. Many important architectural fragments, Phœnician, Roman, and Visigothic, are preserved in the museum. Shortly after Narbonne we come upon Salces with its saline waters mentioned by Strabo. It was at Elne (called Illiberis by the Romans and afterwards Elena by Constantine) that Hannibal pitched his first camp in Gaul. The church and cloisters with their bas-reliefs and very ancient inscriptions are well worth [illegible]ection. After passing the small, picturesque port of Collio[illegible]—the ancient Cauco-Illiberis—we come to Port Vendres (*Portus Veneris*). As this is the only considerable harbour between Marseilles and the frontier, efforts are now being made by the Government to increase its commercial importance; and it will doubtless become the central place of export for a large district. A few miles beyond, the easternmost ridge of the Pyrenees juts out into the Mediterranean at Cap Creus, the ancient Aphrodisium, and we are on Spanish ground.

Besides the road leading into Spain another line of rail runs now from Perpignan into the heart of the department—the line from Perpignan to Prades. It traverses the wide plain of Roussillon, ascending the right bank of the torrential Tet, till it reaches well up into the mountains. It would astonish some of our hardly pushed farmers at home to see with what little cost and trouble man earns a livelihood and competency in these parts. Most Southern peoples are inclined to allow nature to do her full share of the work to be done; and nature works hard about here, filling the valleys with corn and maize, and hemp and fruits, and making a vast, rich vinery of the terraced hill-sides. The terminus of the rail is Prades, which lies just under the gigantic mass of the Canigou, the loftiest mountain in the Eastern division. We would strongly recommend a short sojourn at Prades, especially during the autumn months, when the climate, resembling that of Lombardy at that season, is absolutely perfect. There is an hotel greatly to be commended for its cleanliness and comfort, and enjoying a well-deserved reputation for its irreproachable *cuisine*. We notice that the guide-books are just awake to the fact of the existence of a bathing establishment at Molitg, some five miles distant. The waters are sulphurous, and most efficacious in skin diseases; and in summer and autumn the baths, picturesquely situated, are thronged by French and Spaniards. Some ten miles from Prades are also the baths of Olette. There is here a curious relic of Latin times in the name given to an ancient zigzag mule path—*gradus d'Olette*, or sometimes in modern patois, *graus*. Three miles to the north of Prades is Vernet with another water-cure establishment. From here the ascent of the Canigou may be made without too much difficulty. A magnificent view is obtained from the summit, embracing the plain of Roussillon, the mountains of Catalonia, and a wide reach of the Mediterranean. Excursions should be made to the ruins of the Benedictine Abbey of St. Michael de Cuxa, as also to those of St. Martin du Canigou. The country around is studded with watch-towers, the shells of mediæval castles, and with considerable villages on the hill-sides. Chief in interest among these is Ria, on the road to Mont Louis, which, by the by, is the most elevated garrison town in Europe.

Returning to Perpignan—the starting-point for the interior—the tourist should next follow the road to Amélie-les-Bains, to which it is proposed shortly to lay a line of rail. The route as far as Le Boulou is that of the old post road from Perpignan to Barcelona. Here are several copious mineral springs, with a bathing establishment crowded in summer and autumn. The waters are little known out of the department, but are there very generally drunk, being highly efficacious in complaints of the digestive organs. Just beyond Le Boulou, on the road to Spain, occurs the Col de Perthus—the pass traversed by the army of Hannibal on its march into Gaul, and which later was trodden successively by the conquering legions of Pompey and Cæsar. At Amélie, some ten miles beyond Le Boulou, are sulphur springs which must have been of repute in the time of the Romans, to judge by the remains of baths; and they are much esteemed now in cases of consumption and rheumatism. The French Government has erected here an immense military hospital especially intended for officers, of whom after the Crimean war as many as five hundred were under treatment at the same time. We have always wondered that these sheltered and delightful winter quarters have not been more appreciated by our countrymen. Perhaps one great reason is that there is neither English chaplain nor doctor within a hundred miles or more of the place. One necessary of life is, however, forthcoming—the daily post with the daily *Times*. And there is a telegraph office. Apartments and villas are to be found at very moderate rents. Beautiful walks amid olive and orange, citron, palm, and vine, may be found, and excursions taken to various points of interest in the midst of grand scenery. A few miles beyond Amélie are the baths of La Preste, the waters of which are considered to be of extraordinary potency in calculous complaints.

It has now been resolved to make a railroad into this district, which will not only render the numerous thermal establishments more accessible, but will be the means of opening out its vast mineral resources. For the Eastern Pyrenees have attractions not only for the artist, the *bon vivant*, and the invalid, but for the speculator. We were amused lately on consulting a popular Encyclopædia to learn that iron is to be found in the Pyrenees, but that the mines are of limited extent and the supply of small account. The fact is, the mines, little worked hitherto, cover an immense area—at least in this division of the mountains—and their produce is only limited by the demand. The whole group of mountains lying in a semicircle about the Canigou, which itself is charged with ore, is more or less one continuous mine, producing, where worked, iron of the very best quality. But the mountain paths are so difficult, the distances of the mines from main roads so considerable, and from any railroad so much greater still, that it is easy to understand why comparatively little attention has hitherto been bestowed upon the sleeping treasure. At length, however, the people of these parts are waking up to realize the value of what lies under their feet. As an instance of this we may mention that some years ago a gentleman owning property not far from Olette sold a hill, inside and out, for 150 francs. It seemed of no use or value to him, being a wild, barren bit of ground scattered over with boulders of indifferent marble; and what would

be gained by digging the iron, for which no purchaser could be found in this out-of-the-way corner? At the present time you might offer, and probably in vain, two million francs for that hill. It is in the upper part of the valley of the Tet, and at Prades the railway is now brought within ten miles, and will be brought nearer still. The adjoining iron mine of Escaro is worked by an Englishman, Mr. Sharpe, son of the late eminent architect, who owns also a quarry of marble in the vicinity. There is plenty of room for many more Englishmen whose taste may lie in this direction. Again, when the rail is laid to Amélie, the mines on that side of the Canigou (this mountain separates the valleys of the Tet and the Tech) will increase immensely in value, while others which have only been scratched will be opened up. The most convenient headquarters for persons wishing to explore the mine country about the sources of the Tet would be Prades or Olette; and for those who would visit that of the Tech, either La Preste or Prats de Mollo. For visitors unencumbered with heavy baggage a most charming mountain route over a wing of the Canigou may be taken from Olette to Prats de Mollo, whereby the long roundabout journey by Prades, Perpignan, and Amélie is avoided. Whether or not it is likely that the mines of this region will ever be worked profitably on a more extensive scale is a matter on which we offer no opinion. Undoubtedly, however, the resources we have spoken of are in existence, and the proposed improvement of communications will bring them within easier reach of the main routes of commerce.

ELECTION AMENITIES.

THE lovers of things as they once were have been wont of late years to lament over the comparatively prosaic character which the abolition of the hustings and the institution of the Ballot have given to elections. There is no doubt that a certain decrease in boisterousness is observable, not merely since the days immortalized by Hogarth, but since days which all but the very youngest can perfectly well remember. Only a dozen years ago the general election of 1868 had its full share of disorder; but that of 1874 was, it must be admitted, comparatively quiet. The present struggle has not resulted in any great number of broken heads, yet it has not been all plain sailing either for the rank and file or for the distinguished persons who occupy the position of candidates. Indeed the latter have been on the whole rather unlucky, and in not a few instances must have had any blue mould which may have clung about them effectually dissipated by the application of the old original Irish detergent. The excitable persons who nearly squeezed the breath out of Mr. Cowen's body at Newcastle a fortnight ago did it in pure kindness, and the election frolics which drove Mr. Collins from a meeting at Derby and abruptly terminated the addresses of not a few Metropolitan candidates from time to time, appear to have been for the most part impartial and "promiscuous" in their character. We must go to Scotland and Ireland for instances where the limbs, if not the life, of Parliamentary aspirants have been really in danger, though Cardiff has maintained the pugnacious character of the Principality, and a little incident at Chester last Monday redeems England from the reproach of contributing nothing in the way of a stramash to the history of the election of 1880.

The earliest, and perhaps the most comic, of these incidents was a singular disaster which befell Mr. Pender, the late member, and probably, as he is unopposed, the future or present member, for the Wick Burghs. Like most Scotch borough members, Mr. Pender had to woo the suffrages of a considerable number of small constituencies, two of which, Kirkwall and Stromness, are, it is hardly necessary to say, in the mainland of Orkney. After Mr. Pender had canvassed Kirkwall, he set off for Stromness, and then a quaint scene occurred. We have said that there is no opposition to Mr. Pender. Whether this was taken by the Kirkwallers as an insult, or whether they dislike Mr. Pender personally, or whether a desire came upon them for one of the rather sanguinary frolics in which their Norse ancestors used to indulge, we cannot pretend to say. There is a famous story of that part of the world (whether Orkney or Caithness we forget) which tells how a political debate was cut short by the pithy remark of an orator, "Short rede, good rede, slay we the Bishop." Somebody appears to have said to the Kirkwallers, "Short rede, good rede, drown we the candidate." They set about this diabolical intention with a cunning equally diabolical. It is a customary compliment to take the horses out of a member's carriage, and draw it. This the cunning Kirkwallers pretended to do, and, though there were suspicions, the candidate seems to have thought that he was going to have what reporters call an ovation. The human horses, however, proceeded to run the carriage down into the sea, which would probably have placed Mr. Pender in a condition to appreciate the feelings of the victims of the Tay Bridge disaster. Fortunately for him the carriage stuck, and the attempt failed. Thereupon the crowd smashed the windows, also Mr. Pender's hat, and the unfortunate ex-member had to address mollifying words out of the window, like Mr. Gladstone, but in less happy circumstances. This gave the better disposed among the crowd—the *viri pietate graves*—time to work upon its feelings, and no further attempt was made to set a late member of Parliament afloat on the ocean wave in this novel fashion.

The sufferings of Mr. Pender were, however, a mere joke to the sufferings of Mr. Parnell at Enniscorthy on Sunday. Of these latter it seems hardly lawful to speak in plain prose. The best blank verse would scarcely be too good for this remarkable example of the wrath of Nemesis, which has, as we learn from a resolution of the Nationalists of Loughrea, caused "a wave of profound sorrow to sweep over the country at the lamentable degeneracy shown by the inhabitants of once gallant and glorious Wexford." There will always be differences of opinion, and, for our part, we should have thought that the inhabitants of gallant and glorious Wexford had shown themselves to be broths of boys entirely. It is well known that Mr. Parnell is carrying out on a large scale a kind of parable of the sower, taking candidates and scattering them broadcast about the land. Enniscorthy, we fear, is but a stony soil. For some reason best known to Mr. Parnell, the Chevalier O'Clery, who represented the county with that full approval of the priests which a Papal Zouave who has fired his shot—we believe Mr. O'Clery did fire his shot—for the temporal power is bound to receive, appears unsatisfactory to the obstructionist chief. So Mr. Parnell took two candidates and went down with them to Enniscorthy. Ominous signs, we are told, showed themselves on the way. Ravens croaked on the wrong side; that is to say, when they came to the town of Ferns their reception was much less cordial than that accorded to the Rev. Joseph Murphy. The world may know nothing of the Reverend Joseph, but the tale will show that he is not one of its least men. His first stroke showed the master hand. While Mr. Parnell and his candidates were idly marshalling green flags, Mr. O'Clery and six priests, among whom the Rev. Joseph Murphy and a certain Father O'Gorman were prominent, seized and garrisoned the platform, from which a sacrilegious Parnellite in vain endeavoured to dislodge them. The Reverend Joseph then comprehensively announced that "he stood there to resist the dictatorship of every man," a sentiment than which it is difficult to imagine anything more noble or less clear. The enemy advanced, and Mr. Parnell, reckless of Nemesis, attempted to mount the platform. Only Homer, the unknown author of the romance of *Fierabras*, or Thackeray, could fitly describe what followed. To put it unambitiously, there was a free fight, and Mr. Parnell got very much the worst of it. The crowd, if they did not smite him on the nose, as Smith O'Brien was smitten, caught him by the legs, smashed his hat, tore his nether garments, and so forth. In short, had it not been for the magnanimous interference of the Reverend Joseph, as merciful as he was strong, Mr. Parnell would apparently by this time have been resolved into his constituent elements, and Ireland would have mourned her hero. When something like an audience had been obtained, the insults of the crowd were even more cruel than their injuries. They entreated Mr. Parnell to take off the hat which they had smashed; they bade him mend the garments they had torn. Finally, he was mildly informed that he had had "a warning," and was let go, though a second attack seems to have been made on him before he got to the train. History records few more awful examples of the mutability of human affairs than this. A few short hours before, and Mr. Parnell was the idol of mobs; "it was roses, roses all the way"; and now the many-headed substituted for roses blows of the alpeen, which were only averted from the sacred crown of Charles Stuart Parnell by the good offices of the Rev. Joseph Murphy, his conqueror and benefactor.

After this splendid demonstration of that ineradicable inclination to quarrel among themselves which is one of the most attractive and convenient characteristics of Irish patriots, it seems tame to hear that at Dundee an unsuccessful attempt was made and frustrated by the police to put a certain Mr. Blair—or was it Mr. Barry?—into the docks. In Ireland they manage these things better, and their attempts are not unsuccessful, while the police simply survey the scene. The Chester affair was a little better thought out. A certain mysterious Mr. Malgarini—who somehow confusedly suggests Mr. Turnerelli, *quia desinunt ambo in i*—seems to have thought that the battle between Messrs. Raikes and Dodson and their secords might as well be complicated by his own candidature, and suddenly appeared on the scene. In his case the hackneyed phrase has full propriety and local colour, for Mr. Malgarini—not inappropriately, perhaps—affects theatres as places of oratory. When the curtain of the theatre rose Mr. Malgarini was visible in evening dress and white gloves. The free and independent electors opened the discussion with a salvo of rotten eggs, and then went for Mr. Malgarini, who retired in disorder to his hotel. This vote of want of confidence seems to have been taken as decisive, for among the candidates nominated for Chester on Tuesday we do not observe Mr. Malgarini's highly euphonious name.

Such are the chief breaches of the peace which have occurred up to the time of our writing. They will no doubt—in Ireland especially—be supplemented by a good many more before the elections are over. In the abstract, of course, all these things are highly discreditable; and when they are got up and organized against special candidates or special parties by their opponents, no words can be too strong for them, except in Ireland. We do not know, however, that there is much need to affect sorrow or indignation at the conduct which resulted in Mr. Parnell's discomfiture. For the better part of a year he has been covertly urging his hearers to do to others pretty much what has now been done to him, and it would be mere hypocrisy to pretend to be sorry that he has been hoist with his own petard. The case is a case of diamond cut diamond, and of the two precious stones, we incline to prefer the Reverend Joseph. The cases of Mr. Pender and of the unfortunate Dundee candidate, who seems, like Mr. Malgarini, to have accepted the verdict of the people and refused to be

nominated, are somewhat different. The North Sea was clearly not intended by nature, nor the Dundee docks by the Harbour Board of that respectable town, as receptacles for stray candidates. The test of swimming or sinking under such conditions is now recognized by the best authorities as indecisive and improper even in the case of witches; and we do not see that there is any greater appropriateness in it when applied to Parliamentary aspirants. The exuberant fancy of the electors of New Ross, who playfully stretch ropes across their streets in order to trip up candidates' horses, is another instance of an overstepping of the limits of becoming mirth. However, the doctrine that all is fair in love, war, and elections seems not to have even yet lost its hold on the minds of a considerable portion of the British nation. As the candidates generally pay for all the damage that is done, the high principle of men who would not like to cause their neighbour loss is satisfied, while the bodily inconvenience which is sometimes caused to that neighbour is overlooked as trifling. There is probably also a feeling in the breast of the illiterate elector that the candidates themselves are fair game. It is for their party to protect them if it can. All which is no doubt very wrong, and deserves the sternest reprobation. When we think of Mr. Pender sadly voyaging across to Norway in his possibly unseaworthy carriage, or of Mr. Blair fathoming the Dundee docks, or of Mr. Malgarini with his fair white gloves dyed with the kindred hues of orange and of egg, it is impossible not to feel indignant and pitiful. But then the scene at Enniscorthy rises before the mind's eye, and, viewed through the medium of Mr. Parnell's discomfiture, rioting somehow looks like a civil game. The late member for Meath has a good many sins to answer for; perhaps not the least is that he has taught peaceful and law-abiding Britons to look with tolerance on breaches of the peace and the law. It is impossible to regard the hat, or the coat, or the other garments of Mr. Parnell as we feel they ought to be regarded; human nature is too weak for that. It was, as in a parallel case recorded by Mr. Browning, "sad and bad and mad" of the Enniscorthyites to rabble Mr. Parnell; but, somehow or other, the knowledge that he was rabbled is not wholly disagreeable. This is wrong, but it is human nature.

THE DRAGOMAN IN CAIRO.

THERE have been many searchings of heart lately in the chief city of Egypt on the great donkey-boy question. Everybody who knows anything about the Turks knows that, sluggish as they are to make laws or institute reforms, when they rouse themselves they are very likely to overdo the task, whatever it is. They are very likely to err on the side of severity in punishment for small offences. Thus, in Cairo a fine of twenty francs is the prescribed penalty for the cabman's crime of "crawling." It need hardly be observed that such a regulation cannot be enforced, and a recent attempt to put it into practice caused a strike among the hackney coachmen, which lasted, to the great inconvenience of the public, for several days. A small fine—say, sixpence—would discourage the practice sufficiently. The same tendency to overdo legislation is exemplified in the regulations under which dragomans and donkey-boys pursue their several vocations. People who have visited Cairo can never forget the donkey-boy. He is one of the central features of the place. To travellers he is the incarnation of everything Oriental, strange, convenient, civil, and wonderful in Egypt. His activity, his ready tact, his good temper, his avidity for backsheesh, but, above all, his knowledge of English, are astonishing. You are addressed unexpectedly in remote streets in a very good imitation of your native tongue, "How you do, Englishman; want donkey?" When you have hired him, the boy does everything for you. He makes your bargains at the bazaar. He prescribes the proper tobacco for your cigarettes. He points out the local celebrities. He tells you the latest news, the last scandal about the Khedive, the name of his donkey, the date of an approaching festival; and, in fact, everything you want to know. Many Englishmen, accustomed to winter in Egypt year after year, retain a donkey-boy for the season, and in cases of severe illness we have known one of these extraordinary factotums turn into a tender, attentive, and vigilant nurse. It would surprise many people who know the virtues of the donkey-boy to be told that almost all the accomplishments which make him valuable to the traveller are exercised in defiance of the law. If you return to Cairo a second time, it is very probable that you will find your favourite donkey-boy in prison when you arrive. The law, made in the interest of the dragomans, is that a donkey-boy may not speak English, may not interpret, and may not pay money for his employer. Such a law, like the law about hackney carriages, cannot be enforced with any regularity, but it is often made the instrument of oppression, either through envy or spite, and, in days now happily gone by, through tyranny. A boy thrown into prison for an indefinite period—for there is no Habeas Corpus Act in Egypt—used to be tempted to enlist. Many a recruit was thus obtained and sent to perish in Abyssinia. The dragomans, who think that they only should be allowed to interpret, have not however been able to prevent the donkey-boys from learning English; and of late years, on many occasions, travellers have found it possible to go up the Nile, or on other journeys, with the help of a donkey-boy only and no dragoman. The donkey-boy sometimes develops into a dragoman, but this can only be if he has learned to write and cipher; and some of the most accomplished "boys" remain "boys" to the end of their lives.

As a matter of fact, the average donkey-boy speaks better English than the average dragoman. A dragoman who can write English is indeed a rarity, and, so far as we are aware, but one single dragoman has followed the fashion of English travellers and rushed into print. He is not an Egyptian, but a Syrian, of the name of Morroni, and has written a *Special Guide-Book* for Cairo and its environs, which is in many respects one of the most curious works it has ever been our fortune to meet. Mr. Morroni introduces his book with a modest preface:—"Many years spent in Egypt, in the capacity of Contractor and Travelling companion, have made me acquire such an experience, both of the country and of the requirements of travellers, that I consider a special guide-book for Cairo as a most useful, and, I may say, an almost indispensable publication, for English and American Visitors." The volume opens with a brief historical sketch, from which we learn some interesting and hitherto but little known facts. Menes was, it seems, the same as Misrahim, the son of Ham. From the expulsion of the Shepherd-kings until the arrival of Joseph the son of Jacob "there is a chasm in Egyptian history." In 525 B.C. "Cambyses, Emperor of Persia, added Egypt to his other provinces, and continued attached to Persia for 195 years." Cambyses' attachment to Persia was apparently a love which even death could not extinguish. A geographical sketch follows the historical, and then the guide-book proper begins with this axiom:—"To visit Cairo, its monuments and environs, it requires seven days, which ought to be employed as follows, viz." Then come the usual programmes, among which we are recommended to see "Boulac's Museum and town," and told that on the "5 Day, It is necessary the Whole day to visit the Petrified Wood and Mokattam." Another whole day is required to "visit the Nile Dam," and the seventh and last day is reserved for the Pyramids of Gizeh and Sakkarah, "for this reason that, after the ascent of the great Pyramide and 5 hours ride to Sakkarah and back to Gizeh where your carriage remains waiting, no one will for several days after feel inclined either to walk or ride." It does not seem to occur to our dragoman that some people may have a journey to make on the morrow, and that for those who propose to remain longer at Cairo it will be better to see Sakkarah and Gheezeh on different excursions. We next come to the description of Cairo. The old town is a labyrinth of winding streets, "where people are constantly forced to their stops, and where everything that strikes the eye is an object of surprise. . . . A curions sight are also the innumerable and curiousity ornamented porticos." After the old town, we visit the new. "The second town to wit; that of Ismail Pacha, with its fairy-like gardens, its avenues, its theatres, and its fine wide streets lined with magnificent buildings, recalls to the mind the aspect of the finest European cities and symbolizes the connecting link which now binds Africa to Europe and the East with the West." The wall of Cairo totters, and "will in consequence of the numerous transformation of the city which is daily undergoing, end by dissappearing altogether." Mr. Morroni then takes us to the principal mosques. That of Sultan Hassan excites his admiration. It stands "at 99 feet above the level of the Mediterranean by adding 97 feet to the height of the minaret we obtain the same attitude as that of the town of Assooan. . . . This monument formely surrounded by horels and ugly buildings has been disengaged and it actually stands forth in all its majestic beauty." To the Mosque of Kaloun "persons attacked with jaundice, consumption, and barren women," repair to seek for remedies, "which are by some people considered efficacious." The Mosque of Sitti Zenab "has an elegant coquettish and almost feminin aspect." But Mr. Morroni's highest admiration is reserved for the Mosque of Mohamed-Aly in the Citadel. "Its hight, the elegance of its minarets, the profusion with which alabaster has been lavished on all sides, the majestic size of its cupola, and the hardihood of its general design' are the causes of his admiration, and awaken in his bosom "the remembrance of the illustrious man who lies beneath its dome." We then visit the well "which Joseph son of Ayoub or salading first Ayoubite Sovereign caused to be dug." Next our attention is called to the view. Cairo is in the foreground, with its suburbs. Beyond, and "opposite to Giseh stands the Great Pyramid of that colossal monument which has withstood the action of time and of every agent of distruction." Further south "can be descrived the Pyramides of Sakkarah." A ramble round the bazaars gives Mr. Morroni further opportunity for the display of his peculiar genius. "In general the sword-blades and gun-barels come mostely from Europe; they being merely fitted up in this country." There is a curious remark on another subject. Lane, if we remember rightly, describes the decapitation of a criminal. Mr. Morroni only says, "Cairo also possesses a new establishment which reflects great credit on the Minister who conceived the idea and followed up its executions." He goes on to give a not very *à propos* account of the public library.

On the longer excursions Mr. Morroni is equally entertaining. At Rhoda we see a palace which, "with its garden-walls overlonging the river, is a very elegant dwelling." At Kasr en Nil is "the fine iron bridge on the Nile 1,500 feet long, with a division or partition 100 feet long piroting on its axes." Over this remarkable structure we proceed to the Great Pyramid, the ascent of which may be made by 206 steps. "Both during the ascent and descent one is forced to make numberless zig-zags, and to seek for places

offering favourable anfractuosities." Within the pyramid "it is necessary to climb by scrambling and crambling on one's hands!" The Sphinx is formed "by a natural rock, to which the Egyptians gave the autward appearance of that symbolical animal." The rock being composed of layers, "advantage was taken of the internal existing between them to trace out the mouth." Of Sakkarah, too, there is a full description. "In the center of this Pyramide is a large well, the top of which is on a line with the basis of the Pyramid, and descending far into the earth the age of this monument and name of the King are unknown." We are also taken to visit the abortive "barrage" on which Mohammed Ali spent so much money and so many lives, and after all left unfinished. Mr. Morroni overlooks this fact when he describes the festivities which took place when the Viceroy opened the works:—

Then all under-handed opposition ceased, and the Arab's poets sang the praires of Mohammed Ali and celebrated the triumph of art over the waters. The first stone was laid in great poump and ceremonied by H. H. himself in presence of the Cheifs of the Religion muttering their prayers over the corpses of 50 buffaloes slain on the spot according to the ancient habits and in presince of the Consuls of all the Foreign Powers and of all the high native officials.

Nor were the corpses of the fifty "buffaloes" enough. In the evening 15,000 soldiers partook of an immense feast "prepared by more than 300 cook's busy roasting whole sheeps and oxen." We reluctantly pass by the rest of Mr. Morroni's account of this singular festival, nor shall we quote from his "Musulman Almanack." The only very important correction we would ask him to note for his next edition is that of a statement almost on his last page. At the festival of the Prophet it is not the "Chek el Bakry" who "crosses on horseback the bodies of the faithful," but the Sheyk of the Saidieh dervishes. At the end of the little volume are some advertisements which the reader must by no means skip. He will learn strange things of "dresses adopted for gentlemen," of the Germam dispensary, of the British Pharmacopocia, of a restaurant which offers great confort for its excellent cusine, of ready-made closing and fancy articles, and many other wonderful things. It is a pity no literary donkey-boy exists, for only a donkey-boy could hope to rival, in style and information, the work of Mr. Morroni.

THE PRICE OF WHEAT.

ONE HALF of the agricultural year has this week come to an end, and it is instructive to look back on the course of the wheat market since its beginning. The last harvest was by general consent the worst since 1816—a period of sixty-three years, or the lifetime of two generations. And it was bad, too, all over Europe. Even Austria-Hungary, usually an exporter, is this year an importer; and Russia, hitherto the second greatest source of our supply, has this year but little to sell to us, while several of her provinces are in distress, and some are even suffering from famine. It was natural, therefore, when the full extent of our disaster was realized in the autumn, that very gloomy forebodings should prevail as to the winter then approaching. It may be worth while to remind our readers of the estimates then put forward on the very highest authority. The wheat yield at home was about two-thirds of the average in quantity, while the quality was so bad that its real bread-making value might be taken at about three-fifths of an average crop. Taking this as admitted, it was estimated that we should require to buy from foreigners in the course of the year from 16 to 18 million quarters. From 1866 to 1872 our imports never reached 10 million quarters, and even in 1876-77 they but slightly exceeded 12 million; the estimate, therefore, was that we should need nearly 50 per cent. more than we had required three years ago. In the two agricultural years immediately preceding the current one we imported about 14½ million quarters, and when these enormous purchases, never previously exampled, seemed likely to be largely exceeded, very grave apprehensions were entertained of the effects upon the condition of the people. What made the matter still more serious was that, as we have already said, the harvests all over the Continent were very deficient. It was estimated that France would need about 8 million quarters; and that Austria-Hungary, Germany, Holland, Belgium, Italy, Switzerland, Spain, and Portugal, would require among them 10 million quarters more. Thus the wants of the Continent were estimated at about 18 million quarters, making the requirements of the whole of Europe from 34 to 36 million. On the other hand, it was estimated that the surplus which America had to sell was about 24 million quarters, and that Russia could dispose of about 5 million, making together 29 million quarters. Assuming that Chili, Algiers, India, Australia, and other countries would make up the deficiency after North America and Russia were exhausted, it still seemed to many persons an irrefutable conclusion that the price of wheat during the year must stand very high. As a matter of fact, however, it has not done so.

Our readers are aware that for the purpose of fixing the Tithe Rent Charge, a record is kept of the average price of wheat in 150 towns of England and Wales, and is published weekly in the *London Gazette*. Now we find that at the end of August last the price averaged 49s. 3d. per quarter; in October it had risen sevenpence; but it then began to fall, and in February had got as low as 43s. 1d.; since then it has begun to rise again, and last week it was as high as 47s. 3d.—still, however, two shillings lower than in October. How very moderate even the highest of these quotations is will be understood when we add that, for the thirteen years ending with September last, the average price was 53s. 3d. Thus we arrive at the strange fact that during the six months immediately following the worst harvest known in England for sixty-three years, and with the whole Continent bidding against us in the markets of the world, the price of British wheat has been lower than the average of the previous thirteen years. No doubt it is true that the exceedingly bad condition in which the crop was got in last autumn must be taken into account. The small yield and bad quality, due to the incessant rains while the ear was on the stalk, were aggravated by the inclement weather of the harvest season. The grain consequently was so damp and soft that it required to be mixed with foreign wheat before grinding, and therefore fetched a lower price than it would have commanded had it been saved in good condition. Still, even when full weight is given to this consideration, the range of prices during the six months gives cause for well-founded surprise, and all the more because a powerful and well-sustained effort has been made to enhance prices. A "ring," as a combination of persons to rig a market is called in the United States, was formed in Chicago as soon as it became evident that the harvests of Europe had failed. This ring bought up immense quantities of wheat, and has held them back in the hope of realizing a large profit. For a time the speculation was attended by a measure of success. At the end of August the price of red winter wheat at New York was $1 12c. per bushel; it rose steadily during the succeeding months, until in December it reached $1 58c. per bushel, being a rise of over 41 per cent.; since then it has fluctuated widely, but the general tendency has undoubtedly been downwards, and this week it is as low as $1 39c. per bushel, being a fall from the December quotation of just 12 per cent. It will be seen that the movements in price on the two sides of the Atlantic are not in parallel lines. In England the maximum point was touched by British corn in October, after which there was a steady decline; in New York, on the contrary, the highest level was not reached till December. In England, again, the tendency of late has been upwards, though to a moderate extent; whereas in New York the past fortnight has witnessed a very sharp fall. The explanation is partly, no doubt, that the home wheat now coming to market is in better condition than that previously sold; but it is chiefly to be found in the fact that the withholding of supplies by the Chicago ring has induced purchasers to buy only from hand to mouth. Knowing that immense stocks are held in America, and must sooner or later be sold, buyers have taken only just enough to satisfy their present wants, calculating that as the year advances prices must be forced down by the bringing to market of the stocks now held back. In following this policy they have necessarily allowed their own stocks to run down, and have been willing to enhance their bids for supplies ready for delivery. On the other hand, the ring, seeing the year running away, are no longer so confident of success as before, and are tempting purchasers by coming down in their terms. Thus the knowledge that large stocks were withheld from the market has helped to defeat the plans of those who withheld them.

The course of prices which we have been tracing shows most strikingly how little dependent this country is, not only on its own harvests, but on any particular source of its foreign supply. As sixty-three years have elapsed since England has suffered from so bad a harvest as that of last year, it may reasonably be hoped that a long period will again pass away before she is visited by a similar failure. Moreover, it is in the highest degree improbable that all Europe as well as England will soon again pass through such a trial. The experiment of free trade has thus been put to the severest test, and has borne it most successfully. So long as we retain the command of the sea, we may now rest satisfied that the country is safe against such an enhancement of the price of food as would press heavily on the working classes. Nor need we fear an artificial withholding of supplies by the greatest foreign producer. We have seen how little effect combination in America has had upon prices, although the Russian surplus for export was exceptionally small, and the rest of Europe were buyers instead of sellers. But it will be long before America can again have such pre-eminence in the market. Yet, even under these exceptional circumstances, the area from which we are now supplied is so enormous that it has neutralized Russian deficiency and American combination. As years go on, that area will increase more and more. Already we receive a considerable quantity of wheat from India, and an advance of a very few shillings per quarter would bring us much more; while every improvement in the communications of the wheat-growing districts with the sea will enable India to lay down wheat in the London market more and more cheaply. So, again, the growth of population in Australia, and the consequent extension of the area of cultivation, will rapidly increase the exports from our colonies there. Lastly, railway construction, better government, the accumulation of capital, and the like, will increase the surplus produce of such countries as Egypt, Roumania, and the South American Republics. The members of the Chicago ring did not g
attention to these facts, and they miscalculated accordingly.
erred in another way also. Because last year with an average harvest we imported 24½ million quarters of wheat, they concluded that this year, with a harvest one-third below the average, we must import at least 28 million quarters. But they forget that last year

the price was exceptionally low, and that a serious rise might be expected to check consumption. Last year the cheapness of wheat induced people to use it instead of inferior grains; this year its comparative dearness puts a stop to this, and the change enables buyers, as we said above, to purchase only from hand to mouth.

As regards the future course of the market, it seems probable that the price will not be very much lower than it is at present. Europe still needs very large supplies, and of course will have to pay for them. But, on the other hand, the time is fast approaching when the new harvest will begin to ripen in some parts of the United States. The indications are, it is said, that the growing crop will be superior even to the last. According to returns published at the end of the second week of March by one of the Chicago papers, the area under winter wheat in the States of Illinois, Michigan, Indiana, Ohio, Kentucky, Missouri, Wisconsin, Nebraska, Kansas, and Iowa exceeds by about fifty per cent. last year's acreage, and in eight out of the ten States the condition of the plant was excellent. From the rest of the country the reports are equally favourable. At home, too, and throughout Europe, the favourable weather of the past month promises well for the result of the next harvest. Under these circumstances, the members of the Chicago ring will naturally be anxious to get rid of their stocks without loss; and we may expect, therefore, that the American exports will from this time forward be large. Should the summer be exceptionally favourable, and the harvest very early, there may even be a considerable fall in price; for buyers in Europe will feel their advantage and hold back, while sellers in America will be eager to realise on any terms rather than have their stocks left upon their hands. But of course we have no right to count upon exceptionally favourable circumstances. If the summer is an ordinary one, and the harvest takes place at the usual time, the likelihood seems to be that prices will not drop much below their present level.

REVIEWS.

LIFE OF THE PRINCE CONSORT.*

SIR THEODORE MARTIN is to be congratulated on the completion of his arduous and delicate task, though he may perhaps feel, like Gibbon on his terrace at Lausanne, that the discontinuance of a customary occupation causes a feeling of regret, as on parting with a friend. Of the industry, the literary skill, and the good taste with which he has written the Life of the Prince Consort, there is, except among a few party politicians, little difference of opinion. Throughout the work, courtly reticence has been reconciled with independent judgment, and sincere appreciation has never expressed itself in the language of flattery. It is perhaps fortunate that the concluding portion of the book furnishes little occasion for controversy. The factious folly which discerned in the revelations of the previous volume a supposed tendency to usurpation on the part of the Crown has already collapsed. It happens that in a letter now published, and written to the Princess Royal in 1860, the Prince Consort had unconsciously anticipated and answered the vulgar charge of personal government. The Princess had sent him a memorandum of her own in favour of Ministerial responsibility, in which her father heartily concurred. He added that the responsibility of Ministers, involving the ultimate right of decision, was the correlative of the maxim that the King can do no wrong. "Why should a transgressor of the law of the State find protection in the mere will of the sovereign? Let this be so, and all law and justice must come to an end." As to "the patriarchal relation of kings to their people, and as to personal government," he said that "the patriarchal relation is pretty much like the idyllic life of the Arcadian shepherds, a figure of speech and not much more." Monarchy from the days of Attila to those of Louis XV. "was as little like a patriarchal relation as anything could be. On the contrary, it was sovereignty based upon spoliation, war, murder, oppression, and massacre." Again, after the fall of Napoleon, "The betrayed peoples were required to become good children, because the Princes styled themselves good fathers. The July Revolution, and all that has taken place since then, sufficiently demonstrate that the peoples neither can nor will play the part of children." The Prince Consort could not have guessed that the constitutional acceptance by the Queen of the advice of a Minister commanding a large majority in Parliament would have been denounced as an undue exercise of personal government. He reserved to himself the right of forming and expressing an independent judgment on the opinions and conduct of the Ministers, but in all instances he acquiesced in the decision of the Cabinet as final. Lord John Russell, amongst others, furnished him with sufficiently tempting occasions of criticism. In one of his Notes Lord John gave offence to nearly all the European Governments, by unnecessarily vindicating as consistent with international law the utterly lawless, though morally justifiable, enterprise of Cavour and his King against Central Italy and Naples. A more prudent statesman, while he approved of the result, would have relied for apology on extraordinary circumstances constituting political necessity. Lord John Russell took the opportunity of justifying on general grounds acts which might have formed a dangerous precedent. "The craving," said the Prince, "of individual statesmen to thrust themselves into the van in the general movement, and to make themselves conspicuous, is a constant temptation to mischief." "Sir George Lewis," who, it may be remarked, of all statesmen of the time most nearly resembled the Prince Consort in moral and intellectual temperament, "said to me lately, 'I find that the Cabinet is an institution intended to prevent individual Ministers from immortalizing themselves at the expense of the country.' This would be a valuable institution, if it ever fulfilled its destiny."

In the last two years of the Prince's life, which form the subject of the concluding volume, there was an unusual lull in party politics. The contest for office had been decided in favour of the Liberals in 1859; and the wise selection of Lord Palmerston as Prime Minister in preference to his rival made the Government generally popular. Lord Derby and Mr. Disraeli, at the head of a powerful Opposition, were content to suspend for the time the struggle for office. As they well knew, Lord Palmerston had greater facilities than any Conservative Minister for restraining all tendencies to innovation. He was indeed compelled to allow Lord John Russell to amuse himself by introducing a Reform Bill in the Session of 1860; but after the second reading, he complacently informed the Queen that "dislike of the Bill is a growing feeling in the House, and not confined to the Opposition side." Later in the year Lord John Russell himself discovered that he had committed an anachronism in attempting unseasonably to renew in the same field the cherished triumph of his youth. In a letter to Lord Palmerston he confessed that "the apathy of the country is undeniable, nor is it a transient humour. It seems rather a confirmed habit of mind." Lord Palmerston must have congratulated himself on his prudent resolution to allow his restless colleague free scope for the indulgence of his prejudices. His differences with another and still more unmanageable colleague were so notorious at the time as perhaps to render unobjectionable Sir Theodore Martin's reference to the internal dissensions of the Cabinet on the paper duty. In one of his late speeches Mr. Gladstone recapitulated the story for the purpose of exposing the House of Lords to odium, with a conventional mention of Lord Palmerston as the Minister who revenged himself in 1861 for a check inflicted in 1860. The Prime Minister, in fact, as Mr. Gladstone well knows, highly approved the rejection by the House of Lords of the Bill for the repeal of the paper duty. The smallness of the majority for the Bill in the House of Commons "may," as Lord Palmerston wrote to the Queen, "probably encourage the House of Lords to throw out the Bill when it comes to their House, and Viscount Palmerston is bound in duty to say that, if they do so, they will perform a good public service." Mr. Gladstone's opposition to the loan for fortifications, which was nevertheless effected by his chief, was also well known at the time. He had, notwithstanding his eloquence and his great financial success, little or no influence in Lord Palmerston's Cabinet; but he was more or less consciously establishing his position as the future head of a party which greatly changed its character after the death of Lord Palmerston, Lord Herbert, the Duke of Newcastle, and Sir G. Lewis. The Government during 1860 and 1861 contrived to deal with its own internal rivalries; and it was seldom assailed by the Opposition. On foreign affairs its leading members were united. "The two old Italian masters," as Prince Albert, in a phrase invented by Lady W. Russell, called Lord Palmerston and Lord John Russell, heartily sympathized from first to last with all the movements which ultimately resulted in the establishment of Italian unity. The Prince Consort, though he was not unfriendly to the cause of Italy, had by this time learned profoundly to distrust the vacillating and impulsive policy of the Emperor of the French. He was less surprised than the Ministers at his annexation of Savoy and Nice, on the pretext of the acquisition by Victor Emmanuel of the Tuscan Duchies. Lord John Russell's disappointment found expression in an indignant speech which was afterwards followed by angry correspondence, and even by threats of war on the part of the French Minister. With dangers of this kind Lord Palmerston knew how to deal. He informed Count Flahault that, if the French Government really desired war, the challenge would be accepted, and that he thought that the result might perhaps be favourable to England. From that time to the end of his administration and his life he was not troubled with further menaces of the same kind.

The annexation of Savoy, while it gratified the national feeling of France, inflicted but little loss on Italy; but it caused just uneasiness by the precedent which it seemed to establish of disturbance of the territorial arrangements which had then existed for nearly fifty years. Those who were interested in European politics twenty years ago remember the incessant agitation caused or encouraged by Napoleon III. for the re-arrangement of the map of Europe. From time to time pamphlets appeared at Paris, with real or supposed official sanction, proposing additions of territory, sometimes to Austria, and sometimes to Prussia, in compensation for sacrifices which were for the most part not clearly defined. It was understood on all sides that the various schemes related to the recovery by France of the frontier of the Rhine; and it was probably in the hope of commencing some negotiation on the subject that the Emperor proposed to visit the Prince Regent of Prussia at Baden. The design was baffled by the invitation of many German Princes to assist at the reception of the Emperor; and it was not till after many years that overtures were made on either side for the

* *The Life of His Royal Highness the Prince Consort.* By Theodore Martin. Vol. V. London: Smith, Elder, & Co. 1880.

spoliation of weaker neighbours. Another danger to peace was caused by the designs against the Austrian possession of Venetia, which, after the marvellous success of his Neapolitan enterprise, were loudly proclaimed by Garibaldi. There was no doubt that the attack would be easily repelled; but it was uncertain whether France would afterwards interfere to prevent the Austrian occupation of Lombardy. The ascendency which Cavour ultimately established over the impetuous adventurer saved the new-born monarchy from imminent peril. To the Prince Consort no foreign politics were so interesting as those of Germany. He deeply regretted the animosity which was caused between Prussia and England by the wanton and ignorant attacks of the press, and especially of the *Times*, on the German Governments and nation. He had through life retained the well-founded conviction that the regeneration and unity of Germany depended absolutely on the extension of the influence of Prussia. No discredit is thrown on his sagacity by his failure to foresee the methods by which Prussian predominance was destined to be attained. The Prince took every opportunity of impressing on the Prince Regent, afterwards King, and now German Emperor, that Prussia ought to secure the confidence of Germany by setting an example of constitutional freedom. He regretted the disregard of legislative control in the organization of the army, which nevertheless after his death enabled Prussia to expel Austria from the Confederation, to acquire possession of Schleswig-Holstein, Hanover, and Electoral Hesse, and after the victorious French campaign to re-establish the German Empire. The road to unity through constitutional freedom might possibly have led to the same point, but it would have been much longer. The hints from time to time suggested in the *Times* that the Prince was devoted to German dynastic politics, to the detriment of English interests, were as unworthy and as baseless as the agitation against personal government which not long since attained temporary and scandalous notoriety. The last public service which the Prince rendered to the Queen and to his adopted country was the introduction of one or two conciliatory sentences into the despatch addressed to the American Government on the occasion of the *Trent* outrage. The lawless act of an American officer had been publicly approved by the House of Representatives; and nearly every town in Massachusetts had bestowed its freedom on the offender in reward of his insolent conduct. There is reason to believe that the Cabinet had almost resolved to refuse reparation, and that Mr. Lincoln overruled his advisers. A vote of the body which not long since gave a complimentary reception to Mr. Parnell had perhaps no political significance. The blustering language of the despatch in which Mr. Seward conceded the just demand of the English Government might perhaps have been employed to justify a refusal, if Lord Russell's peremptory draft had not been corrected by the Prince Consort. An additional reason for courtesy in the form of remonstrance had been furnished by the immediate despatch of reinforcements to Canada. The English Minister at Washington had warned his Government that vigorous preparations for war afforded the only prospect of maintaining peace.

The future popularity of Sir Theodore Martin's work will perhaps depend less on the valuable materials for history which it contains than on the biographical interest attaching to a record of a singularly faultless character. The consciousness of great intellectual power combined with indefatigable industry may perhaps sometimes have tempted the Prince to assume an unduly didactic attitude. The published fragment of the Life of Bishop Wilberforce contains a prelection by Prince Albert on the duties of an English bishop which must have amused the humorous and courtly prelate, as addressed to a great ecclesiastical dignitary by a lay foreign Lutheran of six-and-twenty; but in his communications with the Queen's Ministers the Prince seems to have appreciated more justly their position and his own; and his knowledge of Continental affairs enabled him to give useful information even to experienced statesmen. The respectful tone in which he is addressed by all his correspondents is evidently suggested by genuine recognition of his ability and knowledge as well as by formal deference to his rank. Lord Palmerston, with whom the Prince Consort had once engaged in an injudicious contest for influence, appears during his last administration to have greatly relied on his mature judgment and knowledge. Attentive students of biography know that letters frequently illustrate the character of the recipient as fully as those which he writes. In the case of the Prince Consort the contributions of his correspondents are especially valuable, because his own letters relate principally to public business. His letters to the King of Prussia are in the nature of State papers, and even his confidential communications with Baron Stockmar have something of the character of disquisitions. Of the kindliness of Prince Albert's nature, and of the warmth and tenacity of his domestic affections, Sir Theodore Martin is able to furnish ample descriptions. His acknowledgment of the generous confidence which has enabled him to write with independence is probably as well founded as it is evidently sincere; but in his peculiar circumstances the biographer must have submitted to voluntary restraints which would not have been imposed upon him by external authority. He could not properly criticize a character which, as it was known, must have been subject to foibles and defects. His sources of information perhaps supplied inadequate illustrations of the lighter side of the Prince Consort's nature. The work would have been still more complete if Sir Theodore Martin had been enabled by circumstances to preserve some record of the gaiety and humour which occasionally relieved the serious tenour of the Prince's grave and laborious life. It is for the most part neither in official intercourse nor in family life that a genial nature relaxes into hearty merriment; yet there were times when the Prince Consort told and enjoyed good stories, of which some are still remembered. The wise statesman, the blameless father of a family, the model of public and private virtue, might command among men of the world only imperfect sympathy, if it were not known that he was capable of genuine laughter.

DIXON'S ROYAL WINDSOR.*

IN a few simple and pathetic words of preface Miss Dixon tells us how the last evening of her father's life was spent in completing the revision of the third volume of *Royal Windsor*. "What could be done by another hand," she adds, "has been done; but if any errors have crept into the text of the fourth volume, the blame rests with me." It is only justice to say that Miss Dixon appears to have been perfectly competent to carry on the revision thus bequeathed to her, and that the fourth volume shows no signs of the absence of the author's hand.

Much that may be said during a writer's lifetime would be out of place and out of taste immediately after his death. We have not, it is well known, ever been among the admirers of Mr. Hepworth Dixon's style and method as an historian. Without offence, we may say that he belonged to a class of writers who are more attractive to the "general reader" of the circulating libraries than to sober students of history. Further than this we need not now go in criticism. But even if we were disposed to be critical, we should acknowledge that from our point of view these two volumes do show some advance upon their predecessors which we noticed about this time last year. On the whole, the author has less frequently strayed from the beaten track of plain prose; the colouring of his descriptions has been a little toned down, the glitter a little subdued. We could not, even now, term the style austere and chastened, but we may admit that its distressing brilliancy is less obtrusive than of old. We must too in fairness add that, however much there may be in Mr. Dixon's writings which only readers of uncultivated taste could admire, he had the merit of feeling a genuine interest in and sympathy for the men and women of the past, and did not descend to that contemptuous method, which popular writers so often affect, of treating our ancestors as a set of mere knaves and fools.

The third volume opens with Henry VII. riding into Windsor on Saturday, March 29th, 1488, to make his preparations for keeping the feast of St. George in St. George's Hall. Saturday, as Mr. Dixon, following Bacon's *Life and Reign of King Henry VII.*, tells us, was Henry's lucky day—"on a Saturday he had won the battle of Bosworth Field; and on a Saturday he had entered London and secured his crown." To St. George Henry, as befitted one who aspired to the throne of England, professed an especial devotion. "Never for a moment had he failed his patron." We are not sure that this is quite the orthodox and reverential way of expressing a man's relations to his patron saint. It is he who needs his patron's help, not his patron his. Henry, it would seem, had been a dutiful and assiduous votary, and the Saint had never turned a deaf ear to his prayers. This beginning supplies the author with an opportunity for sketching the past history of Henry and his family, and for describing the events which constrained the King to let two successive anniversaries of the Saint pass uncelebrated at Windsor. Queen Elizabeth of York, the "Lady Bessy" of ballad, is set before us in the most approved novelist's manner:—

> Bright, supple, fair, with sea-blue eyes and tawny locks, she looked the model of such angels as Italian masters then loved to paint. Youth, fortune, love attended on her steps; yet few princesses of her race had passed through so much tempest as Elizabeth of York.

It is sad to think of "tawny locks," which would be so valuable to a modern heroine, having been wasted upon a rigid age which forbade even the youngest and fairest matron to display more than one poor tuft of hair between the headdress and that white expanse of forehead, rounded and polished like an egg, which seems to have been the chief "point" of a fifteenth-century beauty. However powerful may have been the charm of Lady Bessy's tawny locks and sea-blue eyes, the assertion that Henry of Richmond invaded England "more to deliver her from bondage than to win a crown" strikes us as savouring rather of romance than of history. We are favoured with a description of his eyes also:—

> Kate seemed to have come back to earth in him. Her eyes were his; two restless and mercurial orbs; not sea-blue, like the other princes of his house, but dark and mystical, with the glamour of a Celtic race.

"Kate," be it explained, is Richmond's grandmother, Katharine of France. Whether an historian is entitled to take the liberty of styling her "Kate" because her first husband, King Henry V., used to do so, is a point on which we have our doubts. Of Richmond's mother, the Lady Margaret, we read:—

> The king's mother, Margaret of Richmond, had no youth, no beauty, to engage the eye. Her wan and troubled face rested on a bent and broken frame. Picture and victim of the civil war, she looked, like many other wrecks around her, wasted in the fire and withered by the storm.

* *Royal Windsor.* By William Hepworth Dixon. Vols. III. and IV. London: Hurst & Blackett. 1880.

Somerset, her father, plucked that red rose in the Temple garden, with his cry:

> "Let him that is no coward and no flatterer,
> But dare maintain the party of the truth,
> Pluck a red rose with me."

Somerset stood against Plantagenet, each in his own person representing a branch of the royal house. No one suffered more in that "contention" than Lady Margaret. The duke, her father, perished in the cause. The second duke, her uncle, fell at St. Albans; and his son, her cousin Henry, lost his life.

The Lady Margaret's father, John Beaufort, Duke of Somerset, though he was, as the head of the Beaufort family, the natural rival of Richard Plantagenet, and though the dramatist represents him as plucking the red rose in the Temple Gardens, can hardly be said to have "perished in the cause," as he died in 1444, some years before the rivalry of the Roses ripened into civil war. He is mainly remarkable for having conducted a feeble campaign in France, and for the suspicion of suicide which attached to his death.

The author goes on to tell of the efforts of "Lovel our dog" and John de la Pole to cast Henry down from his new-won throne. In two successive years Lovel figured as an insurgent leader. As the writer puts it, in speaking of the second attempt, "Returning to his bark and snap, Lovel appeared once more in a rebel camp." The second chapter gives an account of the additions to Windsor Castle planned, and to some extent carried out, by Henry. We are told how he first designed to erect his chapel—"a mausoleum for his dynasty"—at Windsor, but afterwards chose another site. "What Windsor lost Westminster was to gain." Under present circumstances, Westminster's gain seems likely to have its drawbacks. Had the "mausoleum" been erected at Windsor, a place of courtly, not of national, associations, statues to foreign pretenders might be set up in it by those who have a mind, without making the nation an accomplice in an affront to a friendly Government and people.

The chapter headed "A Windsor Comedy" has not, as might be rashly supposed, anything to do with Sir John Falstaff or the Merry Wives, but begins an account, amusing enough, of the process by which Henry half cajoled, half coerced Philip of Austria, who had been cast by tempest on the English shores, into giving up the refugee Edmund de la Pole. "A fat young person, restless, timid, and scant of breath," is the unflattering description, worthy of Mr. Carlyle's pen, which is here given of Philip the Handsome. Philip's perturbations are recounted in a lively and decidedly rhythmical manner. "He knew his host. Unless he fled, Henry was certain to insist on having Pole, and heaven know what besides. . . The roads were long, the English riders fleet." The author shows a dramatist's or a novelist's insight into Philip's secret thoughts:—

> Still, as he sat alone, the query came to him, whether all these courtesies might not mask some sinister design? By similar courtesies, his father, Maximilian, had laid hands on Edmund de la Pole; by similar courtesies, his wife's father, Fernando, had entrapped Cesare Borgia. Such things were of the day. Was Henry of higher chivalry than Cæsar and the king of Aragon? Don Philip fancied not. Like other kings, he had been known to smile, and murder while he smiled. . . What evil scheme, then, lurked beneath those Tudor smiles? Philip was vain, but not so vain as to imagine, that an old man could have fallen in love, like a flower-girl, with his rosy cheek. He drank more wine.

At this point we may leave Don Philip, "flustered by his wine, and fretted by his fears." We pass to the reign of Henry VIII., and to "that mystery of mysteries, called the Duke of Buckingham's plot," as to which the author corrects various errors of Shakspeare, who "mistook the man, misplaced the scene, misrepresented the event." For Buckingham the author has little pity; but all his sympathies go with a later traitor or victim, the Earl of Surrey, whom he paints in the most glowing colours as a cavalier, a poet, "a liberal, opposed in heart and mind to what he called the Old Superstition," and well-nigh as a saint. "He led a life so pure that he was deemed austere." Eating flesh in Lent, and calling notorious sinners to repentance by breaking their windows at dead of night, seem to have been among the developments of Surrey's religious zeal. For this last performance he may, as he averred, and as his panegyrist believes, have had the highest motives; but it must be admitted to bear a suspicious family likeness to the freaks of other young gentlemen of quality who never incurred the reproach of austerity. Edward Seymour, "one of the hangers-on at court, known by his sour visage, and his luck at cards"—the future Duke of Somerset—plays the villain in the drama of which Surrey is the good hero. That Surrey owed his death to the hostile influence of Seymour has long been an accepted belief. At an earlier stage of his career, Seymour, according to Mr. Dixon, helped to destroy Surrey's cousin, Queen Anne Boleyn, in order to "lift his sister Jane, a middle-aged coquette, into her majesty's seat." A dark hint is thrown out that Seymour may have had some hand in the death of Surrey's playmate, friend, and brother-in-law, Henry Fitzroy, Duke of Richmond, whom, it was suspected, the King, in default of a legitimate son, had once intended to make his heir:—

> Seymour detested him [Richmond], for both his own sake and his wife's sake. Each was a rival of his sister Jane. By what means—foul or fair—he passed away, no man can say. Like to the beginning was the end of that strange life. Out of the shadows he had come, into the shadows he fell back.

Not that in these pages Henry Fitzroy's origin is left in the shadows. On the contrary, a pretty strong light is turned upon the subject, and the fact that his birthplace was a house called "Jericho," which Henry VIII. greatly frequented, gives occasion for a distressing joke about "gone to Jericho." But there is much, derived from Surrey himself, about the early life of Richmond and his friend at Windsor which is pleasant reading enough, despite the overstrained style; and those unacquainted with our early poets may obtain from the specimens here given, and the remarks upon them, a good idea of Surrey's musical verse. We wish the author had less frequently transferred to his own prose the "lilt" which he so praises in the Earl's poetry. A chapter is given to Fair Geraldine, with whom, so it is asserted, Surrey "was not in love . . . . . except so far as Shakspere may be said to have been in love with Portia, Viola, and Imogen." This illustration is not very apposite, as at any rate Geraldine actually existed, and was not a pure creation of the poet's fancy.

The chapter headed "Lady Elizabeth's Grace" will hardly meet with the approbation of M. Wiesener, who has laboured so hard to demolish the "legend" of the persecution of Elizabeth by her cruel half-sister. Bedingfield, Elizabeth's custodian, who in truth appears to have been a "gaoler" much of the type of Sir Hudson Lowe, is here described as "a brute, who seemed unconscious of the lady's rank, and even of her sex," and the men under his command as "a gang of rake-hells gathered from the city slums." Of Queen Mary we have a personal description, which, even if not exaggerated as to facts, is too painful for good taste. Some decorous reticence, some decent charity towards physical defects and infirmities, should be observed even in writing of "old maids of thirty-nine." By way of dealing out even-handed justice to both sides, Philip of Spain is treated in much the same style of unpleasant exaggeration:—

> The "good" young man turned out a cheat. Instead of looking handsome and heroic, like his portraits, he was a dwarf; with crooked legs, a narrow chest, a hanging lip, a gaping mouth, and a protruding jaw.

We are told that from the time of his landing to that of his coming to Windsor, "no drop of English wine had passed Don Philip's throat, nor had the Spanish shirt of mail been taken off," so fearful was he of poison or assassination. The statement about the wine may be literally true; but both Lingard and Mr. Froude agree—and it is not often that they do agree—that on his first reception in England Philip pledged the company in a tankard of English ale, in order to show his readiness to adapt himself to the customs of the country. Before leaving this volume, we will note a misprint in the chapter on Ascham's *Schoolmaster*—that of "Turnor" for Tusser, whose lamentable, though not very poetical, lines, setting forth how he once received "fifty-three stripes" from Udall, the master of Eton, are here quoted.

On the last volume our limits will not permit us to comment at any length. The most interesting passages are those upon James and Charles I.'s enforcement of their forest rights at Windsor, and upon the rebuilding of Windsor Cross by Bishop Goodman. The history of the Castle is brought down to the close of the reign of George III., and thence—George IV. and his connexion with Windsor being ignored altogether—to our present Sovereign:—

> A third scene—and the last—shows the fortress of Edward, the court of Elizabeth, the camp of Cromwell, the head-quarters of William, changed into the picture of an English home.

MEMOIR OF BISHOP MILMAN.*

WITH all the loving care bestowed upon this book, there is one point where it is deficient. Those who knew Robert Milman, whether in England or in India, whether as priest or bishop, know that he was not only a very saintly character and a man of highly original mind, but that there was in him a depth of grim humour which no amount of anxiety could exhaust, and that he was constantly saying, without effort or premeditation, good things which made one think as well as laugh. Of this humour, so much a part of the very nature of the man himself, there is scarcely a spark in the four hundred pages before us. It is also a subject of regret to us that her estimate of his episcopal work has induced his biographer to devote only some six or seven pages to the first fifty years of his life; although Miss Milman can quote from an "Indian civilian high in office, a Presbyterian by birth, creed, and education," the assertion that Bishop Milman "made such a mark as no man had ever made in India before." We think that old Indians who watched how Milman's predecessor, in times far more critical, while the flames of the Mutiny were still smouldering, went about his work, will be slow to admit that any Indian ecclesiastic, however eminent, has ever surpassed Bishop Cotton, the great statesman prelate who disarmed suspicion and silenced opposition, and at the same time was ever learning and modifying his theories as experience guided him. But this is rather anticipating matters; and we must repeat our regret that more is not told us of the earlier life of Milman than that, having been presented by the care of his uncle, the Dean of St. Paul's, who was then Canon of Westminster, to the living of Chaddleworth in Berkshire, almost immediately on his ordination to the priesthood, he became successively Vicar of Lambourne and of Marlow, reducing his income and adding to his labours at each exchange, and everywhere setting a very high example of parochial work. There are many more good stories about him still afloat than

* *Memoir of the Right Rev. Robert Milman, D.D., Lord Bishop of Calcutta and Metropolitan of India; with a Selection from his Correspondence and Journals.* By his Sister, Frances Maria Milman. London: John Murray. 1879.

the solitary one given in this book, which tells us how, when a Lambourne horse achieved some unusual triumph, and the ringers, horsey every one of them, defied the Vicar and got into the belfry and celebrated the victory by a merry peal of the church bells, the Vicar summoned them before the magistrates for an act of trespass, and on the following Sunday preached a sermon on the abuses of the turf which made his hearers tremble. A day's ramble on the Berkshire downs, with judicious inquiries made of the natives, would even at this distance of time bring to light a multitude of stories of the Vicar of Lambourne which would show what manner of man he was. We ourselves have a good store of them. Amidst unceasing parochial activity Mr. Milman was an intense student. He was eminently what is called an "uncomfortable" man; he had no sense of personal comfort or ease; it was not asceticism, but sheer indifference, which shaped his life and made him reckless of health, regardless of food, whether as to its quality or the regularity with which it was served, which sent him to bed almost at the hour when the rest of the world was thinking of rising, and made him content with four or five hours of rest. His studies were not unproductive. Several works of his will long survive him. The Life of Tasso which he published in 1850 testifies to the elegance of his Italian scholarship; while at Lambourne he published the *Conversion of Pomerania*, now a text-book in the Oxford schools; and his devotional Exposition of Isaiah, chapter liii., *The Love of the Atonement*, published about the same time, at once took that foremost place among devotional books which it is not likely to lose. It was another instance of the keen discernment of the late Bishop Wilberforce that he asked the Vicar of Lambourne to leave the Berkshire downs and a purely agricultural flock and take charge of the more important parish of Great Marlow. The Bishop was wont to say that Milman's was the most original mind in the diocese; it was well stored with patristic reading, and his sermons at Oxford and his lectures at Cuddesdon delighted as much as they astonished his hearers.

In January 1867, when he had nearly completed his fifty-first year, Milman was offered the see of Calcutta by the present [Lord] Salisbury. He was by no means the first person to whom [the] offer had been made. There are at least two bishops now on [t]he Bench who, with other very eminent men, shrank from the responsibility; but Milman regarded the offer as a call, and when told that the see had been vacant three months and that he had better not delay his departure to the autumn, he replied with military promptitude that he would be ready in a fortnight. Consecrated on the Feast of the Purification, he left his old home on February 14, and on Lady Day was enthroned in the cathedral at Calcutta.

The difficulties of an Indian bishop can hardly be realized save by those who have special knowledge of them. Indian bishops are, to a degree which has no counterpart elsewhere, officers of State, and bound by regulations which seem at times to subordinate their spiritual to their official functions. They exist, as no other bishops exist, under the provisions of an Act of Parliament—the 53rd George III.—which could not contemplate the present condition of India either ecclesiastical or social. When Wilberforce and his friends succeeded in getting passed the Act of 1814, under which Bishop Middleton was consecrated and sent to Hindostan, they aimed only, as the Act declares, at "the superintendence and good government of the Ministers of the Church Establishment within the East Indies." There was not a single clergyman in India except the chaplains of the East India Company, and there was no appreciable English population except the servants of the Company. The only missionaries whom English money supported were in Lutheran orders, and it was not likely that the Company, then in the plenitude of its power, would encourage missionaries, when it had but recently expelled the Serampore brethren from the territory of which it was the ruler. But now, although the Establishment remains, and a hundred and sixty chaplains are maintained out of the resources of the country, there has grown up a clerical body, composed of divers elements, which altogether outnumbers the chaplains, who are not unfrequently given to calling themselves "the Indian Church." Our Indian possessions are no longer a huge garrison. As railways have been developed, and tea-planting and other industries have attracted immigrants from this country, it has been found necessary to provide the ministrations of religion for this civilian population, who have no claim on the services of the chaplains; and between thirty and forty clergymen are thus employed. Within the last fifty years missionary work has covered nearly the whole of India with a network of evangelistic agencies, and the missionary clergy now number nearly three hundred, of whom more than one-third are natives of the land and the indigenous clergy of the true Indian Church. Over this complex clerical body, consisting of Government chaplains, English pastors, English missionaries, and native clergy, the Bishops of India preside; and to direct workers so differently conditioned and work so diversified is a Herculean and even impossible task. They are hampered, too, in a way which other bishops know nothing of; the Letters Patent granted in 1814 curtailed the full episcopal powers, and intimated in so uncertain tone that these limited powers were liable to further curtailment at the Royal pleasure. The later Acts which constituted the sees of Madras and Bombay repeated the tone of the earlier Act. As our Indian Empire has grown, the sees have, by a legal fiction, been supposed to extend in corresponding measure; and, in spite of the immense change which has altered the whole work of the Church, and has introduced four distinct groups of clergy where originally there was only one, the original conception of Indian bishops, which made them quasi-chaplains-general in episcopal orders, still remains in full and unassailed force. The sees of Lahore and Rangoon were only allowed by the authorities to be founded by private munificence two years ago, when the death of Bishop Milman from overwork proved the necessity of such relief, on condition that the new bishops received, in addition to the endowments of their sees, the position and emoluments of Government chaplains, and therewith the subordination to the civil authorities. Even this might have been impossible but for the discovery that the Act of 1814 in strictness only extended to what was at that time British India. Moreover, the terms of the Royal Proclamation of 1858, in which all persons under the authority of the Crown are strictly enjoined "that they abstain from all interference with the religious belief or worship" of any of their fellow-subjects in India, do undoubtedly limit the episcopal functions to the oversight of the Government chaplains. No bishop in India, so far as we know, has ever acted on the letter or the spirit either of the Letters Patent or of the Royal Proclamation of 1858. Middleton, Heber, Cotton, Douglas, and Milman have been strenuous evangelists; and, as there have been no missionary successes on a scale to provoke an outbreak of Hindoo or Mussulman fanaticism, they have not been interfered with in their missionary work. But they have all done what they have done with strength overtasked and with minds distracted by many duties; and with an episcopate so constituted and so limited the unification of the Indian clergy is impossible. Bishop Milman wrote, in spite of these documents:—"We Indian bishops were especially appointed from the first with distinctly missionary objects; to be mere head military chaplain is not a position which would have much attraction." Feeling this intensely himself, he called upon the chaplains at least to show sympathy with missionary work, adding:—"You are, before Christ, as responsible for the heathen round you as you are for the British soldier. There is no evading this accountability by any one who undertakes an Indian chaplaincy. I felt it in my own person even terribly when I accepted the bishopric, most reluctantly, God is my witness." Nevertheless, the man who, situated as Milman was, wrote these words, was obviously in a false position.

How he endeavoured to prepare himself for this arduous work is very generally known, and is amply brought out in his biography. That a man should have acquired after his fiftieth birthday a knowledge of Arabic, Persian, Hindustani, and Bengali, a power of ministering easily and with comfort to himself in the two last-named tongues, and the extraordinary facility of speaking—as on one occasion he spoke to educated Hindoos for an hour and a half, without a single note—in idiomatic Hindustani, using, as his subject compelled him to use, many scientific and theological terms, is a feat almost unparalleled. His addresses in English on subjects which were not remotely connected with Christianity were eagerly listened to by the natives, who appreciated him "because he always treated them with respect." And yet, although his work was done by almost superhuman effort, it could not be done as it ought to have been. The Bishop's life was a protracted scramble, possible only to a man of iron frame and blessed with perfect indifference to his own comfort. "The diocese has to be gone round once in three years," he wrote, and he managed to accomplish the feat, but only by incessant night travelling, now in dak gharri, now in palki, now in canal boat, now on horseback, and after nine years he sank beneath the burden utterly worn out. Under his guidance a new Furlough Bill was passed which made it possible for bishops to go to England more frequently than before, and at the same time prevented their remaining away from their dioceses and their work too long. There can be no doubt that under Milman's rule the standard of Christian living among the laity, and of ministerial obligation among the clergy, was visibly raised; with no thought of being popular, he had a wonderful gift of winning men's hearts; the palace was described as a "happy hospitable home," whose doors were ever open, and were a true type of the heart of the owner; and it is sad to think that under the burden of labours with which it was impossible to cope, a valuable life has been sacrificed, when with ripened experience it was rapidly accumulating larger and larger results.

WILLOBIE'S AVISA.*

TO approach the private and personal life of Shakspeare is an ambition which human curiosity would do well to resign. By an extraordinary fatality the darkness which conceals the individual career of the great poet covers also all those who are known to have been brought into connexion with him. No sooner do we become aware of some fresh link between him and his contemporaries than the customary disappointment results, and we are bound to confess that the new information leaves us as ill informed as it found us. But perhaps in no instance are we so vexatiously balked, led so close to the verge of a revelation and then thrust back again, as in the case of the curious little book called *Willobie's Avisa* which Dr. Grosart has just reprinted for the first time from a unique perfect exemplar which has only lately come to hand. Towards the close of the next century Sir Aston Cokain left on

* *Willobie his Avisa; or, the True Picture of a Modest Maid and of a Chaste and Constant Wife.* 1594. Reprinted for Sixty Subscribers by the Rev. A. B. Grosart. Blackburn: 1880.

record that he knew Massinger intimately, and could have written his life had he cared to do so. We feel that we could almost have pardoned him for the infamous comedies that he found time to write if he would have earned our forgiveness by undertaking the task which he disdained so cavalierly. In like manner it is plain that the anonymous poet of *Avisa* might have secured immortality had he resigned the delight of writing mediocre verses, and had told us, in plain prose, all that he knew about Shakspeare.

That he did know not a little seems tantalizingly certain. In the prefatory verses attached to *Willobie's Avisa* we find the earliest mention of Shakspeare's name that has hitherto come to light:—

> Though Collatine have dearly bought,
>   To high renown, a lasting life,
> And found, that most in vain have sought,
>   To have a fair and constant wife,
> Yet Tarquin plucked his glistering grape,
> And Shake-speare paints poor Lucrece' rape.

Before, however, we dwell on those passages in the body of the poem which seem to refer to the great poet, we may describe the general tenor of the work itself. It opens with a description, in high-flown terms, of a certain Avisa, a young maiden of lowly origin, not sprung "from eagles' nest, but turtle-bred," of the most delicate beauty, and constant, both as a maiden and a wife, against the attacks of many lovers of high degree. That this Avisa is a real person becomes obvious from many little realistic touches, which the author does not hesitate to give—among others, that she is the daughter of the mayor of a neighbouring town. She was born

> At wester side of Albion's isle,
> Where Austin pitched his monkish tent;

that is, it would seem, at Glastonbury, in Somersetshire; but she lives in a "rosy vale" at some distance from her birthplace, and close to an ancient castle. It appears that even before her marriage she is the hostess of a village inn, and hither comes a nobleman—but whether the occupant of the castle or not is not stated—to make trial of her virtue. The nobleman offers her the pomp and station of a lady, but will not offer marriage, and his entreaties and her refusals are given in dramatic form, at great length. At last he rides off in a passion, vowing to be revenged upon her, and she presently marries some one in her own position, whom she seems to bring to share the tavern with her; for she still serves travellers with liquor, under the sign of "St. George and the Dragon." A soldier comes and makes hot love to her, and in the same dramatic form his pleadings and her rejection are recorded. The soldier is at last got rid of, and then "a close and wary suitor, D. B., a Frenchman," lays siege to her heart with letters, jewels, rings, and a "long-continued course of courtesy," but in vain. To him succeeds a still more mysterious and persuasive "Dydimus Harco, Anglo-Germanus," who pleads without success for some time, and then gives place to the reputed author of the poem, Henry Willobie. It is during his suit that those allusions occur which have very plausibly been supposed to refer to Shakspeare. The whole passage is so curious that we quote it entire:—

> H. W. being suddenly affected with the contagion of a fantastical fit, at the first sight of A[visa], pineth awhile in secret grief, at length not being able any longer to endure the burning heat of so fervent a humour, bewrayeth the secresy of his disease unto his familiar friend W. S., who not long before had tried the courtesy of the like passion, and was now newly recovered of the like infection; yet, finding his friend let blood in the same vein, he took pleasure for a time to see him bleed, and instead of stopping the issue, he enlargeth the wound with the sharp razor of a willing conceit, persuading him that he thought it a matter very easy to be compassed, and, no doubt, with pain, diligence, and some cost, in time to be obtained. Thus this miserable comforter comforting his friend with an impossibility, either that for now he would secretly laugh at his friend's folly, that had given occasion not long before unto others to laugh at his own, or because he would see whether another could play his part better than himself, and in viewing afar off the course of this loving comedy, he determined to see whether it would sort to a happier end for this new actor than it did for the old player. But at length this comedy was like to have grown to a tragedy, by the weak and feeble state that H. W. was brought unto by a desperate view of an impossibility of obtaining his purpose, till time and necessity, being his best physicians, brought him a plaster, if not to heal, yet in part to ease his malady. In all which discourse, is lively represented the unduly rage of unbridled fancy, having the reins to rove at liberty, with the divers and sundry changes of affections and temptations, which Will, let loose from Reason, can devise.

All this, if it means anything at all, seems to mean that Henry Willobie, about whose identity we shall presently have something to say, falling in love with Avisa, the fair and chaste hostess of the "St. George and Dragon," and prosecuting his suit without success, bethought him of his friend William Shakspeare, whose general practice of love-poetry, and specially his late inditing of the *Sonnets*, had pointed him out as a man unusually gifted in reading the secrets of the heart; but that Shakspeare, not being inclined to interest himself seriously in Willobie's success, took a pleasure in teasing him, and leading him on with inflammatory counsel. We may note that the peculiar wording of the passage denotes, not only that W. S. was prominent as a love-poet; but that he was connected, probably as an actor, with the stage. We return to the poem, and we find that for the next few pages the two interlocutors are W. S. and H. W., W. S. encouraging the lover to persist in his suit, and remarking—

> She is no saint, she is no nun.
> I think in time she may be won.

Five years later, in that spurious collection of verses by various hands called the *Passionate Pilgrim*, there were attributed to Shakspeare certain stanzas commencing—

> When as thine eye hath chose the dame,
> And stalled the deer that thou shouldst strike,

which have so extraordinary an identity, both in metre, tone, and style, with those given to W. S. in *Avisa*, that the parallel struck the first critics into whose hands the latter poem fell. Unfortunately this interesting fact scarcely helps us. If the *Passionate Pilgrim*, or if these particular verses, could be by any canon of criticism considered Shakspeare's, we should be able to secure a link of personality. But unfortunately that volume was a nefarious speculation, very little of which, and certainly not these special stanzas, can be supposed to come from the pen of Shakspeare. One thing, however, seems certain, and that is that they are by the same hand that wrote the praises of Avisa, and the fact that in 1599 Willobie's verses could be attributed to Shakspeare tends to confirm the supposition that his friend W. S., in 1594, was Shakspeare.

But who was the author of *Avisa*? This also is an extremely obscure and complicated question. The Henry Willoughby or Willobie, upon whom it is fathered by an editor who signs himself Hadrian Dorrell, has been identified by Dr. Grosart with a certain youth of that name who was sixteen years of age when he matriculated, in 1591, at the College of St. John's, Oxford. In the prose preface to *Avisa* Hadrian Dorrell pretends that his young friend Willobie has started on the Queen's service to the Continent, and has given him leave to search in his study, where, among his papers, Dorrell has found this poem, which he gives to the world. If we only possessed this first edition of *Avisa*, there would be no reason for doubting this statement; but, when it came to be reprinted in 1596, some very extraordinary additional information was forthcoming. It seems that the poem gave great scandal, and especially to the family of Sir Ralph Horsey; so far, indeed, that a poetaster of the name of Peter Colse came forward with a pamphlet attacking the author of *Avisa*, and accusing him of libellous indiscretion. To this attack Dorrell replied in the preface of his 1596 edition; but, forgetting that he had described Willobie as a young man, he now declared, no doubt in order to assert a literary alibi, that the poem had been written at least five-and-thirty years before. This would refer it to 1560; and, so rapid had been the progress of our literature that we may feel almost certain that this smooth and modern production could not have been composed in an age of which *Tottel's Miscellanies* marked the extreme limit of accomplishment. Hadrian Dorrell being thus caught in the plain act of lying, and being further discovered asserting in the strongest language that Avisa was not an existent person at all, but only a type or figure of chastity—as though any poet would represent such an ideal as serving drink to wayfarers from behind the bar of a country inn—we begin gravely to doubt his first as well as his second story, and to guess that the name of Henry Willobie was from the beginning brought in to veil the real authorship. That he really existed as a person, not as a poet, seems to be certain, as well as that in 1596 he was dead. But the opaque mystery that shrouds the whole story of this curious book falls equally on the person of Hadrian Dorrell himself. No such contemporary name is known, and to us it seems probable that this was a pseudonym used by the author alike of preface and poem, and we would suggest that the initials may be connected with the D. H., Dydimus Harco, who is represented in the poem as having immediately preceded Henry Willobie in the courtship of Avisa.

Altogether, it must be confessed that the republication of this poem of *Willobie's Avisa*, to which Shakspearian students have looked forward with so much expectation, and which it was hoped would throw light on that mystery of the *Sonnets* about which the critics are always fidgeting, has resulted in nothing but disappointment and ungratified curiosity. Even Mr. Swinburne, who hailed the announcement with a characteristic outburst of "gratitude for the one inestimable boon long hoped for against hoping," must allow that he has to be thankful for very small mercies. At last a perfect copy of the much-discussed *Avisa* has been discovered; at last it has been very carefully and exhaustively edited by one of the most learned of our Elizabethan critics, with the careful collation of all collateral and illustrative literature; and the result is that some one, we know not who, being in love with the hostess of a country tavern, appealed to Shakspeare for assistance in prosecuting his suit, and that Shakspeare teased and bantered him in humorous malice. This is interesting, and the record of it is valuable; but it brings us so near to the person of the great poet, and at the same time reveals to us so extremely little of his nature, that we are almost like the boy in Mr. Sala's novel who was so much hurt by the pennies which the lady threw in his face that he forbore to thank her. We desire, as in duty bound, to thank Dr. Grosart; but we can scarcely be expected to forgive the author of *Willobie's Avisa*.

THE CHURCH UNDER QUEEN ELIZABETH.*

"BEATI Pacifici" is the curiously inappropriate motto which Dr. Lee has prefixed to his ferocious onslaught upon Queen Elizabeth, her statesmen, and the prelates who ruled the Anglican Church during her reign. His notion of a *pacificus* would be applauded by the most pugnacious Irishman at Donnybrook Fair. He attempts to make peace in the Church by knocking down every Christian who disagrees with him. Such an ideal of pacification accords better with the Old Testament than with the New; and we

* *The Church under Queen Elizabeth: an Historical Sketch.* By the Rev. F. G. Lee, D.D., Vicar of all Saints, Lambeth. 2 vols. W. H. Allen. 1880.

only wonder that a writer so fond of filling up vacant spaces with mottoes and texts did not go on to interpret Scripture by Scripture, after the fashion of the "Commentary purely Biblical," by adding the Psalmist's exclamation, "Blessed be the Lord my strength, who teacheth my hands to war and my fingers to fight." His long "introduction" in the first volume is a great deal more interesting than his book itself. *The Church under Queen Elizabeth* contains nothing new, though the author plainly imagines that it will nearly all be new to the very curious class of readers for whose illumination he has been moved to study what he considers to be the true sources of Elizabethan Church history. These sources are Morris's *Troubles of our Catholic Forefathers*, Foley's *Records of the English Province*, the *Douay Diary*, Jessop's *One Generation of a Norfolk House*, and "the profound treatise by Harpsfield, Archdeacon of Canterbury, on 'The Pretended Divorce of Henry VIII.,'" of which the author made plentiful use in his previous *Historical Sketches of the Reformation*. Dr. Lee has supplemented these infallible authorities, as he evidently regards them, with occasional glances at the less trustworthy evidence supplied by some of the publications of the Parker Society, the Calendars of State Papers, Strype, Miss Strickland, and a number of ephemeral pamphlets. The latter are mostly cited to substantiate some damaging allusion to the morals of the Queen and the English Bishops, or some one-sided representation of the terrible condition of the Church. Our peacemaker gives the name "Corporate Reunion" to the object on whose behalf he lays about him with his literary tomahawk. It is the loss of "corporate union," after the accession of Elizabeth, which throws him into so violent a passion with the Queen, with Cecil, and with the reforming party—except perhaps with his predecessors in Nonconformity. We scarcely suppose that Dr. Lee will be offended with us when we call him a successor of the Elizabethan Nonconformists. He agrees with them in substance; he differs only in accidents. We cannot call him a Papist, for he still holds a beneficed cure under the jurisdiction of the successor of Cranmer. As the Elizabethan Nonconformists wished to Calvinize or Zwinglianize the National Church whilst they held fast to its clerical offices, so our Victorian Nonconformist wishes to Romanize it—in a sense undreamed of by the Ritualists who are the butt of his satire—without renouncing his vicarage. That the complete Romanizing of the English Church is that which Dr. Lee himself really means by "Corporate Reunion," whatever it may mean with others, is stated as openly as possible over and over again in his introduction and in his history. "England," he says, "was duped into practically repudiating her relations with the Universal Christian kingdom, its laws, and its ruler. Cranmer first betrayed the local flock which he was to govern, and so made a similar work easier for those who came after him, Matthew Parker and his immediate allies." The Church of England, in which the author holds office as a beneficed and licensed priest, is described by him, with all the emphasis of capital letters, as "The New Church, finally arranged, formed, and moulded under Queen Elizabeth," as "a purely local and national body, neither more nor less." As some of the early Puritan Nonconformists, groaning under their grievous sense of the insufficiency of their Anglican ordination by the hands of bishops, quieted their consciences by obtaining a supplementary and purely Presbyterian ordination from Geneva, and were thus enabled to hold livings and exercise their ministry with self-satisfaction, in like manner Dr. Lee and others, if we rightly understand his appendix on the Order of Corporate Reunion, have obtained "actual power of jurisdiction" and "certain integrity of all sacraments" from the hands of "the Bishop of Dorchester, the Bishop of Selby, and the Bishop of Caerleon"—prelates residing and officiating nobody knows where. Although the Pope may not acknowledge these prelates, it is evident that they acknowledge him, for the end of all their labours, as of Dr. Lee's historical sketching, is "Restored peace and Visible Unity, under the paternal rule of the Primate of Christendom."

We need hardly say that Dr. Lee can see nothing but wholesale destruction and deformation in the Church work of Elizabeth and her bishops. He is even incapable of perceiving, or at least of granting, that this was not the aspect in which their work was regarded by themselves. He frequently drags forward Bishop Pilkington of Durham as the type of a deformer, and even uses that treasury of pure English and masculine teaching, the Bishop's Exposition upon Aggeus and Abdias, as an arsenal of missiles for hurling at the prelate himself. A student with the least germ of critical faculty would have asked why a great preacher early in Elizabeth's reign should have selected the prophecies of Haggai and Obadiah as fit subjects for a long series of popular expository sermons. The text which Pilkington placed on his title-page might have given Dr. Lee a hint why he applied the prophecies of the age in which the Jewish Temple was rebuilding to the needs of English churchgoers in the age of Elizabeth. "The earnest love that I beare to Thy House hath eaten Me: Psal. lxix. Joan ii."—this is the text with which Pilkington began his exposition of Haggai. "Except the Lord build the House, they labour in vaine that build it" is the text prefixed to his exposition of Nehemiah. He believed that the Queen, the Parliament, the bishops, and the christened people of England were divinely called to a work of building rather than pulling down, construction rather than destruction, reformation and not deformation. "The chief interest of his (Haggai's) prophecy," says Pilkington, "is to stir all to the speedy building of God's House, which they had so long neglected." It is worth observing that the Bishop's ideal rulers, next to the reforming and rebuilding kings of the Old Testament, are "Constantinus Magnus, Justinianus, Theodosius, Carolus Magnus, and Ludovicus Pius." He is eager that "our mild Ester," as he calls Elizabeth, should follow their example "in their zeal and earnest love to build God's House"; and he prays that "the Lord, for His crucified Christ's sake, which came down from the bosom of His Father to teach us to build Him a House here," would grant all the English folk, "in all degrees, from the highest to the lowest, an earnest simple love to the true building of His House." Bishop Pilkington may have been a destroyer, and Dr. F. G. Lee may be a constructor; but it is scarcely fair in the latter to hide the substantially constructive intention and character of the Bishop's sermons, which are only second to Latimer's in their fearless impartiality, their glimpses of contemporary social life, and the purity and vigour of their English. If he had inspected the letters and writings of the English Reformers a little less superficially, he could not have failed to be struck with one common characteristic which runs through them all—namely, that in casting out of the National Church those things which Dr. Lee seems to regard as the supreme signs of Catholicity, if not even of Christianity, they sincerely believed that they were fighting against Mammon as well as against the foreign usurpation of the Roman Bishop. Pardons, purgatory, memorial masses, trentals, "diriges," are never mentioned by Bishop Pilkington in his sermons without a reference to the money which the Pope or the Popish priest gained by them. Gross secularity and love of money are the charges which he most often brings against his typical "Sir John Lacklatin" and "Sir John Mumblemattins." It may be possible that he knew his own contemporaries less exactly than Dr. Lee knows them; but it ought to be remembered that his words were addressed to a generation which knew Sir John Lacklatin face to face, and could verify the truth or falsehood of Pilkington's charges. "The ministers of Christ's kingdom," says Pilkington, "have power spiritual to loose and bind; Receive ye the Holy Ghost; whose sins you forgive, they are forgiven; but not when Sir John Lacklatin for money lay his hand on his head." The complaints which the Elizabethan prelates made against the spiritual inefficiency or the immorality of the "popishly affected" clergy are either ignored by Dr. Lee, or else are inverted into proofs of the contrary. Archbishop Grindal told Cecil that the Bishop of Carlisle had no help in his cathedral because "all his prebendaries are ignorant priests or old unlearned monks." "If there be a trental to be said," asks Pilkington, "or any money to be gotten for masses, diriges, relics, pardons, &c., then who is so ready as they? They can smell it out a great sort of miles off. But if a man want comfort in conscience, would understand his duty towards God, or God's goodness towards us; they be blind beasts, ignorant dolts, unlearned asses, and can do nothing but make holy-water, and bid them say a Lady's Psalter." It is a gain to the true knowledge of the age to have all that mass of evidence brought forward which Dr. Lee cites with such pleasure from Roman Catholic contemporaries of Elizabeth. But it does not disprove the evidence on the contrary side; it has to be balanced against it. The final witness of history, when it is fairly put before the student with some completeness, will always make for the vindication and the condemnation of both parties in any great religious or political struggle. He will learn that the one was not so wholly bad as its enemies pretended, the other not so wholly good as its advocates contended.

As the cause of the present incomparable misery of England amongst nations, and of the incomparable degradation of the English Church amongst churches, is traced back by Dr. Lee to Elizabeth's rebellion against "the Primate of Christendom," we are surprised to find so little detail in his book concerning the exact relations between the English Queen and the successive Roman Bishops of her time. During her long reign the Roman chair was held in turn by nine Popes. The reader will scarcely believe that even the name of Paul IV., to whom Elizabeth officially notified her accession, and who demanded that she should submit her claims to his decision, is not to be found in Dr. Lee's index or text. Perhaps he has omitted all mention of this Pope on account of his dislike to Philip II., his persecution of Cardinal Pole, and his employment of wicked German and Lutheran heretics to defend "the Holy City," as Dr. Lee calls Rome, against the holy Roman Catholic and Spanish besiegers under the Duke of Alva. Yet, if we accept Von Ranke's estimate of Paul's policy, this Pope did far more than the English Queen herself to bring about the result which is the cause of all Dr. Lee's sorrow and of his historical sketching. That Papal supremacy which was restored in England by "the Supreme Governess of the Church of England,' Mary, and her husband Philip II.—an event of which Dr. Lee writes with ecstatic effusion—need not have been again so quickly lost. "Paul," says Von Ranke, "had not to acquire the allegiance of England, he had merely to retain it." Dr. Lee gives us two glimpses of Pius IV. First, we see "the members of the Council of Trent wishing him many years and eternal memory." Secondly, we see him writing to Elizabeth "a beautiful and even touching letter." His severe Dominican successor, Pius V., the great "St. Pius" of the Roman Calendar, was a very different Pope, and the contrast between them appeared in their different treatment of the royal English schismatic. While Pius IV. addressed her as "his dear daughter in Christ," and entreated the prodigal child to return to him as her "true father," Pius V. thundered out his famous Bull against her as "Elizabeth,

pretended Queen of England." Dr. Lee of course gives an English version of this document, which is conceived quite in his own style. He revels in the furious rant of its language, and in its tremendous assumption of a worldwide secular as well as spiritual jurisdiction. Pius V. not only affected to "cut off" the English Queen "from the unity of the Body of Christ," but commanded "all and singular the nobles, the people, and others, never to venture to obey her monitions, mandates, and laws," and "released" all English citizens from the Oath of Allegiance. Our historical sketcher actually describes this usurping and extranational call to civil rebellion, this piece of ecclesiastical Cæsarism, as "the paternal action of His Holiness," and he calls attention to the Bull as "weightily spoke, not with the stuttering accents of usurping and pitiful heretics, but with all the due and delegated authority of the First-born of the Most Highest." We can only conclude that if the vicar of All Saints, Lambeth, had lived in the reign of Elizabeth, he would have piously taken part in some plot against his Queen; or that he would, as he says of his hero Felton, have declined, after the decision of the Pope, to acknowledge Elizabeth as his sovereign.

We get no portrait of Gregory XIII. Perhaps Dr. Lee dislikes him, as much as he dares to dislike a Pope, because he "reformed" the Calendar. Urban VI., Gregory XIV., and Innocent IX. share his lot. Our sketcher is of course forced to take some notice of Sixtus V. This Pope, he tells us, sent Philip II. "a blessed banner, and His Holiness's good wishes for the success of the Armada." He devotes a footnote to a curt biography of this high-minded and able pontiff, in which he informs us, after the manner of Miss Mangnall's Questions, "He encouraged the Holy League in France, formed to defend the Faith against the Huguenots, and was active both in maintaining the rights of the Primate of Christendom, and in putting down innovation and error." Baron Hübner has shown us that Sixtus V. was a thoroughly patriotic Roman and Italian as well as the international "Primate of Christendom," and that his encouragement of the League in France and of the Armada against England was by no means so hearty as Dr. Lee imagines, since his sympathy with the predominantly Roman Catholic policy of Spain was conditioned by his terror at the prospect of an almost universal Spanish Empire. Dr. Lee would certainly have praised him less had he known more about him, for he disliked what Dr. Lee most admires, and admired what he most dislikes. Philip II., one of our historian's heroes, put no confidence in Sixtus. Henry IV., while still a Protestant, liked him. But it must be most painful to Dr. Lee to be told that Sixtus V. admired Queen Elizabeth, and was admired by her. When her statesmen were once pressing her to choose a husband, she replied, "I know only of one man who is worthy of my hand, and that man is Sixtus V." It is true that he sent his blessing to Philip II. before the sailing of the Armada; he was glad to think that the flower of Philip's Neapolitan nobility and soldiery should be removed so far away from Italy as England was; but the Pope never paid his promised contribution, contending that it had not been earned, as the Spaniards had never landed upon the English coast. Dr. Lee loosely introduces the name of the last Pope contemporary with Elizabeth, the able and pacific Clement VIII., but in no connection with her. "One of the Primates of Christendom," he tells us, "highly commended his [Richard Hooker's] labours." He learned this from Keble's notes to Hooker. Clement VIII. was scarcely a Pope after Dr. Lee's model. He absolved that politic convert, Henry IV. of France, Elizabeth's friend, to the irritation of her foes and Dr. Lee's friends, the Spaniards. He winked at Henry's Edict of Nantes and the consequent toleration of French Protestantism. What must be even worse in Dr. Lee's opinion, Clement, if we may trust Sully, put some restraint upon the intrigues of the Jesuits in England. When Henry IV. sent Sully to England, immediately after the death of Elizabeth, the French statesman was at the pains to collect particulars as to her relations with the Pope at the close of her reign, especially in regard to the differences between the English Romanist secular clergy and the Jesuits. The Queen even provided those of the secular clergy who were deputed to visit the Pope with a passport signed by the hand of Cecil. She thought, says Sully, that she was bound to defend the seculars, and looked upon the Jesuits as her real enemies. Considering the purpose of his volumes, Dr. Lee might well have substituted some account of this episode for the turgid pages with which he describes the last days and nights of the Queen's life, a description which he must surely have originally purposed for a novel.

If Dr. Lee has succeeded in nothing else, we are bound to say that he has achieved one unique feat. He has compiled the most comical, absurd, slipshod, and useless index ever appended to an English book. Thus, under the letter A, we find "Another controversy arises," and "Another pilgrimage of grace"; while under C or P we find no reference to either. Under G we are referred to "General social disorder," "Great changes in the mass," and "Great confusion": under D, to "Disgusting barbarities," "Disagreeable events," "Disastrous times," and "Dislike of vestments"; under F, to "Frightful atrocities" and "Frightful cruelties"; under S, to "Striking results of the Reformation." But under the letter T, where nineteen entries begin with the word "The"—such as "The Catholic Church, what it teaches," "The Gallows in constant use," and "The Queen visits Canterbury"—he excels all that has ever been perpetrated in ridiculous indexing.

HEINE'S PROSE.*

Of German prose writers, Heine is, as far as readableness is concerned, without question the first. Indeed it would be difficult to name any writer in any language, except perhaps Voltaire, who surpasses him in this respect. Both Heine and Voltaire, however great or small the subjects may be that they write upon, reduce to a minimum the amount of co-operation which they require from the mind of the reader. They can thus be turned to in the spare moments of a busy life, or in times of physical depression, when almost all other writers would fatigue. Heine's prose has, further, a great advantage over his verse in that it can be translated with not much more loss of life and spirit than is inseparable from nearly all translations. Of Heine's poetry this cannot be said. The best translations are not Heine. Here and there, when the poet happens to be in a commonplace or conventional mood, the translator succeeds in doing him justice; but where Heine is himself he can only be understood and enjoyed in the original German. But a good deal of what is most truly characteristic in Heine comes out as much in his prose as in his verse; and these two little volumes of translations will enable those who cannot read the original to gain an insight into the mind of one of the most striking and fascinating writers whom modern Europe has produced. The *English Fragments* have a special interest for the English reader; but the selection from Heine's prose works in general, most judiciously made and excellently translated by Mr. Snodgrass, gives a much completer view of the qualities of the writer's mind.

Heine, as may be imagined, did not like England or the English. He was bewildered by the noise and hurry of London life. English religion, English morality, English manners, were all an offence to him. He could never forgive us for overthrowing his idol, Napoleon. He could never forgive us for thinking Wellington—"that wooden pedant," as he called him—a great man. But, though Heine is not the writer to whom we go to have our national pride flattered, his criticism of us is often such as may be taken to heart with no little profit. However spiteful it may be, as it sometimes is, it is always the criticism of an intelligent adversary, and from such criticism there is much to be learnt. It nearly always finds out some weak point in our public or social life. Who that moves about in society can fail to see the point of what the critic says, referring to the vain efforts of the Englishman to affect a foreign lightness, of "the whole unrefreshing life of those wooden butterflies that hover about in the drawing-rooms of the West-End"? Who that knows what the state of England was between the battle of Waterloo and the passing of the Reform Act of 1832—in the days of Eldon and Castlereagh—can help feeling that something very like even justice is dealt out to the Radical Cobbett and to his opponents in the following words? After quoting from the *Political Register*, he goes on:—

> So far Cobbett. When I transcribe his words he issues bodily forth again as I saw him last year at the noisy dinner held at the "Crown and Anchor Tavern." I see him again with his scolding red face and his Radical laugh, in which the most poisonous, deadly hatred blends together, in a manner quite awful to behold, with that scornful joy which anticipates the ruin of an enemy. . . . He is the watchdog who attacks furiously everybody whom he does not know, though it be the best friend of the house, the calves of whose legs are not safe from his teeth. He always barks, and just on account of his incessant barking is never heeded when he barks at an actual thief. As a consequence, those high-born thieves who plunder England do not once think it necessary to throw to the snarling Cobbett a crust of bread to stop his mouth. This vexes the dog most bitterly, and he shows his ugly teeth.
>
> Old Cobbett! Dog of England! I love thee not, because every common brutish nature [not a good translation of *gemeine Natur*] is revolting to me; but I feel for thee down to the very depths of my soul, when I see how thou canst not break away from thy chain to reach those thieves who laughingly snatch away their booty before thine eyes, while scoffing at thy futile springs and thine impotent howling.

Heine is full of observations on England which are always acute and suggestive, even when they are only half truths, or even when they are not true at all. "The common people," he says, speaking of aristocratic privileges, "would themselves fight for these privileges with far more zeal than the aristocrats, simply because they believe far more firmly in traditional forms than the aristocrats, who have, for the most part, lost faith even in themselves." And again:—"If you speak to the most stupid Englishman about politics, he always knows how to say something rational. But as soon as you turn the conversation on religion, the most sensible Englishman will deliver himself of nothing but absurdities." The thoroughbred Englishman he detests, he tells us, with his whole soul. "Their prayers," he exclaims, with a sudden outburst of spleen, "their mechanical Anglican devotion, their church-going with gilded prayer-book under their arm, their absurd and wearisome Sunday observances, their awkward piety, are especially repugnant to me. I am firmly persuaded that a blaspheming Frenchman is a more pleasing object in the sight of God than a praying Englishman." Englishmen abroad find no more favour in his eyes than Englishmen at home. He attacks their *ennui*, "their curiosity without interest, their polished clumsiness, their pedantic egotism, and their air of chill satisfaction in the contemplation of all melancholy objects." The

* *Wit, Wisdom, and Pathos from the Prose of Heinrich Heine; with a Few Pieces from the Book of Songs.* Selected and Translated by J. Snodgrass. London: Trübner & Co. 1879.

English Fragments, from the German of Heinrich Heine. Translated by Sarah Norris. Edinburgh: Grant & Son. London: Simpkin, Marshall, & Co. 1880.

Protestant pietists, he says again, "are mystics without imagination, and the Protestant orthodox are dogmatists without intelligence." These are hard sayings, and many of Heine's attacks upon us have lost much of their point through the changes which have taken place in English society during the last half-century. Many, too, of his outbursts are only the ebullitions of a poetic nature which finds itself in the wrong environment, and reacts vivaciously on what jars upon it. But it is very seldom that in any of his criticisms, whether true, or half true, or wholly untrue, we cannot find something worth attending to.

Heine's judgments on the political situation of Europe are of very unequal value. But his blunders are the mistakes of an over-quick intellect. "There are no longer," he says, "nationalities in Europe, but only parties." The strongest force in modern politics—the principle of nationality—was growing up all around him, and he remained unconscious of it. For his own race he felt that mixture of pride and shame which has characterized many gifted Jews. "One has nothing but contumely and misfortune from it. I tell you it is not a religion. It is a misfortune." In a famous passage, again, he says, speaking of Moses:—"He did not, however, like the Egyptians, fashion his works of art out of bricks and granite. He erected human pyramids; he carved out human obelisks; he took a poor shepherd tribe and created therefrom a people fit to defy the centuries—a great, a holy, an eternal people; a People of God, that should serve all other peoples as an example—yea, that should be the prototype of all humanity; he created Israel. With greater justice than the Roman poet might this artist, the son of Amram and of Jochebed, boast that he had erected a monument that should outlive all the creations of brass." Heine predicted that great social convulsion in Germany, compared to which the French Revolution was to be mere child's play, which still declines to come at the bidding of so many prophets. He taunted his countrymen with their inability to do three things which they have since accomplished—the recovery of Alsace and Lorraine, the occupation of Paris, and the completion of the cathedral at Köln. On the other hand, he showed great perspicacity on matters where his brother Liberals in Europe were all astray. He saw through the false pathos which the Polish rising excited. His masterly piece of satire, the *Zwei Ritter*, would make it difficult for anybody who had read it to indulge any more in false pathos on the subject. "His muse," he says of Victor Hugo, "in spite of its majesty, is embarrassed by a kind of German helplessness. I might say the same of his muse as we say of a beautiful Englishwoman—she has two left hands." Of Lessing he says:—"His wit was no little French lapdog chasing its own shadow; it was more like the fierce German tomcat playing with a mouse before strangling it." Mme. de Staël is to him "the passionate woman in all her turbulence of soul, a veritable hurricane in petticoats, sweeping through our peaceful Germany, and everywhere exclaiming rapturously, 'What a refreshing stillness breathes over this land! How delightfully cool it is in your woods! What reviving perfume of violets! How peacefully the greenfinches warble in their German nests! You are a good and virtuous people, and can have no idea what corruption of morals prevails amongst us in the Rue du Bac.'"

It is the quality of all wit to take one by surprise; but hardly any writer gives one so sudden a surprise as Heine. The effect often depends on the inversion of some familiar phrase, as in the case of the old nurse in the charming "Memoirs of Schnabelowpski," who had blond teeth and white hair, or of the fat woman of whom he says that it would be easier for a camel to enter into the kingdom of heaven than for her to pass through the eye of a needle. The address with which he can insinuate a charge is unsurpassed. His gross aspersions on Schlegel and Platen are better forgotten. His reflections on Chateaubriand and Villemain are not, like too many of his attacks, unquotable. Speaking of his arrival in Paris, "I did not," he says, "go to witness the grand opera, because I had come to Paris in order to amuse myself. To my great regret I did not see M. de Chateaubriand, who would certainly have afforded me amusement. Nor did I see M. Villemain, his housekeeper informing me that it was Thursday, on which day he washed himself."

Mr. Snodgrass's volume closes with some translations from Heine's verse, which cannot be said to be even moderately successful. In one of the pieces—the well-known "Es war ein alter König"—the whole point of the poem is missed. The translator makes the queen and her young paramour die of grief, whereas it is perfectly clear that they die of decapitation.

BUNBURY'S HISTORY OF ANCIENT GEOGRAPHY.*

(*Second Notice.*)

In showing that there is nothing even approaching to a geographical system in the Iliad or Odyssey, in the Hesiodic Theogony, in the so-called Homeric Hymns, or in the story of the wanderings of Io as related in the *Chained Prometheus* of Æschylus, Mr. Bunbury has done a service to the study of geography the value of which cannot, we think, be easily overrated. He has, we believe, once and for all cleared the ground for a thoroughly impartial and unprejudiced examination of the geographical statements of later writers, and entirely removed the prepossession which regarded the positive assertions of ancient geographers as an ark not to be touched lightly or with irreverent hands. Nor, probably, would this prepossession have been removed so effectually by a book thrown into any other than the historical form which Mr. Bunbury has adopted. The *Dictionary of Geography* would correct beyond doubt the several errors of Herodotus or his successors on particular points; but for the majority of readers it would not touch the general impression that those ancient writers wrote with an accurate knowledge of the places mentioned by them—a knowledge to which they could lay claim only in rare instances. Mr. Bunbury has shown that, even for the scientific geographers who followed Eratosthenes, the conditions under which fresh discoveries were made or fresh information obtained can scarcely be said to have differed essentially from those which determined the notions of generations which preceded the dawn of a written literature.

Such a position as this, it is clear, can be established only by a patient and minute examination of the maps of the world exhibited by the whole series of ancient geographers. This task is, as we have seen, one which renders necessary a considerable amount of repetition. The process may not be altogether inviting, and the volumes which give the result may not furnish the lightest and the most attractive reading. But for real scholars and students this method will have a value which will more than compensate for a few inevitable disadvantages. The only point as to which they would have to assure themselves would relate to the trust to be placed in their guide. To test all his statements would be a work scarcely less arduous than that which their guide professes to have performed for them; but a careful sifting of any section will, we think, fully satisfy them of Mr. Bunbury's trustworthiness and of the scrupulous accuracy which marks his quotations generally. We have detected but few mistakes, and none of any importance. It is not easy to see in the passage cited from the Odyssey (iv. 563 *et seq.*) that Menelaus "was destined to a separate existence apart from the other dead." Taken in their natural sense, the words imply that he will reach the regions of the blessed without undergoing the doom of death in his own person. Nor can it be said that even within the Arctic circle there is a night of six months' duration, if the expression is to be construed strictly as denoting the complete absence of the sun for the entire half-year (i. 198). It is a little perplexing to be told that the name of the Hercynian forest appears for the first time in the pages of Theophrastus (i. 604), when Mr. Bunbury has already expressed his opinion that the Arkynian mountains of Aristotle are evidently an exaggerated notion of the Herkynian forest in Germany (i. 400). It can be merely a slip when Mr. Bunbury speaks of Augustus as ascending the Roman throne (ii. 145), when there was no throne to ascend; but, if we understand the passage of Arrian aright, it is more nearly an error to say that Alexander the Great wrote to his mother a letter identifying the Indus with the Nile, which appears to have been extant at a later period. If Arrian may be trusted, Alexander, there can be no doubt, supposed the Indus to be the Nile because he saw crocodiles in it, but, on finding out his mistake, he cut out the whole passage from his letter. These and one or two other insignificant flaws scarcely call for notice; and the reader may therefore trust himself without misgiving to Mr. Bunbury's guidance. If he has patience to follow him through both his volumes, he will be well rewarded by the clearness with which the uncertain and oscillating growth of geographical knowledge is traced through the long series of writers from Hekatæus to the latest disciples of Ptolemy. As he turns from one map to another, he may be surprised to find that the later maps betray in some points errors of a much more serious character than the earlier ones; but he will have learnt an invaluable lesson in the evidence thus furnished to him that scientific ideas are practically useless apart from exact and well-ascertained observations. Such observations could be obtained only in the rarest instances. The position of Massalia might be marked with accuracy; but if Byzantium was placed (as it was by some) on the same level of latitude, the result must be a strange distortion of the map of nearly half Europe. The student will thus learn that the statements of ancient writers are not to be trusted implicitly, even when they happen to be borne out by more recent explorations. Thus Herodotus distinguishes the Tanais from the other Scythian rivers as flowing from a lake which he styles a great one. On this Mr. Bunbury remarks:—

> In point of fact the Don does rise in a lake, while the Bug and the Dneister do not; but it is one of such very small dimensions as not even to figure on any ordinary map of Russia, and it is wholly inconceivable that the informants of the historian had sufficiently accurate knowledge of these remote regions of the interior to be aware of this minute fact, while their general notions were so vague and incoherent.—i. 184.

We cannot indeed impress too strongly on our minds that the geographical knowledge possessed by Thucydides or Aristotle was the result of observations amassed during a long series of centuries by colonists, traders, pirates, kidnappers, and military leaders. Of explorations undertaken purely for the sake of advancing geographical science we have but a few instances; and of these some, to say the least, must be classed amongst incidents the reality of which we cannot hope to establish. To this number belong some of the voyages which have received the name of Periplі, or circumnavigations, although they were chiefly expeditions along a single line of coast which involved no circuit. The narratives of these voyages have not been treated with perfect fairness by

* *A History of Ancient Geography among the Greeks and Romans from the Earliest Ages to the Fall of the Roman Empire.* By E. H. Bunbury, F.R.G.S. 2 vols. London: Murray. 1879.

modern writers; but Mr. Bunbury, we believe, holds the balance truly between undue credulity and unreasonable doubt. Sir Cornewall Lewis had rejected with a decisiveness bordering on contempt the records of the voyages of the Massalian Pytheas; Mr. Bunbury remarks that he did so "without adverting to the points in which our present full knowledge of the northern regions of Europe has shown that Pytheas was right, and Polybius and Strabo were wrong" (i. 612). The great critic who made such havoc of the professed historical records of ancient Rome before the Punic wars had rejected not less summarily the story of the African Periplus by the ships of Pharaoh Necho. The reasons which led Ephorus and Eratosthenes to dismiss it as incredible are manifestly worthless; but it cannot be thrown aside on the ground of insufficiency of time for the enterprise. Major Rennall held that this was quite long enough, while he adds the perfectly true remark that if the voyagers passed Cape Guardafui at the right season, "they would be favoured by the northern monsoon as far as the southern tropic, and would also have a strong current in their favour the whole way round the Cape of Good Hope"; and that on the western coast, while they remained in the southern hemisphere, they would be able to reckon generally on a favourable wind as well as a northward current. They would thus have almost everything in their favour, and the enterprise would have a chance of success which it could not have if the ships sailed from Egypt to the Pillars of Hercules, and thence attempted to coast round the African continent. To these considerations must be added the statement that the navigators in sailing round Libya had the sun on their right hand. If the Periplus was accomplished in fact, this would be true; but we have to determine first whether the notion of this fact would not be obtained without the passing of Cape Agulhas:—

The Egyptian priests were well aware [Mr. Bunbury remarks] that the sun was vertical at Syene at the time of the summer solstice; and it was an inference so natural as to be almost inevitable that any one proceeding further south would have the sun to the north of him. The frequent intercourse with Meroe would confirm this view. It is probable moreover that Phenician navigators had already frequented the coasts of the Erythræan sea, considerably to the south of the tropic of Cancer; and even in the particular voyage in question, if we suppose that the narrative had *any* foundation in fact, and that an exploring expedition was really sent out by Necho, it would easily have attained to latitudes where the phenomenon in question might be observed during a part of the year. Nothing is more common than to have theoretical inferences converted into statements of fact.—i. 293.

At the same time it must be admitted that the argument drawn from the neglect of the discoveries made by this Periplus, supposing it to have been carried out, has no weight. Captain Cook is supposed to have discovered the eastern coast of New Holland; it had really been explored by a Dutch voyager a century and a half earlier. The discovery of North America, under the name of Vinland, by the Northmen in the eleventh century, is now an admitted fact; but it led to no solid results, and to all intents and purposes Columbus withdrew the veil for the first time from the New World. It can scarcely be doubted that the Samian Aristarchus propounded the whole heliocentric system of Copernicus and Newton, if we except the formal statement of the principle of gravitation; but on the subsequent course of Greek astronomical science it had no influence whatever. On the other hand, if we put on one side the incident of the northerly sun, the story of the Periplus is marked by a complete absence of geographical details. No mention is made of the change of seasons in the southern hemisphere,

a circumstance which must have been the more strongly impressed upon the minds of the navigators from its intimate connexion with the choice of times for halting, with the purpose of sowing and reaping corn for their own supply. Nor is anything said of other changes in the celestial appearances, such as the disappearance of the Great Bear and the pole-star, by which the Phenicians were accustomed to steer, and the loss of which must therefore have been a source of great perplexity to them in the southern hemisphere.

It may be said that the narrative of Herodotus is very brief, and furnishes us with next to no details of the voyage; but to this Mr. Bunbury makes the obvious reply, that this very brevity "leaves us simply to choose between the bare statement of the fact on one side, and its great intrinsic improbability on the other."

A far more important incident in the history of discovery is the so-called Periplus of the Carthaginian Hanno, who, beyond doubt, penetrated to the latitude of Sierra Leone from the colony which he established at Cerne. But, unless the position of this spot can be determined, the geography of the whole voyage must remain vague and indefinite. We are, however, told that it was an island in the bight of a deep bay, and that the distance between it and the Pillars of Hercules was much the same as the distance between the Pillars and Carthage. This distance is exceeded by 320 geographical miles if, with Rennell—who was followed by Ukert and Movers—we identify Cerne with the island of Arquin, which lies a little to the south of Cape Blanco. Even a strong southward current will not account for so large an error in the reckoning; and some, accordingly, have placed Cerne near Aghadir or Santa Cruz. But this falls as far short of the distance stated by the Periplus as the other exceeds it, and there is no island answering to the description in the neighbourhood. The true position, Mr. Bunbury remarks, has been pointed out by Dr. C. Müller at a point intermediate between the two, where an island, still called Herne on the French charts, is seen in the bight of a deep bay at the mouth of the Rio do Ouro. This point being determined, the mountain called Theôn Ochêma is easily identified with the conical hill named Sagres by the Portuguese. Three days' further movement southward brought them to the Southern Horn, whence they returned in terror at the streams and pillars of fire which seemed to bar all progress. This statement brought the narrative into special discredit with later geographers; yet the explanation is found in the practice, still maintained on this part of the coast, of setting fire in the autumn to the long grass, and filling, seemingly, the whole land with conflagration.

The Periplus of Hanno can scarcely be compared with that which bears the name of Scylax, and which, as it mentions the founding of the Athenian colony of Neapolis on the Thracian coast B.C. 360, and speaks of Olynthus, which was destroyed in B.C. 347, as a city still existing, must have been drawn up between those dates. This was the first professed geographical treatise, and it gives chiefly the results of information obtained from merchants or travellers about countries which the compiler had probably not seen, or with which he had a very imperfect acquaintance. But among the documents bearing this title one or two exhibit a very different character. The Periplus of Nearchus, of which Arrian has fortunately preserved to us a full abstract, was the genuine narrative of a coasting exploration undertaken for combined military and commercial purposes. Far more remarkable for the character and accuracy of its details is the Periplus of the Erythræan Sea. It was drawn up, seemingly, about the time of Pliny, by some merchant of Alexandria (the idea of Arrian being the author is now generally given up), and furnishes the exact sailing directions which are needed by traders, and which, more than any other kind of information, tended to bring ancient geography into anything approaching correctness of form. Mr. Bunbury carefully examines this little work, which, for the clearness and exactness of its statements and for the amount of geographical knowledge which it displays of the coasts both of Africa and of India, he regards as entitled to special consideration. The writer was fully aware that the African continent, from a point at least forty miles to the south of Cape Guardafui, had a general direction to the south, "instead of trending away at once to the west, as supposed by all earlier geographers from Eratosthenes to Strabo." The means were thus furnished for correcting one of those strange distortions of coast line which disfigure the ancient maps; and perhaps it may be said that, in the larger number of cases, these distortions might have been corrected by aid of information not much less trustworthy than that of the Erythræan Periplus. But, unfortunately, the progress of geographical theory tended not seldom to make matters worse instead of better. The accurate determination of one point, taken with another which was glaringly incorrect, might disfigure the map of the world itself; and the degree of distortion betrayed in the most scientific of the ancient maps is astonishing enough, until we remember that no geographer was in possession of exact data for the whole ground of which he professed to treat. The geography of Ptolemy is cast into a scientific form; yet his outline of the North African coast is almost more erroneous than that of Herodotus: nor can we well attach too much weight to the remarks of Mr. Bunbury on this point of cardinal importance. The assignment of latitude and longitude for a series of ports or inland cities is only the mode in which Ptolemy, following in the lines of Hipparchus, expressed the conclusions drawn from the statements of his authorities, and the conclusions thus presented have no more intrinsic authority than the original statements expressed in the popular language.

But this [Mr. Bunbury urges] is precisely what has been too often lost sight of. The blind, and almost superstitious, reverence with which Ptolemy was regarded throughout the Middle Ages, has descended in some degree to our own days; and it is not uncommon to find writers referring to his statements as if his *apparently* definite and scientific results must necessarily be based upon definite information and scientific calculation. Yet it is certain that he possessed no materials that could enable him to arrive at any such conclusion. It has been well remarked of him, as of the Greek writers in other instances, that their theoretical development of science far outstripped their power of its practical application. He saw clearly the true principles upon which geography should be based, and the true mode in which a map should be constructed. But the means at his command did not enable him to carry his ideas into execution; the substance did not correspond to the form; and the specious edifice that he reared served by its external symmetry to conceal the imperfect character of its foundations and the rottenness of its materials.

A full appreciation of the extent and nature of the difficulties which beset the ancient geographers on every side can be attained only by the historical method which Mr. Bunbury has applied to the whole mass of geographical information stored up in Greek and Roman literature. He has applied this method with unwearied patience and unfailing care; and the result is a work which entitles him to the gratitude not only of geographical, but of all historical, scholars.

NO RELATIONS.*

M. HECTOR MALOT is one of the few French novelists who may congratulate themselves on winning fame and popularity without pandering to impure and vitiated tastes. His novel of *Sans Famille*—"No Relations," as the title is translated in the English edition—gained him the Monthyon prize of virtue of 25,000 francs, and deserved to gain it. The story is at once simple and interesting, and may be recommended to both old and young as safe family reading. M. Malot carries

* *No Relations.—The Monthyon Prize Novel.* By Hector Malot. Edited by the Author of "Hogan, M.P." &c. Richard Bentley & Son. 1880.

us all over France and brings us in contact with many ranks and conditions of men in the course of his little hero's peregrinations. Now we are with peasants; now with mountebanks; now we are among a mining population and are left at the bottom of a coal-mine by an accident which spreads a fever of excitement round the neighbourhood. Occasionally we find ourselves with people of position and education; and again we are cast abroad upon the world, mixing with thieves and most disreputable members of the dangerous classes, and brought into disagreeable contact with magistrates and officers of justice. Incident follows fast upon incident, and adventure crowds upon adventure, as these pictures of quiet landscapes and the life of cities, in which M. Malot excels, are perpetually changing. Yet he never gives a shock to our sense of the proprieties; nor, except perhaps in a single instance, are our feelings unnecessarily harrowed. Little Remi becomes professionally a vagabond, and is thrown by the chances of his unlucky fate into what might have been circumstances of extreme temptation. That he does not succumb is owing, in the first place, to his own frank and honest disposition, and his natural predilection for good rather than evil. And it is by no means so unnatural as it may appear at the first blush that he should touch pitch without being defiled. He had had all the advantages of a decent moral education, having been tenderly brought up through his childhood by a worthy and affectionate peasant woman. When he is forced suddenly to leave the shelter of her roof by circumstances which neither he nor she can control, he finds himself handed over to a venerable gentleman who picks up a precarious livelihood on the roads. But Remi's new master is superior to what he seems; while his misanthropy, which holds him aloof from low companions, makes him a more trustworthy guardian than he might otherwise have been. Subsequently one of the vicissitudes of his chequered lot leaves Remi companion to a little English invalid of his own age, who is presumed to be the only child of a rich and doting mother. The English lady is all that is graceful and refined, so that Remi is confirmed in his honest aspirations before being separated for a time from these kind friends and patrons. Throughout the story M. Malot dwells by preference on the brighter and more kindly aspects of human nature. Not that we are not casually introduced to a variety of wicked or repulsive characters; but those appear to be generally brought in for purposes of contrast, and are somewhat summarily dismissed when they have figured in the parts assigned to them. He excels in his pictures of cottage interiors, among virtuous peasants and the deserving city poor. But what his younger readers especially will most delight in is his studies of animals as developed by close companionship with man. M. Malot must evidently have lived in intimacy with dogs of high intelligence and delicate susceptibilities; and we should say, from the happy touches with which he has worked out the eccentricities of the facetious M. Joli-Cœur, that the portrait must have been painted after nature from some pet monkey of his own.

When we first make the acquaintance of the little Remi, he is happy and thoroughly contented. He is the adopted child of Mother Barberin, who is rich in the possession of a cow and fortunate in the absence of her husband, who had gone to seek work in Paris. An unlucky accident that happened to Barberin is the beginning of Remi's varied experiences and of his adventures, good and bad. So long as that respectable *père de famille* was in receipt of wages, he left his wife very much to her own devices; but when he is crippled and laid up in hospital at Paris, he begins to send her urgent messages. The cow must be sold; and that lamentable domestic bereavement was Remi's first great sorrow. We do not exaggerate in calling it a lamentable bereavement. It is true that the milk and butter had enabled them to fare luxuriously; but, to do them justice, in parting from the beast it was not only the privations they were to suffer that affected them. Their cow had become their friend and companion. "She understood us; and, with her great, round, gentle eyes, she well knew how to make us understand her feelings and desires. In a word, we loved her and she loved us." So it was sad to put her halter into the hand of the matter-of-fact dealer who had begun by depreciating her good qualities by way of beating down her price. A more bitter separation was to follow, when Remi himself had to go. Barberin had come back, like a prodigal father; and his first idea was to rid his cottage of this useless mouth. Then Remi, like the cow, fetched a sum of money. The purchaser in this case was a striking-looking old man, attired something like a mountaineer of the Apennines—in a tall grey hat, sheepskin doublet, tunic of faded velvet, and woollen gaiters fastened with ribbons. Still more strange and fantastic was the troupe he travelled with, which was composed of three dogs and a monkey. There is a moving description of the boy's grief when he looked back as he was being led over the ridge above the cottage, and saw his foster-mother at work in the garden, unconscious as yet that he had been sent away from her. But we are prepossessed in favour of his new master when we find the old man speaking gently and sympathetically to the boy, and urging, besides, that even the conduct of Barberin should not disgust him with human nature. Barberin was bound to live, and would find living hard enough work. It is exceedingly natural, too, that Remi should be somewhat consoled in the midst of his sorrow by the promise of hob-nailed shoes and a pair of velvet breeches. It is a world of novelties and marvels that lies before him. He had already been dazzled by a visit to the interior of the village café, of whose splendour he had as yet had but a faint glimpse, as he cast casual glances in passing through the open door. He rallied his spirits during the afternoon; at night, however, he is overpowered by a scene of helpless desolation. After a wet and weary march they had been refused shelter in the village, and had to content themselves with rough quarters in a barn. As Remi lay in the darkness utterly miserable, curled up and shivering on a heap of fern, he felt a warm breath on his face. He stretched out his hand, and it rested on a woolly coat. It was Capi, the poodle, who had crept to him to offer his sympathy. "He stretched himself presently on the fern close by me, and began to lick my hands gently. Quite touched by the caress, I raised myself and kissed him on his cold nose. He gave a little stifled whine, then quietly laid his paw on my hand and lay still. Then I forgot my weariness and my sorrows; my choking throat was relieved; I breathed once again, for I was no longer alone; I had a friend."

Capi's friendship never belied itself; and Remi got on very well with the rest of the *troupe*, even when separated from his master, and temporarily in command. It was M. Joli-Cœur, the monkey, who caused him most anxiety. Not that Joli-Cœur had a bad heart, or was naturally vicious. But he was something of a sensualist, and supremely egotistical. He could not endure patiently the privations, which came to the little party of performers often enough; and he would never be serious for more than a minute, even in the gravest circumstances. But Remi came to know him too well to feel hurt or annoyed; and though he had none of the affectionate regard for him which he entertained for the estimable Capi, yet he missed him sadly when the monkey died of a chest complaint. There is a very melancholy and touching account of its last illness. For tragedy had succeeded to tragedy. Not only had Joli-Cœur been carried off by a complaint caught by exposure, but two of the dogs had been snapped up by wolves when the party had been overtaken by a snowstorm in the middle of a forest. Then his good-natured master had perished of cold in Paris, having found the great city as inhospitable as the forests or the solitary *landes*. Remi owed his safety to the charity of a family who could ill afford to bestow it, but for which he had ample opportunities of showing his gratitude. When he sets out upon his wanderings a second time, a veteran in experience, though a child in years, he has a little travelling comrade of his own age. The companionship proves a godsend and a source of fortune as well. Mattia is a Savoyard, with a genius for music, who plays the violin admirably and makes money more quickly even than Capi. Compared to Mattia, Remi had hitherto been lapped in luxury. His appeal to Remi, when imploring him to take him with him, is eloquent of all the sufferings he had undergone. "If I do my work badly you can beat me—that's agreed; all I ask is, that you won't hit me about the head. You must agree to that, because my head's so tender, ever since Garofali knocked it about so much." They find patrons everywhere, make money fast, and are cordially at one as to the disposal of it. Remi is to buy a cow for Mother Barberin, to replace the old friend she had sold. There is a good deal of quiet humour in the story of the purchase, of the subsequent escape of the much-prized animal and its recovery from the authorities, who had laid an embargo on it, and of the triumphant success of the delightful surprise they had arranged for Mother Barberin. The natural incongruities between the methodical habits and the juvenile impulses of the pair of boys are admirably worked out. They toil hard; they live sparingly and self-denyingly; they are cautious, thoughtful, and intelligent far beyond their years. Still they are boys, and almost children, after all, and every now and then they remember that. "Mattia often said to me, all of a sudden, and for no reason at all, 'Let us have a game.' Then in a twinkling, the knapsacks, musical instruments, and all were pitched to one side, and we began to play on the road-side; and more than once, were it not for my watch, we should have played all night. But the watch reminded me that I was chief of the troupe, and that we must work—must earn money to live on. Then I slung the harp on my galled shoulders once more, and set off. Forward!"

The most sensational event in Remi's eventful life is his entombment in an inundated coal-mine, where he has been doing the duty of an apprentice for a friend. The warnings that preceded the catastrophe, the sufferings and talk of the imprisoned group of colliers, the display of the men's innermost characters under the alternations of exaltation and profound depression, are elaborated with a minute fidelity that gives a strong impression of reality. And Remi's boyish love affair with a little dumb girl who was his good angel when he was on the point of starving along with his master, and for whom, in his gratitude, he conceives a romantic attachment, is charmingly told. We do not like the scenes in England, whither he has been sent by the intrigues of the leading villain of the book, who turns out to be his wicked uncle. Artfully compromised and unjustly charged with a criminal offence, he escapes from the perils that seem certainly to await him, by startling and surprising devices that say little for the astuteness of our police. Clearly M. Malot has striven conscientiously to get up the English portions of the subject; but like all French novelists, almost without exception, his natural forces fail him when he sets foot upon English soil. And the *dénouement*, though eminently satisfactory to Remi, as it restores him to a wealthy and affectionate family, sounds distinctly improbable to the dispassionate reader; while in the closing scenes, ranks and classes are confounded in a manner that reminds us of the motley mob that covers the stage in a pantomime

transformation. But these are blemishes that would scarcely spoil to French readers a story that is consistently excellent in all its characteristic features. We may add that the translator has done his part of the work satisfactorily, though all good French novels must lose more or less in the translating.

FARMING FOR PLEASURE AND PROFIT.*

IN the autumn of last year we hailed with a mixture of curiosity and satisfaction the experiments in dairy-farming and poultry-keeping of an amateur agriculturist, whose account of himself was that the health of his wife and young children rendered it expedient for him to take a small farm within an easy distance of town, and combine with his commercial occupations the pursuit of agriculture on a limited scale, with a view to home consumption and the supply of butter, milk, eggs, and poultry to the London markets. Beginning in a small way, endowed with much perseverance, and fortunate in being served by a trustworthy bailiff and helpers on whom he could rely, Mr. Roland, as his earlier volumes set forth, prospered in the farming industries which he there details. The first of his books, that on dairy-farming, contained many useful hints which won it a welcome from the readers of such literature; and the success of these volumes has apparently induced the author to complete the cycle of his "Farming for Pleasure and Profit," and furnish his readers with the results of his experience in stock-keeping, draining, and root-growing. It is to these that we now propose to devote a few remarks.

And first as to stock-farming; and, in particular, to a branch of it interesting to every family which has garden stuff, a wash-tub, and the other familiar appliances of pig-feeding. It is doubtless good advice to keep Berkshire pigs, as being the hardiest, the least susceptible to weather, and the best to cut up for bacon from their large proportion of lean flesh. If always kept in their styes, the manure is very profitable (Mr. Roland calls it "the sheet-anchor of his hops"), though many turn out their pigs to graze, as indeed it may be well to do with breeding sows. Between the smaller and larger breeds, in view of an equal demand for pork and bacon, it will be found that the Berkshire breed is better than any other on a farm where there is a mixed produce and plenty of rough food to be consumed, though dairy-farmers who do not rear calves on skim-milk will find a small fine breed fatten quicker on it, and command a ready sale as porkers. Instead of giving us a "march past" of all the breeds of swine, Mr. Roland would have done well to single out a few of the best, whether pure or as crosses; for it is of less practical advantage to know of the "ould Irish breed that it is as big as a jackass," or of the Rudgewick breed that some samples of it have reached the weight of an ox, than to learn the art of so crossing the larger breeds as to realize the best combination of size, form, and quality in a given animal. The good effected for the original Essex breed by seasonable crossing with black Neapolitans and black Chinese is an instance of this. "The true Berkshire hog," we are told, "is of a reddish-brown colour, with black spots, the head well balanced, with ears generally standing forward, though sometimes hanging over the eyes. He is short-legged and small-boned, with a rough curly coat that by its appearance would seem to indicate both coarse skin and flesh. Yet no pigs make finer bacon. They can be made to attain a very large size, 100 stone having occasionally been reached, though from forty to fifty stone when fattened is the more general average." Even here, however, the original stock has been improved by a cross of the black Berkshire with the Neapolitan, and of the white with the Chinese, in an increase of aptitude to fatten in the early stages of growth. In his second chapter Mr. Roland makes good his judgment in regarding the black Berkshire as best suiting his purposes, and distinguishes between the breeds needed for the supply of London and large towns. Store pigs can only pay where there is an opportunity of turning them out, and an ample run. The amateur pig farmer will find in the fourth section undeniable criterions of the model pig, from the full cheeks and short straight frontispiece to the broad shoulders and broader chine, short legs, and earth-trailing belly. The author's experiences in cheap purchase of brewers' grains for pig feed are more applicable to town farmers than to those further afield; but many of his practical remarks how to feed pigs economically and profitably are deserving of all attention. Cooked or steamed food is infinitely more effective than uncooked. Mr. Roland appends to his remarks on pig-feeding, as to his several surveys of sheep and oxen, useful chapters on the diseases of the different animals, with remedies tested by him in different emergencies. While accepting *cum grano* his assurance that the pig is not so dirty as he is commonly accounted, we quite admit that, with due attention to his health, diet, temperature, and cleanliness, he is a more profitable as well as a more pleasant beast than where he is left to his normal wallowing in the mire.

In the chapter on sheep, where the author passes in review the best breeds in youth, age, health, and disease, it is probably because the epidemic among sheep, far more serious than "foot-rot," which has destroyed whole flocks during the past winter in the Western counties, occurred since this book was written, that no notice whatever is vouchsafed of so serious a cause of the present agricultural distress. The disease we refer to is apparently a "rot" all over, which smites a flock so widely that the unfortunate farmer has to anticipate the stroke of pestilence by the sale of his doomed sheep, at a ruinously low price per head, to the butchers who purvey cheap meat for the large population of the "Black country." Our surmise is that Mr. Roland happily knows nothing of such experiences. As regards oxen, he rightly regards the stock-keeper's true aim as being the marketable value of the carcase—in other words, largest size, with early maturity, at the smallest cost; and here he reckons the improved shorthorn as *facile princeps* in putting on flesh, though the cows are not, unless in exceptional cases, the best of milkers. The *pros* and *cons* of oxen as draught animals, fed on grass in summer and straw in winter, and, when no longer fit for work, consigned to the butcher, are so utterly a question of the past, in some at least of the counties of which Mr. Roland speaks, that a yoke of oxen and driver is now scarcely to be seen. It is hard to fight the battle of the Herefords against ever-increasing odds in behalf of the shorthorns, though there are still many who prefer them, and these not, we suspect, so exclusively in their own district as Mr. Roland thinks. We have certainly met with them in Montgomeryshire and elsewhere on rich fertile soils, justifying their reputation as a good grazing breed, and showing the same good taste as their shorthorned and more fashionable rivals in requiring good keep, not coarse scanty pasture. Unquestionably the shorthorns bear the palm "in short back and long frame with a fine mellow handle, in being velvety to the touch with a plentiful supply of soft, mossy hair, and a hide very soft, while not too thin." Many are ready for the butcher at two years old, and five-year old steers range from 140 to 150 stones of 14 lb. For poorer pasture our author offers us the choice of a mixed breed, in crosses of shorthorn with Alderney and Ayrshire, Aberdeen, Angus, and Fife, and divers other Highland or English breeds, which we can testify do exceedingly well on average park-pastures and are in great request for the butcher, while the cows give a little, though rich, milk. In the sixth chapter, on stock-feeding, some sage help is given towards deciding between boxes, stall, and yards for feeding cattle. The best compromise is covered yards.

Into the mysteries of drainage of land, discussed in the fifth section, it would be useless to enter cursorily, though we fully subscribe to the author's advice to engage for such work only a thoroughly qualified drainer, and not the mere clever workman who has watched a job or two done scientifically, and thinks "hur could do that hurself." We miss, indeed, one important counsel which might prevent much labour lost—namely, that in the case of extensive draining on an estate, sketch maps and plans of the operations should be made at the time, and preserved as memorials to other tenants, and perhaps to other landlords, of the course of this or that drain, when perchance choked up or forgotten in after years. Perhaps the scale of Mr. Roland's operations did not require such a record. On the whole subject, however, we should prefer to trust such experience as that of the author of "Agriculture" in the new edition of the *Encyclopædia Britannica*, who (*inter alia*) advocates four feet as the minimum depth for all drains, whereas Mr. Roland (p. 335) is content with three. In the chapter on Irrigation there is much interesting matter on the too-often neglected treatment of "water-meadows," and a specially instructive episode on the highly profitable conversion in Lombardy of barren sands and unhealthy marshes into fertile meadows by irrigation. Our author states that the meadows lying on the south of Milan are dressed by the sewage water from the city, and are cut seven or eight times a year, and in some instances as many as nine times. In his other chapters he collects the results of his experience in manures, invoking here and there the corroborative evidence of chemists and agriculturists. As he notes in p. 187, Barnaby Googe's dictum in the sixteenth century that "'lime and marl' are good for the father, but bad for the son," is not borne out by modern farming experience.

The bulk of the last or sixth section is devoted to a survey of English root crops, *i.e.* turnips, mangolds, carrots, parsnips, artichokes (Jerusalem), and potatoes, with suggestive hints for growing, ripening, storing, and making the best of each; and we have a supplementary chapter on the cultivation of hops, a staple of English agriculture and commerce which since its introduction from Flanders in 1524 has found a second nursing-mother in England. Of the roots, mangolds like a moist rich soil, carrots a friable and sandy, and turnips a light, dry, pliable soil, or the opposite to a heavy clay. From the loving pains with which Mr. Roland lingers over the subject of swedes and turnips in general, we should judge him to have found his account in making turnip crops a main source of supply in stock-feeding. His maxim is "to use your turnips first, and depend on mangolds for later feeding of stock." Carrots, however, are a paying and feeding crop for horses, cows, and pigs, especially with the addition of some oats, hay-chaff, or barley-straw to correct the laxative tendency of carrots alone. Parsnips thrive better on a stiffer soil, and both these roots are peculiarly exempt from the attacks of the weather or of insects. Two great recommendations of the Girasole, or Jerusalem artichoke, are that they need no storing, and may be grown in any odd corner. Sheep eat them with avidity, and they are largely used by Mr. Roland for his pigs. We must pass over his remarks on the potato in health and disease to devote a sentence or two to his hop-land, in regard to which he seems to have been prompted as much by a

---

* *Farming for Pleasure and Profit.* Fourth Section: Stock Feeding and Cattle Rearing. Fifth Section: Drainage of Land, Irrigation, and Manures. Sixth Section: Root-Growing and the Cultivation of Hops. By Arthur Roland. Edited by W. H. Ablett. London: Chapman & Hall (Limited). 1880.

view to ornament as to profit. As his five acres of hops lay contiguous to his house and garden, and he waited a few years before taking them into his own hands, his ash spinnies and plantation of Spanish chestnuts were ready in the nick of time for the climber, while the pigs provided abundance of manure. Anon he turned his kitchen garden into a flower garden, and hung a gate to connect this with his hop yard, which was rendered picturesque by festoons over grass alleys, while the seven or eight-foot margins of the enclosure furnished space for vegetables, fruit espaliers, and currant and gooseberry bushes. He admits that he incurs the sneers of his neighbours (and he must have plenty of competent critics of Farnham hops on the borders of Surrey and Hants) by anticipating the possible failure of a crop by planting something else between every other row, and so lessening his risk from casualties; but he can bear a little chaff if he not only pleases his eye, but gets in fair years as much as 5 cwt. an acre. He finds a calcareous subsoil the best security for the duration of a hop ground. Mr. Roland's details on the cultivation and management of hops are as interesting and instructive as any part of his volumes; perhaps this is because the subject appears to be one of his special hobbies. His chief drawback as a writer is discursiveness, and yet some allowance must be made for discursiveness when it leads him to moot such questions as the best mode of "securing skilled and efficient labour," "better housing of workmen," "beer v. no beer," and the like. Yet it is surely a mistake to condemn beer and cider, though the part payment of wages in them is justly blamed as vicious. In conclusion, we cordially agree with our author that, in the event of a continued demand at home for all kinds of American produce, "the plain course before British farmers is to produce the things which will pay them to grow and rear," to grow beef instead of corn, and "to conciliate the remunerative market at their own doors for dairy produce," and we might add, for poultry, fruit, and vegetables.

FRENCH LITERATURE.

THE third and last volume of the Memoirs of Madame de Rémusat (1) is somewhat less interesting than its two forerunners. This simply arises from the fact that the author deals more with public, and therefore well-known, events than with what passed behind the scenes. Such matter of private interest as this volume contains rather concerns the relations of Madame de Rémusat herself with Talleyrand than her dealings with Napoleon and Josephine. Yet the volume has plenty of attractions. There is, to begin with, an interesting preface written by Charles de Rémusat some twenty years ago with a view to the present publication, and containing some references to the Second Empire, and to the probable future of the Napoleonic cult in France, which are well worth reading. Here and there too are curious bits of anecdote. Such is the story of the Emperor, when about to start on one of his campaigns, putting one arm round Josephine and the other on Talleyrand's shoulder, and saying to M. de Rémusat, "It is sad to leave the two persons one loves best in the world at once." Another curious incident is the famous interview of Napoleon with the wife of Herr von Hatzfeld, in which, for a wonder, the latter obtained her husband's pardon; the pardon being, as one story has it, due to the fact of the Emperor having discovered that the evidence against his victim was worthless, and wishing to gain credit for clemency cheaply. Yet a third is to be found in a note in which M. Paul de Rémusat states that his father had heard from General Foy the account of a singular conversation with Napoleon on Spanish affairs, wherein the latter roundly stated that English troops always had beaten French ones. Such things as these have made this work the most interesting of its kind which has appeared for many years, and if they are not more abundant in the present volume, it must be remembered that in the period it covers M. and Madame de Rémusat were already somewhat out of favour.

While Mme. de Rémusat's Memoirs concern chiefly Napoleon's private life, the interesting publication (2) in which M. d'Eckmühl has been endeavouring to clear his father's memory throws a good deal of light on the conduct of the Emperor outside his home. It may be at once granted that M. d'Eckmühl has shown that, whatever Davout's conduct at Hamburg and elsewhere may have been, it was always far milder than his orders, and that to his own relations and friends he was gentle enough. The Marshal's letters to his wife are indeed almost as interesting as Marlborough's. The book, too, exhibits very well Napoleon's constant habit of trying to sow discord between his generals (a habit which resulted, with rare poetical justice, in the disasters of the Spanish campaigns), and also his tyrannical method of prescribing what his Marshals and their wives should do. At one time the Emperor orders that the Princess d'Eckmühl shall give a ball, at another he complains that she does not keep up a sufficiently large establishment. Principalities and pensions and offices might seem to some people rather dearly bought at such a rate.

M. Zevort's monograph on the Foreign Ministry of D'Argenson (3) is a less interesting and less well-executed specimen of the same kind of work, but contains valuable information for the student of mid-eighteenth century history. The very curious personal character of D'Argenson is rather hinted at than fully drawn, and, as the period dealt with was a mere fragment of his life, the book is to a certain extent deficient in dramatic interest. As to the relations of the different European States at the time it is very copious. In particular it illustrates well a curious and disastrous habit of French statesmen. Unconscious of the thoroughly rotten state of France, they seem to have been constantly busied with schemes for reconstructing Europe exactly as in the days of Henry IV. and Richelieu. Napoleon said that Fontenoy prolonged the Monarchy for forty years; he might also have said that it made its fall certain.

M. Girard, a captain of engineers in the Belgian army, has written a somewhat ambitious essay (4) on the general relations of science and philosophy, with the object of making the latter a "science of sciences," embracing at once the principles and results of all scientific inquiry.

The relation of Christianity to social progress forms the subject of M. Ribot's compact but far from summary treatise (5). The author decides that the spirit usually designated (on the Continent rather than in England) as "revolutionary" is only a passing manifestation, and that a return to Christian principles, if not to any specific form of Christianity, is for European peoples a necessity. This inquiry is supplemented by a discussion of the social and economic theories of M. Le Play.

The sketches to which, following the example of his illustrious brother, M. Amédée Thierry has given the name of *récits* (6), are certainly in the abstract admissible enough as helps to the understanding of the more obscure parts, perhaps of all parts, of history. M. Thierry has indeed been a little rash, and more than a little unlucky, in remarking of Gibbon that in him "on y sent trop le vide des détails, et les détails sont l'âme de l'histoire." It is quite true that under the conditions of Gibbon's work he is often compelled to be chary of details; but his glory as an historian is that the want of them is rarely felt, owing to the admirable selection of those which he does give and the masterly suggestiveness of his generalizations. Details are rather the body than the soul of history. But, however this may be, there was certainly room for M. Thierry's work. That work is perhaps scarcely remarkable for the vividness and picturesque composition which are required to justify it. Even with the aid of a great many "purple patches" from Claudian, these narratives are on the whole dull. Now we should imagine that a *récit* is bound above all things not to be dull.

It would require a skilful professor of classification to decide to what literary *genre* the papers which M. Karr has republished under the general title of *Pendant la pluie* (7) belong. They may, however, fairly be regarded as belonging to the class of desultory soul-deliverances to which veteran men of letters, especially when they have had much to do with periodical writing, often addict themselves. Sometime M. Karr goes "*pendant la pluie*" into his library, and takes up an old book and talks at the present generation by the aid thereof. Sometimes he wanders about Europe, and gives us his impressions of men and things. Sometimes, and rather often, he inveighs against modern feminine costume, laying it down as an eternal verity that high waists are the proper thing, which seems to be a little arbitrary. Then, as in his case is unavoidable, he becomes personal for a change, and assaults poor M. de Lacretelle for writing a book about *Lamartine et ses amis* without putting him—Alphonse Karr—among the friends. Elsewhere he recurs with pride to the days when he taught several mariners of Havre to build a cunning vessel which defeated the machinations of some abominable "coureurs anglais," who were wont to bring over preposterously slender boats and win all the regatta prizes. But, in truth, the subject of M. Karr's parable does not much matter, except when he becomes directly political, in which case it must be admitted that he is too often in the neighbourhood of the *genre ennuyeux*. The pleasant fashion in which he handles nearly all his subjects, and of which (it is lamentable to have to confess it) he and his now rare contemporaries do not seem to have taught the secret to the present generation of Frenchmen, save in a very few cases, is the element of attraction in these random studies. They are not merely pleasant to read *pendant la pluie* but *pendant le beau temps* as well, and, except the victims of M. Karr's wrath—nay, even including these, unless they be men of the thinnest of skins—everybody ought to enjoy their perusal.

The fifth volume of the works of the Cardinal de Retz in the edition of the "Grands écrivains" (8) contains the completion of the Memoirs, now edited for the first time critically, a large number of political pamphlets written by or attributed to the Cardinal, and the well-known *Conjuration de Fiesque*.

M. de Foville has produced, in a volume with a not very engaging title (9), a book of considerable interest to others besides mere statisticians. It contains a good deal of curious information

as to the methods and cost of locomotion, not only in France, but also in other countries. M. de Foville has subjoined some rather far-reaching speculations on the future of his subject, and its influence on social and political progress and well-being.

The earliest years of Napoleon Bonaparte have never yet received quite such careful consideration as that which M. Iung's two volumes (10)—to be apparently followed by others—devote to them. The author has diligently consulted the archives of the French War Office and other manuscript sources. His book has what is too rare in French historical studies—the distinction of being provided with maps, and he never mentions a proper name without giving some particulars, where any are known, about its owner and his family. The present volumes go as far as 1794, the author's announced intention being to carry his work down to 1799.

We do not think that M. Paul Bert has done himself much credit by his collection and publication of *La morale des Jésuites* (11). The characteristics of Jesuitical morality and casuistry are, or ought to be, known to every educated person, and most persons whose reading is pretty wide know the monstrous lengths to which the system of minute soul-inspection has been carried. M. Bert has collected together in a thick volume all the most scandalous passages he could find, accompanying them by occasional comments expressive of virtuous indignation. It is astonishing how prone virtuous indignation is to pitch upon just those subjects which it is much better to be silent about.

M. Croiset's essay on Pindar (12) is creditable to French scholarship, which, after an eclipse of considerable duration, has recently shown many signs of revival. The author handles his subject with a good deal of literary skill, and at the same time in a manner satisfactorily different from the superficial fluency which has too often characterized his countrymen's efforts on such subjects, and which he takes occasion obliquely to rebuke in Villemain, a most notorious offender in this kind. M. Croiset has laid out his task in a thoroughly scientific fashion. He begins with a short biographical and bibliographical notice, then deals at length with the general laws and character of Greek lyric poetry, and finally attacks the Odes themselves under such headings as "Gods and Heroes in Pindar," "Pindar on Human Destiny," "Personal Relations of the Poet," &c. The treatment is thus exhaustive in design, and in execution it can be well spoken of.

Should M. Legrelle further add to the bulk of his essay (13) it will certainly become one of the most voluminous essays known to bibliography. In its present form it extends to nearly a thousand closely printed royal octavo pages, and contains all the unpleasant facts that the author can get together about Germany and Germans. M. Legrelle is not satisfied with raking up all the stories he can find against the invaders for their actual conduct in the last war. His four chapters—imagination shudders at the idea of a chapter of two hundred and fifty huge pages—deal not only with this subject, but with the internal condition of Germany (Prussia, M. Legrelle prefers as a title), with the activity of the German race abroad, and with the probable future of Europe. The author is one of the most determined of pessimists, and the "Dieu sauve la France" with which he concludes is rather a melancholy prayer than an expression of cheerful confidence. It appears to him possible that England may be bribed to accept Dunkirk or Calais, Spain to take back Roussillon, Belgium to accept French Flanders, &c. But let no one suppose that M. Legrelle is sanguine as to the prosperity of countries other than his own. According to him, the existence of a German hospital at Dalston, supported to some extent by English subscriptions, the presence of Professor Max Müller at Oxford, and the ubiquity of German waiters, presage the speedy downfall of England, or at least many unpleasant consequences to us. In short, M. Legrelle is what the Scandinavians call a seer of ghosts by daylight.

M. Astruc's book (14), if it does not command a wide audience, will come opportunely enough to those Gentiles who desire to acquaint themselves with the present attitude of Judaism. His sermons, for the most part, are polemical against materialism, defend the monotheist principle, and maintain from the Talmud as well as the Scriptures the morality of Judaism. The book, like all M. Lemerre's publications, is attractively got up.

Profils intimes (15) is a record of interviewing, pure and simple; nor, to do it justice, does it pretend to be anything more. M. Marx has professionally visited a great many people, from George Sand to M. Jules Verne and from M. John Lemoinne to Mlle. Schneider, and he gives a faithful account of their conversation, their rooms, their coats, their hose, and their hats.

There is a good deal of sprightliness in M. Audebrand's *Petites comédies du boudoir* (16). They are, for the most part, very brief, and touch off various aspects of Parisian life cleverly, vividly, and in a spirit of satire which is not at all ill-humoured.

It would be difficult to find two accounts of travel over, in part, very nearly the same ground, made under more different circumstances than those recorded in the works of MM. d'Audiffret (17) and Simon Mayer (18). The former went to Japan because he had nothing better to do, and came away from it for the same reason. He has described his globe-trotting pleasantly enough, but with no very striking success. The chief note of M. d'Audiffret as a traveller seems, though he claims to be very *blasé*, to be an innocent kind of wonder, which is excited indifferently by the Bishop of Colombo's gaiters, by the frequency of English naval stations, by the heat in the Red Sea, and by the bigness of things in America. M. Simon Mayer, on the other hand, went to New Caledonia as a *Communard*, and his experiences, first laid before the readers of the *National*, are here gathered together. The jerky style of the book and its occasional tall talk (both resulting from a corrupt following of M. Victor Hugo) produce at first an unpleasant effect. The facts which the writer has to tell of his successive sufferings in the Toulon *bagne*, in the convict ship *Virginie*, and in the house of exile itself, are, however, of sufficient interest to fix the attention by degrees. It is indeed impossible to avoid mentally reminding M. Mayer that his presence in his unpleasant galley was altogether his own doing; but he seems to have made out, after every deduction, a fair case of unnecessary harshness against the authorities.

A perusal of *Daniel Rochat* (19) will perhaps not a little help to explain its ill success as an acted play. There are of course what Bailie Jarvis would call "glimmerings" in it, as there must almost of necessity be in any piece of M. Sardou's. The interesting young woman who expects to see Voltaire in the flesh—*un centénaire c'est intéressant*—the unlucky misunderstanding by which the pious zeal of a Protestant household against Roman Catholicism is mistaken for an indifference to religious ceremonies altogether, and the underplot of the loves of Casimir Fargis and Esther Henderson are redeeming features. But no one can contend that they save the piece as a whole. Whether the situation is one which could be treated dramatically, except in the style of high tragedy, is a question of abstract criticism with which fortunately we need not here trouble ourselves. It is sufficient to say that in *Daniel Rochat* it is not so treated, and that the piece is never in its present form likely to have a genuine success.

Two volumes of poetry (20), part of which will be familiar to students of the Parnassian school, express well enough different characteristics of that populous and not wholly uniform academy. M. Silvestre represents chiefly its earlier form, as shown in the original *Parnasse Contemporain* of 1866, and is deeply imbued with the spirit sometimes of Baudelaire, sometimes of De Banville. There is, indeed, in this volume no work of a later date than 1872. M. Aicard (21) has advanced into a further stage. His book is a romance of Provençal life told in loose narrative verse, with lyrical preludes, sometimes of considerable beauty. The narrative itself is, for French poetry, surprisingly pedestrian in style, and we should have liked the preludes better, we think, alone. The work, however, may be of some interest as indicating the tendency of a certain number of French poets, with M. Coppée at their head, to return to usual domestic interests as sufficient to furnish them with subjects, instead of courting the somewhat intense and exotic inspiration of the earlier Parnasse.

The literature of translation has been enriched by the first volume of a new prose version of *Orlando Furioso* (22), produced in M. Lemerre's dainty little series, and by the third volume of a meritorious rendering of Strabo (23).

M. Lemerre has conferred another favour upon the lovers of handy little books by reprinting in duodecimo M. Alphonse Daudet's charming *Le petit chose* (24). This work, suggested probably by the author's own experiences as an usher, is one of the best examples of his earlier and better style, before he made personal allusion and gossip the main attractions of his work. It is characteristic, however, that even here there are things of the kind, notably an ill-natured sketch which must be taken, whether it is meant or not, for M. Leconte de Lisle. There is at least no necessity for M. Daudet's readers to "bathe themselves in water and be unclean until the evening"—a regimen which Mr. Carlyle would infallibly prescribe to readers of M. Zola. That notorious author has at last succeeded in putting into the hands of his critics, in *Nana* (25), a final and complete proof of the badness of his literary method, whereby a novel is made into a *procès verbal*. There is no need to dwell on the objectionable character of the matter, because the book is damned irreparably by the badness of its form. The work of M. Ernest Daudet (26) and the anonymous *A côté du bonheur* (27) are examples, and, on the whole, very fair examples, of the ordinary French novel of the better class. M. Daudet, in particular, usually leans to virtue's side in his study of manners, without indulging unduly in the use of rose-pink. The steps whereby the younger members of the

Graville family are rescued from evil ways and directed into paths of peace are related in a sufficiently interesting manner. *Le mariage d'Odette* (28) is more ambitious, and deals with more perilous stuff. It is a novel with a purpose—the purpose being to show the danger of bringing up young ladies in habits of free thought, by means of the fortunes of Germaine and Odette Laviguerie, daughters of a *savant* of very advanced opinions. Everybody is rendered sufficiently miserable by Odette's want of self-control, and the moral, if rather painfully put, is also put forcibly. A strict critic, however, might point out to M. Delpit that the muddle by which the wrong man is made to marry the wrong woman, owing to Germaine's well-meant lack of outspokenness, is nearly as much responsible for the catastrophe as Odette's lack of moral elevation. *Miss Eva* (29) is a book full of characters and their conversation; we cannot say much more about it. The Baron de Nervo, whose other works seem to have been of a more serious class, has attempted in *Lucia* (30) a short romance of the pathetic kind. His success is not great, partly owing to his uncomfortable style, which abounds in such verbal jingles as "adorée, dévorée," "sinon un bonheur, du moins un honneur," and so forth. M. Lindau's volume of short tales (31) is, on the other hand, pleasantly enough written. Most of them, though not all, deal with China and other Eastern countries.

THE ELECTIONS.

THERE are 302 members returned for English and Welsh boroughs. All the English and Welsh boroughs have now returned their members, and the result is that 217 Liberals and 85 Conservatives sit for these constituencies. In the last Parliament the boroughs returned 158 Liberals and 144 Conservatives, so that there has been under this head a Liberal gain of 59. This figure is as nearly as possible that of the late Conservative majority, so that the English and Welsh boroughs may be said to have swept away the whole Conservative majority, and given an equal majority to their opponents. The Home Rulers may be reckoned at about 60, and thus, if everything had depended on the borough elections, the two great parties would each have had as nearly as possible 300 representatives, and the rest of the House would have consisted of Home Rulers. The Home Rulers would, it may be presumed, have joined in helping to turn the Conservatives out of office, and in ordinary cases they would probably have seldom or never voted in a body against the Liberals. Still it is easily conceivable that the Home Rulers might on some important division have carried their full strength into the opposite camp, and a Liberal Government might have been constantly harassed with the difficulty of keeping its followers sufficiently together to prevent the Conservatives, aided by a portion of the Home Rulers, from beating it on questions of minor importance. For such a Government to be really strong, it was necessary that enough seats should be gained in the counties and in Scotland to make any possible junction of Conservatives and Home Rulers of no moment. Up to the present time there have been gained sixteen seats in the counties and nine in Scotland, or twenty-five in all, counting fifty on a division. The Home Rulers are thus disposed of, and there are still some further possible gains for the Liberals in the counties and in Scotland. There is, too, a serious split among the Home Rulers, and it has become less likely than ever that they will act as a body. There is the party of Mr. SHAW, and the party of Mr. PARNELL, which are at open war with each other. Mr. PARNELL has few enemies whom he hates and defies more openly than Home Rulers who will not follow him blindly, and he has fought against his new foes with audacity and success. He has largely increased the numbers of his special band, and it seems probable that half the Home Rulers will now look to him to teach them at every step what to do. At Cork he has got himself returned, in spite of the strongest opposition on the part of the priests, and of local influence so strong that he owned that he would be content to secure the return of a Conservative so long as that most detestable of all beings, a sham Home Ruler—that is, a Home Ruler who will not submit to his dictation—was not returned. In the new Parliament Mr. SHAW, if re-elected, will not even nominally lead the Home Rulers. He will lead his group, and Mr. PARNELL will lead his group. The importance of the Home Rulers will thus be greatly diminished. The Parliamentary representatives of Ireland will be grouped under four heads. There will be the Conservatives, who may be roughly set down at 25; the Liberals, who may number 15; and 60 Home Rulers, divided not very unequally between the followers of Mr. SHAW and the band of Mr. PARNELL. England and Scotland may be expected to return about 325 Liberals and 225 Conservatives, giving a Liberal majority of 100. From this must be deducted 10, the number by which the Conservative Irish members will probably surpass the Liberal Irish members. The new Liberal Government will thus start with a majority of 90 over the Conservatives, and with the Home Rulers split into two hostile sections of nearly equal strength. If the Liberal leaders are capable of doing great things for their country, they certainly have now an admirable opportunity.

The Liberal gains in the counties have been small as compared with those in the boroughs, but they have been sufficient to show that those great Conservative strongholds could be attacked with a success sufficient to justify the attack. The Home counties have been true to their allegiance to Conservatism, and Mr. HERBERT GLADSTONE was easily defeated in Middlesex, although he won a great personal success by an unusual display of energy and eloquence. His delighted father has pronounced him to be a chip of the old block, and boasts that his son has accomplished the apparently impossible feat of speaking more in a given time than he himself has ever accomplished. Kent, Surrey, and Essex remain, so far as is yet known, true to their colours, although the personal popularity and local influence of Mr. WOOD nearly won him a triumph. The seat that haunts Sir THOMAS BUXTON's life, like the ghost of a possibility, has once more eluded his grasp. In the South and South-Western counties there have as yet been no Conservative losses. But in Wales, in Central England, and in the North the Liberals have had marked success. In Carmarthenshire, Pembrokeshire, Herefordshire, and Radnorshire there have been Liberal gains; and Mr. WATKIN WILLIAMS has wrested Carnarvonshire from the command of its chief landowner, by the astonishing majority of a thousand votes. In Central England Mr. HOWARD, as the representative of the Farmers' Alliance, heads the Bedfordshire poll, and furnishes a Liberal colleague to Lord TAVISTOCK. East Derbyshire, Huntingdonshire, South Leicestershire, Nottinghamshire, North and East Staffordshire, and South Warwickshire have given accessions to the Liberal strength; while in South Norfolk the difference of a single vote has displaced Mr. CLARE READ, who has been for fifteen years one of the ablest and most honest representatives of the Conservative agricultural interest in Parliament. In the North, two seats have been gained in Lancashire, and two in Yorkshire, while in Cumberland a Liberal gain in one division is balanced by a Conservative gain in the other—the solitary instance of a Conservative gain in a county after a contest. Mr. RATHBONE resigned a certain seat at Liverpool for the chance of opposing successfully Mr. CROSS and his colleague; but the result, which showed a great strength of Liberal voters, also showed that the seats of the Conservatives were never seriously endangered. It is impossible without an accurate knowledge of each constituency separately to pronounce any opinion on the causes of these Liberal successes. In Wales probably the success is rather that of Nonconformity than of rebellious farmers; and in the Northern counties especially, and in a less degree in such counties as Staffordshire and Derbyshire, it must be remembered that a portion of the voters quite sufficient to turn the scale are not agriculturists, but really belong to the borough population. Still the Liberal successes cannot be all accounted for in this way; and as in Herefordshire a Liberal tenant-farmer has been returned, while in Norfolk a Conservative tenant-farmer has

been defeated, and as in Bedfordshire the champion of the Farmers' Alliance has come in at the head of the poll, it is difficult not to believe that there has been some change in the sentiments of the farmers, which has expressed itself under the cover of the Ballot. And in reviewing the results in the counties, it is necessary to take into account those boroughs which are really small counties in themselves, such as East Retford, where there has been a Liberal gain, and Cricklade, where Professor MASKELYNE, who will be a very valuable accession to the new Parliament, actually polled double the number of votes that were given to his Conservative opponent.

Scotland has done all, and more than all, that she promised for the party which to her mind is led by Mr. GLADSTONE, and embodied in him. Four Conservatives have been returned for Scotch constituencies, and it is now by no means improbable that the Conservative Scotch members may fill the whole first-class compartment of which so much has been said. But out of the 60 Scotch members more than 50 will no doubt be Liberals. Dumfriesshire is regarded by the Scotch as a victory hardly less important than that of Midlothian, and Peeblesshire and Stirlingshire were won after some anxiety as to the result had been experienced. The Wigtown and Ayr boroughs have been detached from Conservatism, but the majorities by which at the last election Conservatives were returned were very slight, and there was little doubt that these boroughs would go over in the present state of Gladstonian enthusiasm. The efforts of the Conservatives in the Scotch boroughs which are recognized as permanently Liberal were so ludicrously unsuccessful as to involve the party which made them in some amount of ridicule, and to cause the inhabitants of these boroughs to rejoice greatly in the defeat in Buteshire of the supposed author of these useless contests. Some part of the Scotch Liberal triumph must be attributed to the action of the Ballot, especially in Midlothian, where Lord DALKEITH had every reason, so far as promises went, to expect a majority of 200, and where at least that number of his professing supporters must have gone over to his great rival. In England the most conspicuous instance of a disappointment of this kind seems to be Brighton, where two Liberals were elected, to the great surprise of their Conservative opponents. On both sides the representatives returned are, with some exceptions, of a better class than in the last Parliament, and that is conspicuously so with the Liberals. Whatever else the new Parliament may be, it will not be a stupid Parliament. In Liberal lawyers the new Government will be strong almost to the point of embarrassment. Since we last wrote, Mr. CHARLES RUSSELL, Mr. BUTT, and Mr. DAVEY have been added to the roll; and if there were suddenly a dozen vacancies on the bench, a Liberal Government could fill them up with credit to itself out of its Parliamentary supporters alone. An excess of legal strength may be a source of difficulty to the Government that commands it; but at any rate the new Government will start with an imposing array of lawyers devoted to its cause, with a majority of ninety, with an overpowering superiority of debating strength in the Commons, and with an enthusiastic confidence in its own ability, ingenuity, and wisdom.

THE FUTURE MINISTRY.

LORD BEACONSFIELD will probably follow the precedent which he was the first to establish by resigning office before Parliament meets. Although the new practice is reasonable and convenient, it affords one of many indications of a practical change in the Constitution. In the overthrow of Ministries the constituencies take the place which formerly was occupied by Parliament, and in earlier times by the Crown. The great political litigation which is now decided has been conducted before the same tribunal, to the great advantage of the party which was enabled to use the most plausible and popular arguments. It is a matter of regret that the representative system should have been weakened by the great increase of the electoral body; but there is no advantage in refusing to recognize accomplished revolutions or changes. As the suffrage is more widely extended the supremacy of Parliament will be still further impaired, and statesmen will have more and more occasion to struggle against the power of demagogues. It is doubtful whether the recent victory of the Liberal party has depended to any considerable extent on issues of national policy. Large numbers of former Liberals have joined the Conservatives, and there is no reason to think that there has been any movement in the opposite direction. In many constituencies the defeated Conservative candidates received more votes than in 1874; but the whole electoral body had in the interval been enormously increased, and the newcomers were almost all Liberals. If the election had been contested on the register of 1874, the result would perhaps have been the same as in that year. The old constituencies under the original Reform Act would have given the Conservatives a majority of two to one. The multitude has supported the party which offered the largest concessions to the popular craving for power. Disappointed Conservatives have been misled by the leaders of both parties, who with apparent reason assumed that the contest would turn on the foreign policy of the Government and its opponents.

The only difficulty in forming a new Government will arise from the number of claimants; but the same embarrassment has often occurred before; and it must be at once overcome. The chances seem to be against Mr. GLADSTONE'S acceptance of office, though his former colleagues would offer no opposition to any pretensions which he might advance. Lord HARTINGTON was probably not thinking of Mr. GLADSTONE when he lately announced that a moderate Liberal Government was the only Government possible. The elasticity of the term moderate will perhaps be illustrated by the selection of some members of the extreme party, who can scarcely be passed over; but the great majority of the new Ministers will be entitled to the name of Whigs, if that designation still survives. Lord GRANVILLE and Lord HARTINGTON, who will hold the highest rank, are not likely to profess revolutionary opinions. Mr. FORSTER and Mr. CHILDERS will not resort to measures which are now considered violent, though they will be eager for an extension of the franchise and for changes in the tenure of land which have but lately been urged on public attention. It is to be hoped that Mr. GOSCHEN'S bold and statesmanlike disapproval of uniformity of suffrage will not prevent the most accomplished financier of the party from taking office with his former colleagues. On such a question a solitary politician may, without loss of credit, defer to the almost unanimous opinion of the party. Mr. LOWE was never blamed for retaining his seat in the Cabinet which introduced the Ballot, though he must have profoundly disapproved of the greatest impulse which has yet been given to the progress of democratic power. He has now set an example which Mr. GOSCHEN may honourably follow, by declining any further to oppose a measure which is unanimously supported by his party. It would not be for the public benefit that puritanic scruples should disqualify for office conscientious and independent dissentients from some of the opinions of their party. Sir W. HARCOURT will for the first time have the opportunity of exhibiting in one of the great departments the industry to which he owes much of his Parliamentary success, and the administrative capacity which he probably possesses. During his tenure of office he will perhaps sometimes regret the happy days in which he could devote himself exclusively to the pleasant duties of ridicule and invective. The new Prime Minister will be neither so ungrateful nor so imprudent as to forget the claims of Mr. GRANT DUFF, who has both served long in subordinate office, and afforded valuable aid to the party by his zeal, his activity, and his inexhaustible stores of information. It would be absurd to expect that he would now resume a place of the same order with that which he held under Mr. GLADSTONE. It will scarcely be possible to pass over Sir CHARLES DILKE in the distribution of offices; and it is not altogether improbable that he may be offered the place of Secretary to the Lord Lieutenant. The appointment of Mr. FAWCETT to some considerable office would be generally approved. No member of the Liberal party has shown greater ability and industry, and on some questions his special knowledge is almost unrivalled. Mr. FAWCETT'S independence and political honesty may not be so peculiar to himself, but they form additional qualifications for office. Whether it will be thought practical or desirable to find room for Mr. CHAMBERLAIN is more doubtful. A Government which included two of the most advanced Radicals in the House of Commons could scarcely be described as exclusively moderate in its composition.

[illegible] appointments of particular offices to members of the Cabinet will, as in all such cases, be regulated partly by considerations of fitness, and to a great extent by the necessity of adjusting rival pretensions. Lord SELBORNE will of course be Chancellor, and it may be confidently expected that Lord NORTHBROOK will be Secretary for India, unless he should think it unadvisable to undertake the settlement of controversies in which he has taken an active part. No member of the Liberal party has had so great a variety of official experience; for he would be no stranger at the Treasury, at the Admiralty, or at the Home or Colonial Office. Lord KIMBERLEY's diplomatic experience points him out as the probable Foreign Secretary, for there would be conclusive objections to the return of Lord DERBY to the office which he held for many years as a member of the opposite party. There is no reason to doubt that he will accept the inevitable offer of some high post in the Cabinet. Lord CARNARVON, not having publicly announced his adhesion to the Liberal party, is probably not a candidate for office. There is reason to fear that Lord CARDWELL's health may prevent him from giving his former colleagues the aid of his long experience, of his good sense, and his moderation. If rumour is to be trusted, several of the former Liberal Ministers will retire on the present occasion. The Duke of ARGYLL, Lord ABERDARE, and Lord RIPON are not expected at present to return to office. If Sir HENRY JAMES resumes his former post of Attorney-General, Mr. HERSCHELL will probably be his colleague as Solicitor. As vacancies occur, Mr. CHITTY, Mr. HORACE DAVEY, and Mr. COHEN will relieve the Government from any difficulty as to Law Officers. The list which has been given is not exhaustive; but the general composition of the Cabinet is not doubtful.

It will not be pleasant to members who have lately spent thousands of pounds on their elections to be reminded that the Parliament may not improbably be dissolved in two or at most in three years. The extension of household suffrage to the counties and the consequent redistribution of seats can scarcely be deferred beyond the Session of next year. The extension or deterioration of the suffrage will meet with no effectual resistance in either House; for, even if the Government majority were insufficient, many Conservatives have trifled and tampered with a measure which will perhaps finally annihilate their party. The House of Lords will, with its customary prudence, abstain from opposing innovation when it is ascertained to be irresistible. A change which is as simple as it will probably be mischievous will be complicated by the more difficult task of creating new electoral districts. Many small boroughs which last week returned Liberals probably forgot that they were voting their own destruction. They have done their best to pull down the hedge which, in the cant phrase, kept out the man on the other side. It will be impossible to maintain the exclusive right of three or four hundred ratepayers to return a member when the adjacent county contains thirty times that number all in possession of the franchise. When it is too late the small boroughs and their members will protest in vain against democratic uniformity. With or without a complete system of redistribution, a County Franchise Bill will be passed in 1881; and, according to precedent, there ought to be a general election in the following autumn. The sovereign ratepayer will have a right to demand immediate enjoyment of his victory over disfranchised freeholders and tenant-farmers. The Radical section of the Liberal party will also insist on an appeal to the new constituencies, which may probably give them a large accession of strength. The experience of the late election will have satisfied them of the advantage which extreme Liberalism derives from the addition to the constituencies of large numbers of the poorer class of voters. The rural labourers will supply them with powerful reinforcements.

MR. GLADSTONE.

MR. GLADSTONE'S election for Midlothian might be plausibly described as an insignificant event. Notwithstanding the stress which has been laid on the Duke of BUCCLEUGH's territorial influence, Lord ROSEBERY's property in the county is as large as the DUKE's, and the constituency is in a large measure urban. In 1868 Lord DALKEITH was defeated by a larger majority in a contest with an ordinary candidate. A little Scotch county in which fewer than three thousand electors voted has, in reply to Mr. GLADSTONE's eloquent and prolonged appeals, returned him by a majority of 211. If there had been time for the faggot votes which the Liberal party were busily manufacturing to be placed on the register, the numbers would have been increased by two or three hundred. On the other side, it may be said with perfect truth that the Midlothian contest has attracted universal attention. Mr. GLADSTONE's original motive for selecting the county as the scene of his oratorical efforts has never been satisfactorily explained. Perhaps the Duke of BUCCLEUGH might have been spared the attack which has been directed against his local influence if he had not, after the return of the Plenipotentiaries from Berlin, presided at an entertainment given in their honour. Whatever may have been the motive which gave rise to the contest, it has been conducted, at least on one side, with extraordinary vigour. Mr. GLADSTONE is pleased to say in his address that it approached to the verge of bitterness. In the same sense the fountain of Marah might have been described as slightly bitter. Passionate vituperation, expressing a political enmity which is undoubtedly genuine, has never been more systematically employed. The expulsion from office of a Government which was denounced as the worst and wickedest known in modern times was the avowed object of a fortnight's declamation in the autumn, followed by an equal profusion of polemical oratory in the spring. Having accomplished his object, Mr. GLADSTONE announces his intention of discontinuing his incessant attacks. If he adheres to his purpose, the termination of his invectives will be a relief to readers of newspapers. It is not surprising that he parts from his defeated adversaries with a sneer. His hope that they will profit by reflection will probably be gratified, though they are more likely to reflect on the caprice of constituencies than on their own demerits.

If Midlothian is not the most important even of Scotch counties, the candidate who is now its representative is much the most considerable member of the party which he has led to victory. Lord ROSEBERY perhaps only expressed the prevailing Liberal sentiment when, forgetting the ordinary modesty of language, he assured an excited crowd that it was "a great night for Mid-"lothian, a great night for Scotland, a great night for "Great Britain, and a great night for the world." It might have been supposed that the enthusiastic orator had reached a climax; but Lord ROSEBERY proceeded to congratulate the 1579 electors on having as their member "the foremost man of Great Britain, the "greatest champion of liberty that now lives in the "world." Eulogies delivered in the presence of their object were formerly supposed to be subject to some of the restraints which limit the freedom of self-praise. Mr. GLADSTONE is undoubtedly one of the two foremost men of Great Britain, and he is the greatest champion of party that now lives in the world. He has won for the Liberals not only Midlothian, but many other Scotch seats; and the enormous majority by which he was returned for Leeds represents the success of his agitation in the populous districts of the North of England. He may probably consider as but a trifling drawback the alienation which his violence has produced among moderate Liberals of the upper and middle classes, who are in average constituencies only counted by hundreds. Westminster, the City of London, the metropolitan suburban counties, Liverpool, and East Cumberland are not powerful enough to turn the scale against the constituencies which follow Mr. GLADSTONE. Although the depression of trade and the large addition to the constituencies of voters of the humblest class would probably have placed the Conservatives at a disadvantage, it is not absolutely certain that the Government would have been defeated if Mr. GLADSTONE had been silent and inactive. He found abundance of arguments for less ingenious candidates, and by dint of incessant repetition he produced an impression that the Government had mismanaged domestic and foreign affairs. In the course of his long series of speeches he encouraged almost every aspiration for change which is entertained by any class of theorists. Sometimes he tampered with the foundations of landed property, or he disclosed his well-known leaning to universal suffrage. He flattered the envy and jealousy which is directed against the possessors of rank and of wealth. The enemies of the Scotch or the English Church found in his speeches intelligible intimations of his readiness to promote disestab-

lishment as soon as it takes the form of a popular demand. Menaces to existing institutions seldom fail to excite the sympathy of the multitude. It is significant that, even in a familiar speech to his friends and neighbours at Hawarden, after laying down his arms, he carefully holds up to popular odium the concentrated wealth of London, the luxury of Westminster, and the landed property of Middlesex.

Having almost single-handed overthrown Lord BEACONSFIELD, Mr. GLADSTONE has, according to the practice of the Constitution, a right to succeed him if he wishes to resume office. A large section of his adherents find it difficult to understand why his claims should be postponed to those of Liberal leaders who are less powerful and less popular. If the majorities which have carried the election could be consulted on the choice of a Minister, they would almost unanimously elect Mr. GLADSTONE; but a vote by ballot among Liberal members of the House of Commons might have an opposite result. Passion, impetuosity, and earnestness, which means a consciousness of being always in the right, command at a distance the confidence which they disturb when they are exhibited in closer political intercourse. A wanton declaration of hostility to a great and friendly Power wins the applause of an audience of partisans, while it provokes the surprise and distrust of responsible politicians. Scotch Radicals may probably agree with the doctrine that it is well to hear nothing of foreign politics; but a statesman who, during a long career, has taken little or no interest in international relations, fails to influence even his own supporters in Parliament when he indulges in chance enthusiasm for or against some foreign State. One considerable section of the House of Commons would prefer Mr. GLADSTONE to any other Minister, because he would give their policy a preponderance in the councils of the party. The dangers which might result from internal division would perhaps be regarded as less objectionable than the moderation against which Mr. GLADSTONE's presence would afford the fullest security. The rest of the Liberal party would hold that Mr. GLADSTONE's strongest claim to their confidence rested on his acknowledged skill in finance; but, on the whole, if they had the choice, they would dispense with the active services of the leader who has brought them into power.

The decision must rest with Mr. GLADSTONE himself. It is not known whether he has yet made up his mind to accept or to refuse an offer which will necessarily be made. It has been truly said that the QUEEN, with whom the formal selection rests, may, without infringement of constitutional propriety, take notice of Mr. GLADSTONE's late display of political influence, and apply to him as the most conspicuous member of the dominant party to form an Administration. It is not absolutely necessary, though it is usual, to ask the advice of the outgoing Minister in the preliminary nomination of his successor. In the present instance it is unlikely that the QUEEN should deviate from the ordinary course. She will almost certainly consult her Prime Minister, who on his part will not fail to give her sound and loyal advice. If Lord BEACONSFIELD were capable on such an occasion of preferring party interests to the advantage of the Sovereign and the country, he might perhaps be inclined to recommend an application to Mr. GLADSTONE; but there is no doubt that he will leave to the adverse party the responsibility of choosing both the actual and the conventional leader. Five years ago Mr. GLADSTONE addressed to Lord GRANVILLE, as his principal colleague, the resignation of his post as head of the party. Circumstances may perhaps justify the retractation of the surrender, but it has not been publicly revoked. To the other party Lord GRANVILLE is the official leader of the Liberals; and Lord BEACONSFIELD will not fail to recognize his position. If it is determined that Mr. GLADSTONE is to resume his place at the head of the party, Lord GRANVILLE will have the opportunity of advising the QUEEN to entrust the formation of a Ministry to the chosen leader of the majority. The personal selection of a Prime Minister by the Sovereign is in modern times practicable only when there is no candidate for the office possessing pre-eminent claims. WILLIAM IV. had no difficulty in appointing Lord MELBOURNE on the resignation of Lord GREY; but when her present MAJESTY, to avoid the necessity of choosing between two rival leaders, instructed Lord GRANVILLE to form a Ministry in 1859, Lord JOHN RUSSELL refused to serve under a Premier whose official rank and standing had been inferior to his own. The consequent selection of Lord PALMERSTON was probably a severe disappointment. In the present instance the leaders of the party will adjust their respective pretensions amicably, and the QUEEN will not withhold her sanction from the arrangement which may be proposed to her as most conducive to the public interest.

ARMENIA.

LORD SALISBURY once said in the House of Lords that it was impossible to instil common sense into the heads of the Turks. This was extremely true; but the Turks have their revenge, for they have had a very large share in the downfall of the Ministry of which Lord SALISBURY is a prominent member. The settlement of the Eastern Question adopted in 1878 was based, in a great degree, on the supposition that the heads of the Turks had been so broken or cracked that there must have been an opening for the introduction of something like common sense into them. But the Turks have gone on from bad to worse, from worse to as bad as can be. They have conceded nothing, reformed nothing, arranged nothing. They have even got past making promises. They do not play off the English AMBASSADOR at Constantinople against the Russian, or the Russian against the English. They entrench themselves in their obstinacy, and defy all Ambassadors alike. This has been a great disappointment to the English Government, and it is one that was very little deserved. For the Government would have been very ready to help Turkey, if Turkey would have given them the slightest chance of helping it with effect. It is obvious that, so far as the recent elections have turned on foreign policy, the Government would have been in a much better position if they could have pointed to reforms in Turkey, and insisted that a reformed Turkey would be a solid barrier against Russia; if they could have met the charge that they sided against the oppressed by showing that Turkey was no longer oppressive, and if they could have invited their critics to own that the model Government of Cyprus was in some way, however faint, being copied in Asia Minor. But nothing of the kind has been possible. At every point the Turks have cut away the ground under the English Ministry. They offer no barrier, even of the slightest kind, against any one. There is nothing to be found in Constantinople except jobbery, intrigue, and a palace which is the home of senseless extravagance, and which its wretched owner dare not leave; while Asia Minor is the deplorable scene of a misery that has passed the borders of starvation, and of a confusion that is scarcely distinguishable from anarchy. The Ministry has been far too honest to refuse to look plain facts in the face. Lord SALISBURY has publicly warned Turkey that its last chance seems to be rapidly fading away, and the English fleet has been sent into Turkish waters to restrain the Porte in one of its most outrageous defiances of decency. But the plain facts remain, and if Lord SALISBURY had continued in office, he would inevitably have had before long to confront the enormous difficulties which a Turkey going headlong to destruction must offer to every English statesman.

Of all instances of Turkish misrule, Armenia is at the present time by far the most important. Not that Armenia is peculiarly badly treated. There is, we may be sure, as nearly as possible the same state of things in the province next to Armenia as in Armenia itself. But Armenia stands in a very singular and exceptional position. One of the chief provisions of the treaty that ended the Crimean war, and one of the standing maxims of European statesmen, had been that all the Great Powers should be rigidly excluded from interfering in the internal affairs of Turkey. Russia, under a strained interpretation of an ancient treaty, claimed a right of protectorate over Orthodox Christians; but this claim was persistently and effectually resisted by the other Powers. In the Treaty of Berlin, however, a memorable departure was made from the old rule, and it was made in favour of Armenia. The Porte engaged to realize without delay the ameliorations and reforms which are demanded by the local wants of the provinces inhabited by the Armenians, and to guarantee their security against the Circassians and Kurds. It further engaged periodically to make known the measures taken to this

and to the Powers, "who will superintend the application of "them." This was to go very far in the authorization of interference. To promise reforms was nothing, to promise to communicate them was not much, but to give a treaty right to foreign Powers to superintend the application of reforms was a very great deal. Russia is conterminous with Armenia, Russia has a million of Armenian subjects, Russia includes the chief seat of the Armenian Church, Russia has got hold of the fortresses which place Armenia at her disposal, and now Russia has a treaty right to superintend the application of reforms in Armenia. Russia has not got to invent an Armenian question. She has had one invented for her, and she can raise it any day she pleases. There is no doubt that this provision of the Berlin Treaty was one of the concessions to Russia which the English Ministry thought it wise to make, in order to gain what were comparatively greater advantages in a general settlement. There is no reason whatever to blame the Ministry. On the contrary, it ought to be recognized that they took a very peculiar step in order to insure relief to the oppressed. But it cannot be supposed that they would have made a concession so gratifying to Russia, unless they had believed that it was not Russia, but England, into whose hands the task of superintending the promised reforms in Armenia would naturally fall. England was to guide Turkey into the path of reform. There would be, in the language of the Treaty, ameliorations and reforms throughout Asia Minor, and consequently in Armenia, and over these satisfactory processes England would watch like a good angel. Unhappily the Turks have disappointed the English Ministry in this as in everything else. Not only have they not themselves even begun to introduce any reforms in Armenia, but they have thwarted and baffled the English Ministry whenever it has tried to get such reforms started.

A description of the state of things now existing in Armenia has been recently given by a writer who signs himself "An Eastern Statesman," and who is by no means unfriendly to the Turks, but says a good word for them when he can honestly do so. He only corroborates and condenses the information given by travellers and by impartial correspondents writing for English journals of all shades of opinion. But at any rate he has the merit of putting his case shortly and plainly. The instruments used by the Government in the work of oppression are, he says, the Kurds, the Circassians, the army, the police, the courts of justice, the tax-gatherers, and the agrarian laws. It may seem to need explanation how both the Kurds and the army that is supposed to put down the Kurds can be made to work to the same end. It is managed in this way. After the Kurds have done a fair amount of ravishing and plundering, an army is sent into the country. The Kurds retire into the hills, and the army does them no harm, letting them carry off all their plunder except that portion which they give by agreement to the Turkish pashas. The army then collects from those whom it comes to save the whole tax of the province, including the portion which ought to have been paid by the Kurds. The army then goes away, and leaves behind it a local militia composed of Turks and Kurds, which collects some more taxes, those collected by the army being treated as supplementary or exceptional, and not allowed to count in favour of those who have paid them. Then the Kurd robbers come again in a formal manner, and take possession of the province until another army comes, and then the process begins again. It must be owned that the writer does not explain how, under such a state of things, there can be anything left for robbers to steal or extort, or for corrupt courts of justice to give to the wrong man. It appears that, according to their own statements, the Armenians are being gradually exterminated; but the bulk of the people are just able to avoid actually dying. At one time the Porte did defer so far to the instances of the English Ministry that it promised to introduce the first and best of all reforms into Armenia by establishing a decent gendarmerie, with European officers. The gendarmerie remained wholly in the clouds, but some officers were appointed. They were never, however, allowed to leave Constantinople, and after a short time their pay was stopped. So far as Turkey goes there is not a ray of light for the Armenians; but they have unquestionably a clear provision of the Treaty of Berlin as a beacon of hope. Who will enforce this provision, and when, and how far it will be enforced, may be altogether uncertain; but the fact that it has been ostentatiously infringed, and will some day be enforced, is a matter that must command the serious attention of Lord SALISBURY's successor, as it has commanded that of Lord SALISBURY himself.

CONTINENTAL OPINION ON THE ENGLISH ELECTIONS.

WITH the exception of the Russian press, and of two or three French papers, Continental journals express unanimous regret at the fall of the Conservative Ministry in England. Foreign politicians had not waited for the event to publish their opinions; but they have no means of reaching the masses of voters who decide the election. In London, indeed, and in Sheffield strong and well-founded jealousy of Russian designs has induced a large part of the population to appreciate the common interests of England and of civilized Europe. In the majority of constituencies the suppression of the Established Church or of the sale of beer occupies a much larger share of public attention than the maintenance of English dominion in Asia or of peace in Europe. The explanations which Mr. GLADSTONE and Lord HARTINGTON supplied of the sympathy for Lord BEACONSFIELD's Government which prevails on the Continent were probably deemed more than sufficient. It was suggested that French, German, and Austrian writers consulted the respective interests of their own countries, which might be antagonistic to a sound English policy. Mr. GLADSTONE took occasion to quote a declamatory assertion of Lord JOHN RUSSELL's in 1850, that Lord PALMERSTON was not the Minister of France, Austria, Prussia, or Russia, but the Minister of England. The House of Commons applauded the patriotic antithesis; but as soon as the debate was over, Lord JOHN RUSSELL addressed to Lord PALMERSTON a peremptory reproof; and in the following year on the same ground he dismissed him from office. Mr. GLADSTONE himself joined in the censure on Lord PALMERSTON which the House of Commons declined to pass. The present insinuation is, if Mr. GLADSTONE's sneers have any meaning, that Lord BEACONSFIELD has thwarted Russia, not on grounds of English policy, but for the benefit of Germany or Austria. Mr. GLADSTONE himself can scarcely, notwithstanding his habitual ignorance of foreign affairs, believe in the accusation which he hints; but he thinks it good enough for an applauding Midlothian crowd. Lord HARTINGTON with more moderation confined himself to the remark that foreign Powers probably wished well to the English Ministry because they thought it likely to serve their purposes.

Continental statesmen are quite right in regarding English policy as it tends to clash or coincide with their own. The value of their present approval depends, not on opinions of interested foreigners, but on the expediency for English purposes of common action. Germany, Austria, and even Italy wish to preserve peace, which is only possible during the suspension of Russian schemes of aggrandizement. The policy of France is equally pacific; and it is there well known that Lord BEACONSFIELD's Government would have discouraged to the utmost any combination of the central European Powers against the French Republic. If a landowner is liked and respected by his neighbours because he is neither litigiously disposed himself nor tolerant of encroachments on the property of others, it is no imputation on his character that his neighbours wish him well rather for the sake of their own comfort and convenience than from disinterested attachment. The character and tendency which foreign politicians attribute to Lord BEACONSFIELD's Cabinet are those which ought to belong to a prudent and patriotic Government. The evidence furnished by the Russian press strongly confirms the conclusions of European opinion. The progress of the elections has been watched in St. Petersburg and Moscow with undisguised satisfaction, because a change of Ministry is there expected to produce the same results which excite uneasiness in Vienna, Berlin, and Paris. Mr. GLADSTONE's wanton denunciation of Austria is especially welcome to the Slavonic party, because the progress of Russia in the Balkan peninsula is mainly checked by the Austrian occupation of Bosnia and Herzegovina. As one result of the English elections, the Russian press has commenced a fresh agitation against Austria. Against the distrust of Liberal policy which is felt by other Continental Powers, and the interested good will of Russia, Mr.

GLADSTONE proposes to set off the supposed confidence of the Southern Slavs, and perhaps of the Austrian subjects with whom the revolutionists of Italy desire to effect political union. An alliance with discontented populations is a defiance of the Governments to which they are actually subject. Mr. GLADSTONE's sympathy with Bulgarian and Macedonian Christians offers direct encouragement to Russia. In some of his speeches he has even gone out of his way to distinguish the Slavonic inhabitants of the Austrian dominions from the Magyars and the Germans. He probably meant less than he said; but the Governments which he attacks cannot be expected to inquire how far he is in earnest. In the probable contingency of Mr. GLADSTONE's refusing office, much of the distrust which is at present felt will disappear. Lord GRANVILLE is not likely to found a policy either on philanthropic sentiment or on gratuitous national antipathies. The worst that is likely to happen under his administration would be the practical withdrawal of England from the European concert.

Almost all Continental critics naturally exaggerate the influence which foreign affairs have exercised in the late elections. The verdict of the numerical majority has been given in favour of the supremacy of numbers; or, in other words, of democracy. The result has shown the electoral weakness of the moderate Liberals, who may nevertheless in almost every constituency be counted by hundreds of the most intelligent and thoughtful class. The time has not arrived when the best intellects of the country will be forced to retire, as in the United States and the Australian colonies, from public life; but on no previous occasion has cultivated opinion been more generally overruled. It is true that the new House of Commons will not be inferior to the last in the social position or in the average ability of its members, and that the Stoke election of 1874 was as discreditable as the Northampton election of 1880; but the spirit of Parliament will have been largely modified. It was not without significance that Mr. GLADSTONE in one of his latest Scotch speeches protested against deference to the opinions of peers, of the landed gentry, of the rich, and in general of those who are commonly called the upper classes. The Jacobinical French journalists perhaps appreciate more justly than other foreign writers the real meaning and tendency of the reaction which has taken so many observers by surprise. The shaft which was sunk down to a new stratum in 1867 was supposed, after the failure of the experiment in the following year, to have satisfied at the last election the expectations of the undertakers. The formation has now been more decisively tested; and if any doubt of its quality remained, the managers of the work are immediately about to sink deeper still. One of the causes which will diminish the attention of England to European interests is the probable agitation for various domestic changes. Mr. LOWE's cynical threat that the next Liberal Government would harass more interests than the last was probably prophetic, though it was scarcely prudent. It unfortunately happens that political power is in the hands of those who have no tangible interests to be harassed by legislation.

The impending change of Ministry may not improbably affect the projects of the Russian Government in Central Asia. The reports which have for some time been spread of the abandonment or postponement of the expedition to Merv may have been intended only to lull suspicion; and the appointment of General SKOBELEFF to the command of the army which is to attack the Turkomans seems to indicate a vigorous campaign. A belief that no effort would be made to counteract Russian designs in Northern Afghanistan might perhaps encourage ambitious designs. The movements of ABDURRAHMAN may not improbably have been concerted with his recent protectors, though he will of course regulate his conduct with exclusive regard to his own interests. Lord HARTINGTON was not well advised in stating that the policy of a Government in which he must hold a principal place would be to evacuate Afghanistan as soon as possible; and he has since partially explained away phrases which had not perhaps been sufficiently considered. Early evacuation may possibly be judicious, but it would not be prudent to inform friends and enemies that they have nothing to hope or to fear. Lord HARTINGTON professed to believe that the present Government was not disinclined to the same policy, but he is not in the secrets of the Cabinet. The only interest of Continental Powers in the affairs of Afghanistan or Central Asia is founded on a desire that England and Russia should continue to be rivals, if not enemies. They may perhaps overrate the indifference of Liberal statesmen to the risk of Russian aggression. Lord NORTHBROOK, who will probably have much influence over the Indian policy of the next Cabinet, was seven years ago not indisposed to guarantee the Ameer of AFGHANISTAN against Russian hostility; and the events which have since occurred can scarcely have diminished the jealousy with which Russian encroachment is regarded. All the calculations, both of Russian sympathizers and of unfriendly critics of Liberal policy in other Continental countries, depend on a doubtful assumption. Until it is known whether Mr. GLADSTONE takes office it is useless to speculate on the policy of the Government. Though he has done more than all his political colleagues to achieve a great party triumph, some of his principles and theories are peculiar to himself. No other Liberal Minister has announced that foreign affairs should never be heard of, or that Austria is excluded from English sympathy. His personal eccentricities will be important or indifferent as he takes the lead in the Government or stands apart. The secret will soon be disclosed, and in the meantime foreign critics will do well to suspend their judgment.

ENGLISH FARMING AND AMERICAN MEAT.

THE statistics of meat production in the United States which appeared in the *Times* of Tuesday have an extraordinary interest for farmers at the present moment. Large numbers of them are probably considering whether they can go on paying the rent and the wages they at present pay, and farming the land as they at present farm it. Six months ago they had pretty well made up their minds that a change must be made somewhere. More money must be got out of the land or less money sunk in it. But good weather, with the prospects it suggests of good crops and good pasture, may have once more made them hopeful. Last year they had to face American competition under cruel disadvantages. Now that the seasons once more follow their normal rule, and March winds have been properly succeeded by April showers, even American competition may not look quite so formidable. If this is the opinion they come to after careful study of all the evidence they can get, they will of course have a just right to their conclusions; but it will be tempting disaster if they jump at such an opinion without this previous study.

The first fact which the writer in the *Times* mentions is the very curious one that compulsory slaughter at the port of landing has not had the effect which was attributed to it by the Opposition when the Animals' Diseases Act was under discussion. It was generally predicted that the enactment of this provision would greatly discourage the importation of cattle. Even those who defended compulsory slaughter in the interest of the consumer hardly ventured to question this result. They contented themselves with pointing out that it was better to check importation, even if we thereby lost our foreign meat supply, than to leave importation free and lose our home meat supply. Had the advocates of the restriction been prophets, they might have taken a much bolder tone. If they had denied the existence of the alleged danger, they would have been well within the mark. Instead of the importation of meat having been discouraged, it has apparently been greatly encouraged. Since 1877 the imports of live animals have increased 80 per cent. Notwithstanding the undoubted inconvenience to which the trade is subjected by the present regulation, it has nearly doubled itself in three years. That is a circumstance which farmers will do well to weigh in its political as well as in its economical aspect. Every addition that is made to the cattle imported into Great Britain and Ireland is a diminution from the force of the argument in favour of stringent restrictions upon importation. So long as the consumer depends upon home-grown meat for all but a scarcely appreciable fraction of his total supply, it is to his interest, as well as to the farmer's, to make any sacrifice to keep out disease. But, supposing that half or a third of the meat supply came from abroad, it is quite possible that the consumer's interest would then be best consulted by admitting foreign cattle freely. The risk to the home supply involved

In admission might be less important than the risk to the foreign supply involved in exclusion. It is too soon as yet to predict how soon the foreign supply will grow to these large proportions; but it is scarcely doubtful that we are now witnessing the mere beginnings of a process which contains within itself immense possibilities of increase. The stock of oxen and other cattle, excluding milk-cows, in the United States is twenty-two millions, and it increases at the rate of a million annually. This is while the export of cattle to England does not exceed thirty thousand in a year; and it is not difficult to conceive the effect which a large and rapid increase in the English demand will exert upon the American supply. The quality of the cattle in the United States is steadily improving. Every year "numbers of well-descended, usually pure bred "Shorthorn or Hereford bulls are purchased from Kentucky or the more Eastern States," and on well-managed runs more and more attention is paid to the selection alike of sires and dams. The grazing grounds on which these herds are pastured are of vast extent, and only a small part of them have as yet been occupied or even surveyed. With these facilities and the inducements afforded by the English demand, it is not wonderful that "the cattle throughout "America are increasing considerably faster than the "population, and there is an annually augmenting surplus "for exportation."

As yet the farmers' best friends are the shipping and dock Companies. The freights for the present year are about 20 per cent. higher than they were last year, and the charges for landing, lairage, and slaughtering seem in some cases to be exorbitant. It is stated that at the Victoria Docks 10*s*. 6*d*. an hour is charged for all work done after 6 P.M., even by the shipper's own men. It costs something like twelve times as much to land cattle at these docks as it does to land them at Gravesend. It is impossible, however, that these charges should be maintained permanently. It is a serious matter, no doubt, to build new docks, but as soon as it comes to be understood that large profits are to be made by it, fresh capital will find its way into this kind of enterprise. A more serious obstacle to the growth of the trade is the high price at which meat continues to be sold in butchers' shops. Whether this is owing to combination among butchers or to the cost of carriage, we will not undertake to decide. Indeed nothing but the opening of retail shops for the exclusive sale of foreign meat can bring this question to the test. If it is true that the American exporters intend shortly to set up shops of their own, at which meat as good in quality as most of that now sold in butchers' shops will be to be had at little more than half the price which the butchers ask, it will soon be known to whom the public must attribute the lightening of their purses which has so long been going on.

Nor is the trade in live meat the only rival which the English farmer has to fear. Nothing could well be less inviting than the tinned meats which some years back were introduced into this country. "Australian mutton" threatened for a time to become an equivalent for all that was least satisfactory in human food. As the methods of preparation have improved, the importation into England has increased, until the writer in the *Times* declares that "any one who has watched the clean and "careful manner in which the wholesome meat is "handled and put up foresees that the prejudice "with which American meat is still sometimes regarded "must speedily disappear." One firm alone at Chicago put up daily from 40,000 to 50,000 cans of beef, "carefully "and cleanly cooked in tins made on the premises"; while another Company slaughtered 80,000 beasts between July and November last year. Another formidable form of competition is to be seen in the trade in fresh meat. This is brought over in refrigerating chambers kept at a uniform temperature of 34 to 38 degrees, and is landed in good condition. The difficulty in this case is the rapidity with which the meat must be disposed of after its arrival. The appearance of a few hundred additional carcases in the market runs down the price, and during the last six months superior American beef has repeatedly been sold at 4½*d*. per lb. This involves a loss to the shipper which he is not likely to tempt by rashly enlarging his consignments. Still the writer in the *Times* does not estimate the superiority of home-grown over American meat at more than 1*d*. per lb.; so that, as already the latter can be sold at 6*d*. per lb. and yield a good profit to the exporter, the British farmer must prepare himself to produce meat which shall sell at 7*d*. per lb. This is excellent news for the consumer, though we fear that it will carry dismay to a class which has of late had to endure an extraordinary share of discouragement and disaster.

PRINCE NAPOLEON AND THE REPUBLIC.

THE decrees against the Religious Orders have gained the embarrassing support of Prince NAPOLEON. From the Bonapartist point of view he sees in them nothing objectionable. They come in part from a source which is above suspicion—the First Empire; and, if they can also be traced to the first Republic, hatred of the giver is not an adequate reason for rejecting a gift which is in itself good. The Concordat, Prince NAPOLEON thinks, has been too much forgotten, and if the blessings he attributes to it had really flowed from this source, his doxology would be justified. Religious peace, the most precious of goods, liberty of conscience, the most sacred of rights, can alike, he thinks, be traced to the beneficent hand of NAPOLEON I. It is sad to find that this "charter of pacification" is threatened on two sides. There are those for whom an oppressive and intolerant State religion still has charms. They would like to reproduce the pre-Revolution Church, just as they would like to reproduce the pre-Revolution monarchy. There are others who wish to see society organized on a basis which shall exclude the ideas of GOD and of a moral law. They would like to revive the religious madness of 1793, just as they would like to revive its political madness. Between these two extremes Prince NAPOLEON takes his stand. Come one, come all, he will not desert this post. If wild Republicans demand the separation of Church and State, and ask to be given the delightful spectacle of closed churches and a starving clergy, Prince NAPOLEON will oppose them. If wild Royalists set themselves against any one of the principles consecrated by the Revolution, Prince NAPOLEON will defend that principle. The weak point in the PRINCE's letter is that it seems to suggest alike to the authors and to the opponents of the decrees the answer—Thank you for nothing. M. DE FREYCINET is probably quite as ready to take his stand between opposing extremes as Prince NAPOLEON himself. He has no more intention of suppressing the budget of public worship than he has of re-endowing the Church with her confiscated estates. In point of fact, Prince NAPOLEON and the Left which looks to M. GAMBETTA, as distinct from the Left which adores M. CLÉMENCEAU, want exactly the same thing. They might not express it in quite the same phrases—we do not remember at least that M. GAMBETTA has ever expressed any horror at the prospect of a society without GOD—but when their wishes and intentions come to be reckoned up they are pretty well identical. They both desire a Church that will hold her tongue and mind her own business, and from this point of view the religious orders are especially distasteful to them. The parish priests are in the pay of the State, and though this circumstance does not moderate their language about things temporal as much as it might, it has a good deal of effect on them in the long run. The bishops are more independent, but there are not very many of them, and they have few direct means of getting at the laity. The religious orders are neither paid nor controlled by the State, and, through the part they play in education, they have very direct opportunities of getting at the laity. Consequently, the Ministerial Left and the Imperialist Pretender are equally anxious to maintain the principle which subordinates the existence of religious orders to the authorization and surveillance of the civil power. They may be permitted to exist, but only so long and so far as the civil power knows and approves of what they are doing. Neither the Republicanism which now rules France, nor the Imperialism which lies in wait to replace it, has any genuine conception of what liberty means. A certain measure of freedom is necessary to the citizen's happiness, and this measure, whatever it is, ought to be secured to him by the State. But he must learn to regard it as a gift from the Government, just as he regards a police force or a system of roads. That there can be any region in which the Government has no place seems never to occur to French politicians of this type. The State must do everything for the citizen, and, in return for this advantage, the citizen must surrender the right of doing anything for himself. At all events, he must not use this right except under State supervision. A religious order

—provided it is not the Jesuits—may submit its statutes to the civil authorities, and receive from them a sort of secular consecration; but it must not presume to live without this consecration. To allow it to do so would be to place the State at the feet of the Theocracy.

In some respects Prince NAPOLEON is better qualified than the Republican Government to offer this compromise to the Church. The Empire has more to give the Church than the Republican Government. The latter leans upon a body of opinion which is definitely anti-religious; the former leans upon a body of opinion which is simply irreligious. If M. GAMBETTA or M. DE FREYCINET were now to make a speech to their constituents, they would hardly find it expedient to denounce an organization of society which dispenses with GOD and a moral law. A considerable number of their hearers would be quite prepared to dispense with either or both. Prince NAPOLEON'S followers, on the other hand, are willing, and even anxious, to retain the ideas of GOD and of a moral law. They may not care much for them in themselves, but they value them for the ideas which are associated with them. Man is so constituted that sentimental sanctions of some kind are needed for the security of property. This difference between the two parties is seen in their respective ways of dealing with the Church. Both wish to keep the Church submissive; but the Bonapartists are quite ready to do this by civil words and substantial services; whereas the Republican Government prefer to do it by threats of the worse evils which will come upon the Church if she is not submissive. The choice of this latter method is not determined by the taste of the Republican leaders. It is probable that M. GAMBETTA, it is certain that M. DE FREYCINET, would prefer to follow the example of the Bonapartists if it were not for the obstinacy of their supporters. They are practical politicians, and they know how much is gained by civility. But they have to deal with men who, of the two, would rather see the Church insulted than injured; not of course that they object to the injury, but that the insult is so much more dear to them. It is difficult for the leaders of a party animated by these wishes to keep on commonly decent terms with the Church. To do so they must be prepared to restrain the ardour of the extreme section of their followers, and it is only by leaving this ardour to find its natural expression that they can hope to secure a majority in favour of giving the priests their incomes and maintaining the fabrics of the churches. In theory, religion has a claim to be protected against outrage, but it would be scarcely possible for M. DE FREYCINET'S Government to prosecute the amiable enthusiasts who celebrate Good Friday by blasphemous profanities which we prefer not to quote, or the sportive villagers who get up mock processions of the viaticum to a sick person. It is by maintaining a judicious blindness to such demonstrations as these that M. DE FREYCINET and his colleagues are able to avoid abolishing religious orders altogether and leaving the clergy to support themselves. The Bonapartists are under no difficulty on this head. Where religion is concerned they wish to be secular, but respectable; to keep the Church strictly under the control of the civil power, but to pay it a proper amount of external deference while it remains under that control. Even Prince NAPOLEON himself, since he has been chief of the party, has frankly come round to this view. There was a time when he himself was not immaculate as regards Good Friday; but he has now explained that, when he went to dine on that day with a few literary friends, he had forgotten what day it was. The Princess CLOTILDE keeps all Fridays so strictly that he had lost the faculty of distinguishing between one Friday and another.

For the moment, no doubt, the PRINCE'S letter seems a mistake. The Conservatives denounce it, because it is anti-clerical; the Republicans denounce it, because it is the letter of an avowed Pretender; the Bonapartists dislike it, because it makes a breach between them and the men with whom they have till lately been acting. It does not follow, however, that the letter is really a blunder. The great difficulty for the Bonapartists at this moment is to find a reason for existing. The Republicans can beat them from the point of view of the principles of 1789, the Royalists can beat them from the point of view of a settled hereditary Government. Prince NAPOLEON'S letter is addressed to that large section of Frenchmen which, though it has accepted the Republic, is still afraid of it, and would like to be assured that, if the Republic proves to be revolutionary, there will be a Government to be had which can be Conservative without being reactionary. If M. DUFAURE were at the head of affairs, this section would be much less fearful of the future than it is. But if M. DUFAURE had been Minister, there would have been no attack upon the religious orders, and to Conservatives of this particular shade an attack upon the religious orders, provided it is not pushed too far, is by no means disagreeable. It is far from unlikely, therefore, that Prince NAPOLEON judges his own interests more accurately than the Bonapartist journalists, and that in the long run his letter may prove to have done him real service. If the Republic were genuinely Conservative or genuinely Liberal, the offers of a Bonapartist Pretender would have but a small chance of being listened to. But a Republic which is neither Conservative nor Liberal, which neither protects the Church on the one hand nor leaves it free on the other, is exceedingly likely, as time goes on, to make enemies all round. When these enemies begin to realize how numerous they are, they may find in Prince NAPOLEON a leader under whom men of very different views may conveniently agree to differ.

SHOPS AND STORES.

THE great controversy of Shops v. Co-operative Stores has played a large part in the elections which are now nearly over. The keenness of the political antagonism excited by the struggle has thrown into the background such side issues as the wrongs of the Claimant and the sacred duty of letting children catch the small-pox. Even Local Option has been remarkable rather for the enmity it aroused in the publicans than for the devotion of its own friends. The detestation of Co-operation which burns in the breast of every shopkeeper worthy of the name found, therefore, a comparatively clear field. Next to the licensed victuallers—in some constituencies scarcely next to them—the retail tradesmen have been loudest in their enumeration of their wrongs, and in their appeal for redress. Unlike the publicans, however, their love and their trade seem to have been about equally distributed between the rival political parties. In Westminster, in which, as the home of several of the chief Stores, the controversy raged most fiercely, the war of placards was for a long time equally balanced. The retail shopkeeper was alternately implored not to be humbugged by the Tories or taken in by the Radicals; and it was only when the tradesmen discovered that one of the candidates had furnished his house from a Co-operative Store that either side seemed to have the advantage. It does not appear that Sir STAFFORD NORTHCOTE'S timely discovery that the Stores ought to pay Income-tax had much weight with the traders. Perhaps they thought that it would have deserved more gratitude if it had come a little sooner. Concessions made on the eve of an election are sometimes suspected even by those who profit by them.

There is a curious discrepancy between the enthusiasm which the tradesmen throw into their demand and the smallness, to judge by its probable results, of the demand itself. However angry they may be with Co-operative Stores, they have never suggested that it should be made illegal either to set them up or to deal at them. The only thing they insist on is that the Civil servants of the Crown should have no share in their management. Their grievance is that the taxes which they pay go in part to feed the destroyers of their peace. Secretaries and chief clerks, colonels and lieutenant-generals, post-captains and commanders, all live on the national exchequer during business hours, and then go off to the Stores to earn money in their hours of leisure. The shopkeepers have never yet answered the argument that the Government prescribes the hours during which its work is to be done, and that when these hours are over the time of the workers is their own. Perhaps they feel that the country is somehow defrauded when a Civil servant is discovered out of whom some more work might be got. Perhaps they do not care whether much or little is got out of them provided that their leisure is not spent in this particular way. At all events, it is only in the direction of Co-operative Stores that the tradesmen show any inclination to pry into the occupation of Civil servants after office hours. They may write for the newspapers, or become directors of joint stock Companies, or defraud the public of their time be-

fore breakfast or after dinner in any way that pleases them. It is only when their occupation takes the shape of a Co-operative Store and interferes with the sacred rights of the retail shopkeeper that the latter seriously bethinks himself what to do. He does not see apparently that the force of his argument is somewhat weakened by his long acquiescence in these sinful practices. He ought to have been on the watch for the first sign of a disposition on the part of the Civil servant to make money by serving other masters than the public. Then perhaps the great principle might have been established that the Government has a right to the idleness as well as to the industry of its servants, and that a clerk's work is never done. As it is, it is not an easy matter for a Government to issue any general order against Civil servants taking part in the management of a Co-operative Store. It is possible, no doubt, to make some such stipulation in cases of promotion. The head of a department may, if he chooses, assume that the duties of the post to which a clerk is about to be moved are incompatible with this or that other employment; and, acting on this assumption, he may make appointment to the one conditional on his surrender of the other. But it is only very occasionally that this opportunity occurs; and we should not envy the Minister who undertook to justify in the House of Commons a Minute forbidding Civil servants or officers in the army or navy to be directors of Co-operative Stores. Yet, unless some such Minute can be got out of the Government, the labour of the shopkeepers will go for nought. That is the only concession which it is in the power of a Government to make to them, and until the order actually appears, it is hard to believe that there is any likelihood of this concession being made.

There is one ground indeed on which the appearance of such an order would be very welcome. Nothing else, probably, will convince the tradesmen how little this particular change would do for them. If every Civil servant who is concerned in the management of Co-operative Stores were forced to abandon the work to-morrow, it would make no perceptible difference in their prosperity. An advertisement would appear in the newspapers convening a special general meeting of the shareholders for the purpose of electing directors in the room of Messrs. So-and-so, who had resigned. There would be no difficulty in filling their places—there never is any difficulty in finding directors for anything under the sun; and when once the election was over, the Stores would go on just as before. It is really astonishing that so many presumably shrewd persons should be so completely in the dark as to the causes which make Co-operative Stores successful. That success has nothing to do with the names by which they are known, or with the fact that some of their directors are in the service of the Crown. Customers go to them because they sell good articles at lower prices than are charged for them in most shops, and so long as they continue to do this, customers will continue to go to them. There is nothing in the least mysterious or underhand about their prosperity. Where shops are carried on upon similar principles they are equally prosperous. What the tradesmen do not see is that it is not possible for more than a comparatively small number of distributing agencies to be prosperous, whether they are called shops or Co-operative Stores. If a large shop of the kind which is now so general had been set up in the place of every Co-operative Store, the injury done to the small tradesmen in the neighbourhood would have been of the same kind as that done by the Store. A trader with a large capital and large appliances for business can afford to sell his goods cheaper than a trader with a small capital and small appliances for business. Or, rather, what seem like large appliances are really small in comparison with the business that is done by them. A shopkeeper who employs a hundred carts to carry out his goods may deliver as many parcels as twenty shopkeepers employing ten carts each. He seems to be spending a great deal of money on carriage, and yet all the time he is only spending half what his twenty neighbours must spend if they want to execute the same number of orders. The same reasoning applies with still greater force to rent and servants, and the conclusion to which it points is that, when once distribution on a large scale is organized, distribution on a small scale must come to an end, except where it can offer special advantages to the purchaser. In some trades these special advantages can be offered, and then the tradesman will have no cause to dread the competition either of larger shopkeepers or of Co-operative Stores. In others they cannot be offered, or, if offered, are not tempting enough to make it worth any one's while to accept them, when the higher prices which accompany acceptance is taken into account; and then the tradesmen will be gradually but surely distanced alike by larger shops and by Co-operative Stores. This is the common sense of the whole controversy, and in the end it may be hoped that the shopkeepers will have the wit to see it. That their case is a hard one cannot be denied; but, like other hard cases, it will not be made less hard by threats of making themselves a nuisance at every election.

THE USES OF ASSERTION.

IT would be premature at the present moment to attempt to draw all the lessons which may and should be learnt from the late extraordinary revolution in the constituencies. That it is an extraordinary revolution, and withal an all but complete surprise, hardly those who have profited by it attempt to deny. It was indeed, we are aware, well known beforehand to Sir William Harcourt, but this is rather a deduction from than a confirmation of the fact of Sir William Harcourt's omniscience. Most other persons of all shades of politics admit that their previous opinions, if only in degree, have been falsified, and they are therefore bound, being reasonable beings, to look about for the cause of the error. There are doubtless, as we have said, many such causes, each of which deserves examination and ought to have it. But there is one which is all the more likely to be overlooked because it is the interest of one party to deny its existence, while it is a decidedly unpleasant thing for any Englishman to have to recognize it. The mere aimless love of change; the generous, if not particularly reasonable, desire to "give some one else a turn"; the natural impatience of persons suffering under bad trade, bad harvests, and the like—are all forces which have, no doubt, to be reckoned with. But, when due allowance has been made for all these and their result, there still remains a balance of the balance, as a Yankee would say, which demands its explanation. It would be absurd to deny all force to the appeals which have been made by word of mouth and by the pen during the last few months, and indeed the last few years, on both sides. It would be equally absurd to deny that the immense preponderance of the votes of the electors on one side shows that the style, or the matter, or both, of the appeal of that side has had most influence with them. If we compare the two classes of appeals, it will go hard but we shall discover what sort of argument, or of substitute for argument, is likely to be in the future, as it has actually been in the present, which is now almost past, effectual with the electorate as actually constituted. In the present election there was no single blazing question calculated to draw a decided answer one way or another, as in 1868; nor were there the personal inducements and irritations which undoubtedly played a large part in that of 1874. So far as the election of 1880 has answered any question whatever, it has answered one of a most complicated nature concerning the conduct of a Government not in one conjuncture only, but in a long series of difficult and elaborate transactions. It would be ridiculous to suppose that the average elector has mastered independently and for himself the problem of the Eastern policy of the Ministry. So far as he has exercised his intellect upon it at all, he has exercised it on the views of the question which were presented to him by the rival parties, not on the question itself. It is, therefore, those views and the manner of their presentation which have to be compared for our purpose.

It does not require very great acuteness or a very tenacious memory to discover almost at a glance the striking difference which exists. For the last few months consistently, and, to a great extent, for the last few years, the style of argument of the Opposition has been for the most part a style of pure assertion. We forget whether it was Sir William Harcourt, or Mr. Chamberlain, or Mr. Bright who first promulgated the sentence, "the worst Government that the country has ever known." The phrase revolted at once not merely the sense of fairness and the predilection for decent language which for some time have characterized educated Englishmen, but also the knowledge of history which such Englishmen possess. To compare the actions of the present Government, even viewed in the most unfavourable light, to those of the Cabal, of Danby in his transactions with the Pension Parliament, of Sunderland in the latter days of James II., of half a dozen venal, corrupt, or incapable Governments in the eighteenth century, is simply an outrage upon common sense. But the phrase was rapidly caught up, has been frequently repeated, and has been cheered again and again by crowded public meetings. Take, again, Mr. Bright's famous and favourite monosyllable "lie." This word, either in its blunt three letters or in periphrases hardly less blunt, has been constantly hurled at the Government by their foes. They were a "Cabinet of all the Liars." They lied about the Indian troops, about the Turkish Convention, about Afghanistan, about this, that, and the other. So again with the kindred charge of "stealing." They "stole" Cyprus, they "filched" Cyprus, and so forth. So again about the Afghan and Zulu wars, the management of the finances, the transactions in regard to Ireland, to the Slave Circular, and to a hundred other questions. The Opposition were not content with

questioning the wisdom of these transactions, or with showing how they could have been managed better. Indeed they may be said to have abstained from the latter somewhat perilous attempt altogether. They formulated their objections into more or less striking and succinct phrases, and unweariedly asserted them in season and out of season. Thus the electorate, in matters of which from the nature of the case they could have little or no first-hand knowledge, had put before them, sometimes with great eloquence, and always with unhesitating assurance, views of the various transactions in which the Government had been engaged of which it could at least be said that they were comprehensible to the meanest intelligence. That the Government was composed of liars, thieves, and perhaps a few fools; that they had robbed and cheated and butchered and raised taxes and wasted them; that the only salvation of the country was in a Liberal majority—to these three propositions, varied sometimes, for the most part merely repeated, the vast volume of Opposition speechifying, article-writing, and pamphleteering may for the most part be reduced.

Against this the Government had nothing to do but to argue. Their arguments might be good or bad, but argument was the only weapon they had. When an enemy in public affairs—for in private there are shorter and more satisfactory methods of repartee—calls you a liar, it is useless to reply "I am not." When you are accused of stealing, denial will not save you in popular opinion. The only thing to do is to resort to more or less laborious argument in order to disprove the assertions; that is to say, when they are sufficiently definite to be dealt with in any way. This is what the Government and their supporters have done, or endeavoured to do. We do not say that they wholly succeeded, or that they made the best of such arguments as might have been brought forward. We do not even say that on some points the balance of argument might not have gone against them. But what we do say is, that the battle as actually conducted has been one, not of argument against argument, but of argument against assertion. The Ministerial contention has all along been that, given such circumstances and such means of acting, their action has been as good as could be reasonably expected, and as successful as could reasonably be expected likewise. They have given, with repetition sufficiently wearisome to those who knew them before, the grounds for this contention. Sometimes they have failed to sustain it; oftener they have, in our judgment, fairly made it out. But the point is that their arguments, whether strong or weak, have for the most part been simply ignored. The great chorus has arisen in reply, "You are fools, you are liars, you are thieves, you are the worst Government that England ever knew." It was for the constituencies to decide whether they would attend to the assertions or the arguments. They have decided in a manner which is perfectly unmistakable. They have listened to the assertions, and whistled the arguments down the wind. The "dull defensive war" of appeal to impartial witnesses, to actual facts, or to partial witnesses and to distorted facts, as the case may be—for it really does not much matter—has proved no match for the Opposition attack of unqualified, unproved, sometimes even obviously false and almost impossible, assertion.

It cannot be said that this fact supplies material for comfortable reflection, and the reflection is not the more comfortable because we know the stage we have now reached to have been already reached in other countries. Extreme partisans of the Opposition have sometimes affected to pooh-pooh complaints of violent language and to refer the complainants to the past history of English electioneering. It might be retorted that it is a little odd for such persons to be in one sense, if not in another, of the verb *laudo*, *laudatores temporis acti*. But, in truth, the cases are not parallel. Personal vituperation and sweeping assertion were the guerrillas and irregulars of old election battles; they never formed the main strength of the attack. A few doubtful enemies might be won, a few irresolute friends might be confirmed in their friendship by such means; but the main body went on different principles. The case now appears to be entirely reversed, and the party which has grown out of the ashes of the Whigs certainly cannot adopt the boast of its ancestors, that "Whigs allow no force but argument." It would seem, on the contrary, that Radicals allow no force, but assertion; and, what is worse still, that the vast majority of the electors, to whom it would be absurd to apply any name implying definite political views, agree with them on this point. For the future, then, save at those very rare times when exhaustion, personal inconvenience, party dissension, and the proverbial "next morning's headache" incline the majority to rest and inaction, we may, if the precedents of 1868 and 1880 are to be relied upon, look for two methods only of successful electioneering. The one is the proposition of some measure which may excite the natural appetite for destruction and change which lurks in most men. The other is, to confine the attack upon the adversary to large general assertions of a more or less personal kind, which hardly admit of refutation except by laborious argument, for which argument, as it is now amply proved, the constituencies have no stomach. A cynical person is reported to have said, that with a sufficient staff of orators he would undertake to stump England into voting that two and two make five. The boast is amply justified by the events of the last fortnight, more amply than any man could have foreseen. For it is not here, at any rate for the most part, a case of organization, which has usually been considered to be the sinews of the agitators' war. If in a very few boroughs the victorious party have the advantage in this respect, the reverse is the case in most others and in the counties. The motto of political success in time to come must, it would seem, be not so much "Organize! organize! organize!" or "Register! register! register!" though it would doubtless be rash to neglect these precautions. "Assert! assert! assert!" is the word of the future in English politics. After all, the wisdom of the ancients has anticipated the principle, though not the application. "Throw plenty of mud, and some will stick," is not a maxim of yesterday. Whether men of principle, intelligence, and gentle nurture are likely to adapt themselves to the new method is a question which until recently we should have answered in the negative. But, however this may be, the electors of England have emphatically pronounced that by assertion and not by argument their votes are to be won.

RENAN ON THE ORIGIN OF CHRISTIANITY.

THE third course of Hibbert Lectures was begun on Tuesday last at St. George's Hall by the distinguished French scholar and Academician, M. Renan. It may be remembered that the Hibbert Trust was founded to promote "free and scientific treatment of religious and theological subjects," and that the first course was delivered in 1878 by Professor Max Müller, in the Chapter House at Westminster, and the second last year by Mr. Renouf, a learned Roman Catholic of the Liberal school, who has few equals among living students in his own chosen department of Egyptology. This year the Trustees have fixed on an ex-Ultramontane thinker, whose precise theological standpoint it might not be very easy to define, but whose brilliancy alike of conception and expression is universally recognized. And M. Renan has very characteristically taken for his subject "The Influence of the Institutions, Thought, and Culture of Rome on Christianity and the Development of the Catholic Church." That he would treat his theme as an outsider, or, in plainer words, as a sceptic, was of course understood beforehand; but there are sceptics and sceptics, and the scepticism of M. Renan is as little like that of Gibbon—who has handled the same question in his famous fifteenth chapter—as the refined sarcasm of Mr. Matthew Arnold is like the coarse vulgarity of Tom Paine. It is seldom that a man who has been born and bred a Roman Catholic does not retain through life indelible traces of his original creed in his mental constitution, however widely he may have diverged from the doctrinal belief of his youth; and M. Renan's whole way of looking at Church history is essentially Roman, as will appear in the sequel, though he has long since abandoned all faith in the religious claims of the Papacy. If Christianity on his theory owes its origin, as a world-wide creed, not so much to its reputed Founder as to the "divine enthusiasm," or divine credulity, "of a woman" (Mary Magdalene) in accepting and propagating the beautiful myth of the Resurrection, it owed its universality and permanence to Rome. This is the result to his mind of that "grand historical survey of man's efforts to solve the problems which surround him and have to do with his destiny" which he has set before himself as the aim of his investigations. That there is a certain truth in this view of the case we are far from denying, but nevertheless the lecturer's way of presenting it is a distinctively Roman, or to say the least a distinctively Latin one. But that need not be matter of regret, as it is for this very reason just the view of the case with which an English audience is least likely to be familiar.

M. Renan begins by defining his attitude towards religion, or, as he phrases it, "the religious sentiment," which, though an external, cannot be called a hostile, still less a contemptuous one. On the contrary he considers "the religious feeling a divine thing in man, and a mark of his higher destiny." And the religious feeling is evidently represented to his mind by its specifically Christian form, in which the value and dignity of suffering occupies so prominent a place. He would cordially endorse the well-known teaching of the American poet as to "how divine a thing it is to suffer and be strong." The founders of religion, he tell us, were not "workers in the void"—which apparently means Agnostics—but "the reformers, prophets, *martyrs*, with their protests against falsehood and a gross and fatalistic materialism." The blood of the martyrs has been the seed of every faith. "We are all children of the martyrs," and all great benefactors of mankind have had "to expiate by suffering the good they did." It is not therefore wonderful that there should be no more creative or heroic period in the history of mankind than the martyr age of the Church, "the years which elapsed between the sweet Galilean vision and the death of Marcus Aurelius." During these hundred-and-fifty years were laid the foundations of the great religious system which Rome was destined to spread over the civilised world; for Rome began from the second century to exert a decisive influence over the Christian Church, as will be more fully shown in future lectures. The remainder of the present one is devoted to an exhibition of the nature and conditions of the work which it fell to her lot to achieve. For it was not to the old Roman religion, or anything at all like it, that the world-wide Empire gave an ecumenical predominance coextensive with her own. The pitiful, poverty-stricken "Italiote religions," superstitious, sectional, local, unmoral, had no root of vitality in them. Nor was that wider and grander "cultus of the Roman State," by which Augustus and his successors endeavoured everywhere to supplement or supersede them, any more equal to the emergency. Just as it was not the narrow and austere

culture of ancient Latium, but the broad and massive civilization which she had first herself borrowed from Greece, that she transmitted to later ages, so was it with her religion also. "It was Judaism under its Christian form which Rome propagated without wishing it, and yet with such mighty energy that from a certain epoch Romanism and Christianity became all but synonymous words." This is true in great measure of Western Christianity, but too absolutely expressed. And, although he had spoken in an earlier passage of the great Greek Fathers, Clement of Alexandria and Origen, M. Renan virtually forgets or ignores, as is almost invariably the case with modern Roman Catholic writers, the very existence of the Eastern Church. It is true indeed that the East also lay within the precincts of the ancient Empire, and remained under its nominal rule when the very name had been transferred to a newly organized power in the West. But no one would dream of identifying the Eastern Christianity of any age with "Romanism," in any sense of that somewhat ambiguous term.

In his next point the lecturer is on firmer ground, and if he is viewing the progress of the Gospel, like Gibbon, from its purely human side, he says nothing here which, so regarded, any Christian believer need hesitate to admit. "The unity of the Empire (humanly speaking) *was* the condition precedent of all religious proselytism on a grand scale, if it was to place itself above the nationalities." It has often been the boast of Christian apologists that Rome bridged over the habitable world with her vast roadways and viaducts for the feet of apostles to traverse them. And thus the Empire from the first unconsciously served the interests of the Church. But not quite unconsciously, as time went on. M. Renan says rightly that "there was no persecution for abstract doctrine under Constantine's predecessors"; but long before the fourth century the Emperors had begun more or less clearly to perceive the parasitic growth, as they regarded it, of a power conterminous with the Empire and out of harmony with its existing life. They did not persecute opinions, but they persecuted—and some of the best and wisest of them persecuted most persistently—the organization in which these opinions were localized, and in which an unerring instinct taught them to dread the development of a rival power to their own. It is true that this persecution was intermittent—whence "the Ten Persecutions" are a commonplace of Church histories, though the phrase is rather a misleading one—and that it was not of that minute and vexatious kind which might have been found under a more limited, and, if we may use the word, more fussy kind of Government. There are some very suggestive remarks on this subject in the closing chapter of Dr. Döllinger's *First Age of the Church*. So far M. Renan is certainly right in saying that liberty, including liberty of thought, fared better under the Empire than under the Republic or the Greek commonwealths. "This kind of liberty often enjoyed more toleration under a king than under jealous and prejudiced shopkeepers"; and he instances "the Athenian Inquisition" which put Socrates to death. On the other hand the Church, growing up under the shelter of the Empire, and after the conversion of Constantine in formal alliance with it, borrowed much of the temper of her great auxiliary. It is going too far to say with the lecturer that "the Church became wholly Roman, and has remained to our own days like a survival of the Empire"; but it is true that the Roman Church, to which alone M. Renan's statement can be properly applied, recalls in her history, constitution, and spirit, the Roman poet's famous description of the "arts" by which Rome was to subdue the world.

We must pass over M. Renan's account of "the ethical condition of the Roman Empire at the time of the origin of Christianity," which does not indeed appear to have been very fully reported, and his eloquent and forcible contrast between the moral and religious atmosphere of "the Pagan temple" on one hand and that of "the Synagogue and the Church" on the other, and proceed to notice in conclusion his very interesting comments on the relations of Christianity to patriotism; which betray however, more than any other part of the lecture, the habitual and almost absolute "identification of Romanism and Christianity" in his own mind. It is a just and weighty reflection that many earnest Liberals are apt, in their indignation against despotism, to forget that "political aspirations are not everything here below." It was something far other and deeper than mere political reform which the world was yearning for, and dimly groping after, at the time of the first preaching of the Gospel. But the contrast between Catholicism and nationalism—which is a real one—is drawn in the following vigorous passage, with all the exaggerated sharpness of the advanced Ultramontanism of the days of Pius IX:—

> The establishment of Christianity responded to this cry of all tender and weary souls. Christianity could only have been born and have spread at an epoch when men had no longer a country. If anything was wanting to the founders of the Church it was patriotism. After developing this point at some length, the lecturer remarked that as patriotism wanes, socialism is wont to get the upper hand. Christianity was that explosion of social and religious ideas which became inevitable after Augustus had put an end to political struggles. A universal religion, like Islam, Christianity could not but be at bottom the foe of nationalities. How many centuries had it taken and how many schisms had it cost to form National Churches with a religion which was at first the negation of every earthly country—a religion which was born at an epoch when there could be found in the world neither city nor citizens, a religion which the old republics, inflexible and strong, of Italy and Greece would surely have expelled as poison deadly to the State.

It would have been hardly possible for the Christian Church to acquire and consolidate its ecumenical character except under an ecumenical Empire. The gradual breaking-up of Europe into its various modern nationalities rendered the maintenance of that character increasingly difficult, and had much to do with the "many schisms" of the Reformation era. And hence perhaps the mediæval Popes, in spite of the constant and bitter feuds of Guelf and Ghibelline, clung instinctively throughout to the splendid fiction—for it was latterly little better than a fiction—of the Holy Roman Empire. To this day a curious relic of that assumed alliance of Church and Empire is embedded in the Roman Missal, in the shape of a collect—which has fallen, we believe, into practical disuse—*pro Christianissimo Imperatore nostro*, entreating God to "look mercifully on the Roman Empire, that the barbarous nations may be repressed with the right hand of His power." But while Christianity has created a higher and wider brotherhood than that of race or blood, the idea that it is inconsistent with patriotism, or even with "national Churches," if subordinated to a broader unity, would be disclaimed by most intelligent Roman Catholics, and is not borne out by the records of Christian history. The comparison with Islam is not a happy one, for Islam has never become in fact, and it may well be doubted if it is capable of becoming, "a universal religion." To a Turk religion does not supersede patriotism, but is identified with it. M. Renan's course of lectures, when completed, will undoubtedly supply abundant matter for reflection, but he is a writer who, in spite—perhaps we should rather say in part because—of his seductive charm of style, always requires to be studied with caution. He combines the brilliancy of an imaginative sceptic with the onesided ardour of an Ultramontane and a Frenchman.

OUT OF IT.

THERE are some slang phrases which, if possibly objectionable, are certainly expressive. We are not prepared to trace the origin of the expression which forms the subject of this article, but we believe that most of our readers will allow that it would accurately describe the condition in which, on more than one occasion in the course of their lives, they have found themselves. Without attempting a definition of the expression, we appeal to every one who has experienced the sensation which it describes to say whether or not he enjoyed himself under the circumstances. The worst of such a condition is that in most cases it involves a certain amount of disappointment. It may occasionally overtake us when we expected nothing else, but it comes more commonly when we had hoped for far better things. People often imagine that, if they could only get the *entrée* into some envied clique, their position and happiness would be assured for the terms of their natural lives. At last the much-desired opportunity presents itself, and they enter the celestial portals. Their surroundings when they find themselves there may possibly surpass their fondest wishes, but as regards themselves, all is not satisfactory; on the contrary, they are conscious of a complete though indescribable failure, and they collapse with the lugubrious acknowledgment that somehow they feel "out of it." They are painfully conscious that they have nothing in common with the inhabitants of their longed-for paradise; and these exalted beings give them clearly to understand that they look upon them as flies in their ointment. To have the cup of happiness snatched from one's grasp just as one is putting it to one's lips is mortifying, and the sense of disappointment of one's fondest hopes is even worse. In these days "society," in one form or another, is the most run after of all will-o'-the-wisps, and there are many thousands of people whose highest desire is to be on a familiar footing with some coterie which more especially recommends itself to their tastes. They are ever on the watch for an opportunity of inserting the thin end of the wedge into the desired set. There is great diversity of opinion as to what is the most delectable of earthly circles; but one or two descriptions, taken at random, will easily exemplify the common experience of searchers after social perfection.

There are many people, for instance, who read a little, talk a great deal, and think scarcely at all, and yet imagine themselves to be literary, and entertain an ardent longing to get into a literary set. After anxious and weary struggles they obtain the acquaintance of an intellectual lion-hunter, and, by dint of perseverance, induce this being to invite them to meet some literary people. We will imagine a would-be member of such a clique going to a dinner-party of this description. He congratulates himself that the golden gates are at last about to open to him, and he feels that, after all, patience and dogged perseverance are always rewarded in the end. He is about to find himself among congenial spirits, and his own true worth is going to be for the first time appreciated. Instead of feeling that he is going amongst strangers, he rather seems to be returning to his own brethren and his father's house. On entering the drawing-room, the first thing that strikes him is the ugliness of most of his fellow-guests. His genial host takes him by the arm, and confidentially tells him "who's who." As each celebrity is pointed out to him, he feels as if a star had fallen from his little heaven, so disappointing are the fleshly appearances of those great writers in comparison with the ideals which he had previously formed of them. He is sent in to dinner with the daughter of a savant. He tries to say something clever on the staircase, and tells an amusing literary anecdote as soon as he is seated at the dinner-table; but "Yes," "No," and "Really" seem to constitute the entire vocabulary of his companion. As he cannot

succeed in interesting the fair creature, he tries his other neighbour. This is a lady with a long skinny neck, whose dress resembles a flimsy yellow sack. He talks books and magazines to her for a few minutes, and receives a little cold encouragement. She then smiles for the first time, and quietly says, "You seem to have read a great deal of rubbish." After this he relapses into silence for a time, and has leisure to observe the *literati* devouring their food. There is a famous poet at the opposite end of the table, but all that he can see of him is that he is fat, and has a long grey board. There is a red-whiskered man and there is a red-nosed man, and he knows that one of them is a writer and politician of high reputation; but he could not quite make out from his host's description before dinner whether the nose or the whiskers belonged to the genius. Immediately opposite to him sits a well-known writer of articles in the magazines, whom his host told him he ought to know. This gentleman is apparently a clergyman, and does not look very clean. He never has the opportunity of getting a single word with him during the evening. A famous novelist is in full view. Her books are intellectual, with a strong flavour of the romantic. There is a spirit in them that yearns for the days to come when modern science shall have torn away the veils of prejudice and superstition and the new gospel shall be fearlessly preached. She wears a false front, and seems uninterested in anything except her dinner. Near her sits the writer of some amusing but naughty novels. She has a stern face, and looks like a severe governess. The idea of facing these viragos when they shall be let loose in the drawing-room is terrifying to our novice; but it is some temporary relief to his mind when they leave the room, and the men draw up to one end of the table. He finds, however, that nobody cares to talk to him or to hear what he has to say; so he might as well have saved himself the trouble of cramming up all the leading weeklies and monthlies for the occasion. The whole party listen to the conversation of two men who "talk like books," as unlearned people sometimes say. The most ignorant man in England who would hold his tongue would have made an excellent member of a literary party of this kind, and our novice begins to be conscious that he can scarcely have been invited on account of his prodigious talents. In the drawing-room he finds that the guests break up into little groups and converse confidentially, and he himself is left to his own devices. At last a charitable savant takes pity upon him and enters into a conversation on topics which he thinks suited to the inferior intellect of a poor creature evidently belonging to the outer world. Although the experience is humiliating, even talk of this kind is better than none; but it is scarcely begun when silence is ordered that one of the company may give a recitation in French, and soon after that the party breaks up. As he drives home the aspirant feels that his entrance into literary society has been far from a marked success, and he owns to himself that he had never in his life felt so much "out of it" as he did during the last three hours. If this is the way in which the learned spend their evenings he would rather dine at his club, and it seems probable that the men and women of letters whom he has just left will offer no obstacle to his doing so.

When a man takes a good house in a good country neighbourhood, armed with the best introductions, and is invited immediately to dine at the best house in that best of neighbourhoods, he has every reason for self-congratulation; but let us observe how he passes his evening. The chances are that he finds a large party, and that he and his wife and the curate are the only guests who are not staying in the house. The names of the ladies, written on slips of paper, are thrown into a china bowl, and the gentlemen draw them like lots, in order to see who they are to take into the dining-room. The stranger finds himself between two ladies whom he has never seen before nor is likely to see again, while his wife is between the London doctor and the agent of the Irish estate. The party in the house have their own jokes and interests. At the mention of some apparently meaningless words there is immense amusement, concerning the origin of which the outsiders are absolutely ignorant. The subjects talked of are chiefly the incidents of the day's shooting, or the details of a practical joke played in the house the night before, or the doings of some friends of the family who are mentioned by their Christian names only. The host and hostess are genial enough to the newcomers, but they introduce them to nobody, and talk of little but the common friends to whom their acquaintance is due. This is so much the case that they almost seem to say, "We should certainly not have called upon you at all if Lady Plantagenet had not asked us to do so, and we have undergone the nuisance of having you to dinner (once) to please her only." When the dining-room is deserted, most of the party, both male and female, go into the billiard or music rooms, while only the unhappy outsiders, the hostess, and one aged lady remain to "do company" in the drawing-room. The new neighbours naturally feel that, though present in body, they are, socially speaking, out of the whole thing, and the servant who announces that their carriage is at the door seems like an angel of mercy come to their relief.

To be suddenly thrown amongst a fast set is to ordinary people much the same thing as to be thrown on dry land would be to a fish. The very language of his new acquaintances is to him incomprehensible. A great deal of their talk is made up of apparently unmeaning phrases and scraps from comic songs. Their social intercourse consists of a rough horse-play, in which the ladies join with even greater spirit than the men. In this happy coterie there seem to be two or three "butts," who positively take a pleasure in being affronted for the amusement of the company, while there are one or two ladies who appear to be privileged to say or do whatever they please, and to insult any of the men either by word or act, according to their fancy. A person who has not been fully initiated into these and the other mysteries of this wonderful confraternity is made to feel painfully conscious that he is an outsider, and he is certain to receive no attention or hospitality beyond mere meat and drink. We will cite only one other instance of occasions when one is likely to feel "out of it." A friend invites our wife to luncheon. She implores her to come any day or every day. Whenever they meet, she pesters her to come over at the earliest opportunity, without the formality of sending a previous notice. At last our wife takes her at her word, and drives (five miles) to the house of her importunate acquaintance. Another and more intimate friend of the hostess happens to have arrived a few minutes earlier, and it is at once evident that a mistake has been committed, although it is too late for retreat. Throughout luncheon, as well as before and after, the hostess talks almost entirely to her more honoured guest, and on pretence of taking the latter to her bed-room for a minute to give her a little sal volatile for her headache, remains closeted with her for three-quarters of an hour, leaving her other guest to amuse herself with the reflection that she is altogether "out of it."

It may be that in our times well-bred people are not so flagrantly rude to those whose company they dislike as they used to be in days gone by. There may be none of the coarse rebuffs or duel-provoking insults which were common in the latter part of the last century; but it seems to us that neither is the gentleman of our time so courteous as the man of the old school; and if the man of breeding of the present day is under no circumstances so offensive as was his progenitor when put out, he far more frequently succeeds in making those whom he does not care to please feel uncomfortable, unwelcome, and, in the slang phraseology of the period, thoroughly out of it. And if the man of modern times is an offender in this respect, the woman is often even more guilty. She revels in the art of being politely disagreeable, and enjoys nothing so much as seeing others feel themselves to be in a false position.

CYRANO DE BERGERAC.

THERE have been few more stirring times in the history of the French nation, few more productive of remarkable men, than the period of the reign of Louis XIV.; hence it seems scarcely surprising that, in the crowd and bustle of notable names and important events, some striking figures should have fallen into oblivion who were worthy of a better fate. It is mainly to Charles Nodier and Théophile Gautier that we are indebted for the rescue of Bergerac's name and works from the entire neglect which had fallen on them; Nodier having called attention to the literary importance of the *Voyages Fantastiques*, while Gautier, in his delightful series of notices of forgotten worthies, published under the name of *Les Grotesques*, gives us a vivid sketch of the life and manners of their author. A more curious instance of the influence of a man's external appearance upon his character and conduct we have never met with. He who has been fortunate enough to see a portrait of Cyrano will undoubtedly agree with Gautier in considering that, of all the strange and noteworthy things that rivet the attention of those who profess an interest in this author, that which absorbs the faculties of the wondering student is his nose. It is a monstrous nose, huge and rocky as some savage mountain chain, marking by its immensity a face of singular beauty and power. This terrible projection which went before him through life exercised such dominion over him that it would seem rather that the nose led the man on to the assault than that the man mounted the breach bringing his nose along with him. Be this as it may, however, Cyrano came to Paris at the age of sixteen, and wrought such dire vengeance upon those who so much as looked at the wonderful feature that before long all Parisians passed him in the street with averted eyes, and he himself, despite his tender years, was commonly spoken of as "l'intrépide." Such was the number of duels he fought that he writes in one of his letters, "quand tout le genre humain serait érigé en une tête, quand de tous les vivans il n'en resterait qu'un, ce serait encore un duel qui me resterait à faire."

But, although he spent much of his time and of his energy in brawling and fighting, he by no means neglected the study of literature and of science, of which he was passionately fond. It was at this time that Gassendi was engaged in educating Chapelle, the son of François Lhuillier; Bernier, Hesnant, and Molière being admitted to the lessons that he gave. It is characteristic of Bergerac that, having heard of these lessons, he started off, sword in hand, and intimidated master and pupils into receiving him of their number. With an eager desire to learn and a great aptitude for acquiring knowledge quickly, he soon proved himself a worthy disciple of the celebrated master, and missed no opportunity in after life of bearing testimony to the gratitude and friendship which he bore to his instructor. How much he profited by his precepts may be readily seen on perusal of the *Histoire comique des Estats et Empires de la Lune et du Soleil*, where, in the midst of the wildest extravagance, much deep thought and true learning are to be found. In these works Cyrano has shown that power of making lucky shots which has distinguished many men of genius. It is certainly

after reading some of the recent theories concerning the solar system, to come upon this passage in the *Etat et Empire de la Lune*:—"Je croys que les planettes sont des mondes autour du soleil, et que les estoilles fixes sont aussi des soleils qui ont des planettes autour d'eux, c'est à dire des mondes que nous ne voyons pas d'ici, à cause de leur petitesse et parce que leur lumière empruntée ne sçaurait venir jusqu'à nous. . . . De sorte que tous ces autres mondes qu'on ne voit point, ou qu'on ne voit qu'imparfaitement, ne sont rien que l'écume des soleils qui se purgent." "And," he continues, "as a fire throws out its cinders, so the suns throw out some of the matter which nourishes their fire."

Cyrano had not remained long under the tuition of Gassendi before his friend Le Bret counselled him to enter the regiment of Guards commanded by M. de Carbon Casteljaloux, and, having joined as a cadet, he was wounded at the siege of Mouzon. It was on his return to Paris that he performed the exploit celebrated by Gautier, which, if it were not well attested by his contemporaries, would seem to be a pure romance. His friend the poet Sinière had written an epigram against a powerful noble, and, having been threatened with personal violence, took refuge with Cyrano. Being told that an armed band awaited the passage of the unlucky poet, Bergerac, nothing daunted, sallied forth with sword and lantern, Sinière, more dead than alive, going with him. Cyrano, coming upon the men assembled to the number of a hundred, fell upon them single-handed, killing some, wounding others, and putting the remainder to flight. It was not until 1641 that he devoted himself entirely to writing, his comedy of the *Pédant joué*, which inspired Molière to write the *Fourberies de Scapin*, being acted in 1645. After reading *Le Pédant joué*, we are tempted to quote a statement made by one who assisted at a representation of *The Winter's Tale*, that "it is not a very funny comedy." In spite of its many flashes of true wit, it is disfigured by an affected style and intolerably long speeches. As a specimen of the shorter dialogue it contains, we may quote a few sentences from the scene between the "capitan" Chateaufort and the peasant Gareau:—

CHATEAUFORT.

Où vas-tu, bon homme?

GAREAU.

Tout devant moi.

CHATEAUFORT.

Mais je te demande où va le chemin que tu suis?

GAREAU.

Il ne va pas, il ne bouge.

CHATEAUFORT.

Pauvre rustre, ce n'est pas cela que je veux savoir. Je te demande si tu as encore bien du chemin à faire aujourd'hui?

GAREAU.

Nanain da. Je le trouverai tout fait.

It was probably concerning this play that he had a dispute with the fat comedian Montfleury, which led to his addressing him in the following terms:—"Enfin, gros homme, je vous ai vu! Mes prunelles ont achevé sur vous de grands voyages; et le jour que vous éboulâtes corporellement jusqu'à moi, j'eus le temps de parcourir votre hémisphère, ou pour parler plus véritablement, d'en découvrir quelques cantons. . . . Si la Terre est un animal, vous voyant aussi rond, et aussi large qu'elle, je soutiens que vous êtes son mâle, et qu'elle a depuis peu accouché de l'Amérique dont vous l'avez engrossée." Not content with fathering America upon the unfortunate man, Cyrano forbade him on pain of death to follow his customary avocation; and Montfleury, having the imprudence to appear afterwards on the boards, was immediately greeted by the terrible voice of his enemy, who from the parterre bade him retire or die. It speaks worlds for the dread in which Cyrano was held that the audience did not interfere, and that the actor remained in hiding until Bergerac relented and suffered him to act once more. The best scene in *Le Pédant joué* is undoubtedly that of the Turkish galley, which Molière has appropriated with trifling alterations in *Les Fourberies de Scapin*—a theft from which he had nothing to fear, for the piece was not acted until after Cyrano's death. On the other hand, Corneille helped himself very liberally from Bergerac's writings during his lifetime, and, wonderful to say, met with no worse punishment than a published letter "Contre un pilleur de pensées."

After the wholesale manner in which Corneille had pillaged Cyrano's *Agrippine*, it is surprising, considering the time in which he lived, that the offended author should have shown so much forbearance. So great is the resemblance to Corneille's style, even in those passages of *Agrippine* which he had managed to keep his hands off, that in reading them one instinctively hears the voice of a well-known modern tragedian rumbling and bellowing through the verse. The first representation of Cyrano's tragedy was the signal for a tremendous uproar. Stilted as the language may appear to a modern reader, it is wickedly natural in comparison with its immediate predecessors. Then, as in more recent times, the public was slow to comprehend that the utterances placed in the mouths of fictitious personages could express sentiments other than those entertained by the writer himself; and when Séjanus exclaimed, "Allons frappons l'hostie," the audience rose with indignant cries of "Ah! l'athée! comme il parle du saint sacrement." The priests, who hated Cyrano for his scientific attainments, were not slow to make what profit they could out of such speeches as these:—

TÉRENTIUS.

Respecte et crains des Dieux l'effroyable tonnerre!

SÉJANUS.

Il ne tombe jamais en hiver sur la terre.
J'ai six mois pour le moins à me moquer des Dieux,
Ensuite je ferai ma paix avec les cieux.

TÉRENTIUS.

Ces Dieux renverseront tout ce que tu proposes.

SÉJANUS.

Un peu d'encens brûlé rajuste bien des choses.

TÉRENTIUS.

Qui les craint ne craint rien.

SÉJANUS.

Ces enfans de l'effroi,
Ces beaux riens qu'on adore, et sans savoir pourquoi,
Ces altérés du sang des bêtes qu'on assomme,
Ces Dieux que l'homme a fait et qui n'ont point fait l'homme,
Des plus fermes États ce fantasque soutien,
Va, va, Térentius, qui les craint ne craint rien.

TÉRENTIUS.

Mais, s'il n'en était point, cette machine ronde. . . .

SÉJANUS.

Oui, mais s'il en était serais-je encore au monde?

The Duke d'Arpagon, his former patron, withdrew his support, terrified by the chorus of indignation raised against his *protégé*. Cyrano, deeply discouraged, was thinking of leaving Paris, when an accident happened which compelled him to retire without loss of time. As he was entering the Duke's house one evening he received a violent blow on the head from a block of wood, thrown possibly on purpose. The Duke, seeing an opportunity of ridding himself for ever of an unpopular attendant, "advised" him to go into the country; and Cyrano, in a dying state, was taken from Paris by his friend Tanneguy Regnault de Boiselavis. Tenderly nursed, he lingered on for fourteen months; but, in spite of every care, he died in September 1655, in the house of his brother Cyrano de Mauvières.

A CO-OPERATIVE MAGAZINE.

IT may be remembered that one of the false accusations which grieved Mr. Gladstone most in his recent canvass for Midlothian was the assertion that he had met the demand of the Civil Service for increase of salaries by the suggestion that they should found Co-operative Stores. We pointed out at the time what vast prospects of economic improvement this happy—if in the particular instance unfounded—idea appeared to open up; and we are glad to find that it has not failed to germinate in the fruitful soil of energetic minds. There lies before us an extremely interesting document, professing to be the prospectus of a new quarterly magazine, to be called by the comprehensive title of the *London and Edinburgh*. It is stated in the document that "this high-class Magazine will from the first occupy a leading position as a unique literary periodical." It does not do to pin one's faith too closely to the statements of a prospectus; but we are inclined to think that in this statement the projectors of the *London and Edinburgh* have confined themselves within the strict limits of veracity. Their periodical, should it appear, will in some important features be wholly unique, and we should imagine is likely to remain so. The unicity—if we may be allowed a most useful and wholly respectable term, which somehow has escaped currency hitherto—will not, we think, consist in the appended list of *distinguished* contributors, of whose italic distinction, with one single exception, the world is, we fancy, somewhat ignorant. The list, by the way, contains the name of one lady who is curiously described as "a three-volume novelist." Does this allude to peculiarities of stature and dimensions on the part of the author, or is it an easy fashion of designating the usual form of the work? We cannot say, and indeed it does not much matter. For the charm of the *London and Edinburgh* consists not in its staff, but in the very singular manner in which that staff is to receive the hire which its unique labours will no doubt most worthily deserve.

Those who have studied the history of literature are aware that, until very recently, a fine ceremonial prudery drew a veil over this important part of literary transactions. Nothing was more amusing in the amusing volume of Mr. Macvey Napier's correspondence, issued a year or two ago, than the little *minauderies* that went on between the editor and the contributors of the *Edinburgh Review* on this point. The latter occasionally affected extreme surprise at the discovery of a cheque in the interesting correspondence which, purely on literary topics, they kept up with Mr. Napier, while on Mr. Napier's own part the operation was managed with equal care. No idea of a bargain or understanding could be thought of, and the whole proceeding suggested that of Mr. Wemmick on the morning of his marriage, "Here's a contributor; let's give him a cheque." The distinguished—in italics—staff of the *London and Edinburgh* will not be treated in this fashion; but a refinement of a still happier kind has been hit upon to save their feelings and assist the financial operations of the magazine. Instead of being paid by the latter, they will pay it—a thought of grand simplicity which at once stamps the projector of the *London and Edinburgh* as a genius. The fortunate aspirant whose article is accepted by the unique periodical will have instantly to send one guinea to the editor. But let us hasten to say that he is to have an equivalent. In return for the guinea twenty copies of the magazine will be sent him on the day of publication. These,

it is pointed out, he can either distribute among his friends, or "place them in the hands of his stationer, who will gladly sell and charge a slight commission." Now the price of the magazine being half-a-crown, a moderate acquaintance with arithmetic shows that a potentiality of wealth beyond the dreams of avarice is thus conferred upon a contributor to the *London and Edinburgh.* It is not to be supposed that he is limited to his beggarly twenty copies. The generous magazine will send him as many copies as he chooses to send it shillings, and his friends and his stationers will doubtless, like certain famous Irish hares, "be jostling each other" with half-crowns in their hands. Only there is a slight stipulation; the contributions must not be "lengthy." The reason for this will appear to the deep and patient thinker after a time. Suppose that the *London and Edinburgh* consists of two hundred pages, if all those pages were occupied by a single contributor, one guinea might be all that ever reached the till. Forty contributions, each with its guinea post-office order, would put a very different complexion on the state of affairs. But it must not be imagined that the combinations of the fertile intellect which has devised this scheme end here. If a gifted author is too destitute of friends and stationers, or too lazy or too unskilled in the arts of barter and sale, to relish this plan, there is another. He may pay half a guinea a year and have done with it, and his work shall then have "consideration." Nor let any one reply inconsiderately that there are magazines where he can have consideration for nothing at all but the postage of his MSS. backwards and forwards. There are contingent advantages attendant upon this half-guinea. In the first place, the subscriber will receive the magazine for a year gratis. In the second, there is a possibility of a very good gift indeed. The editor of the *London and Edinburgh* will introduce his rejected contributors to "other editors and publishers" for whose periodicals "such style of matter is suited." Thus, though they may be rejected by the *London and Edinburgh*, they have the satisfaction of knowing that the *Edinburgh*-by-itself, the *Quarterly*, the *Nineteenth Century*, and a score of inferior publications will scramble for them. Imagination fails to conjure up a more majestic idea than that of the editor of the *London and Edinburgh*, surrounded by post-office orders from eager contributors, and sending off his waste-paper baskets hourly by special carrier to Albemarle Street and Piccadilly and Paternoster Row. One suggestion, of great importance to poets, we have hitherto omitted to notice. Poems of about twelve lines only—surely the editor might have made it fourteen in order to include sonnets—can be inserted by taking ten copies instead of twenty. It may also be mentioned that the editor, with some caution, "hopes" that all the contents of his magazine will be noticed by reviewers, and that he assures us that "no entrance fees are charged." The last assurance is not unnecessary, for, we confess, without it we should have been very apt to confuse the guineas and the half-guineas already mentioned with entrance fees, or, as it used to be vulgarly termed, "footing."

There once was a French literary periodical—and a very good periodical too, as it happened—of which one of its most faithful and distinguished contributors has written that it had during its two years of existence no less than seventeen subscribers, besides the staff. *La Renaissance* did not exactly flourish under these circumstances. But the *London and Edinburgh*, it appears to us, cannot fail to prosper as long as it has contributors. Let us take them at forty for prose compositions, "not lengthy," and twenty for poems of only about twelve lines. There is a circulation of a thousand copies at once. It is true that there are some difficulties which seem to require elucidation. For instance, will the management undertake not to sell against the contributors? If they do not, we cannot help fearing that the gladness with which the stationers will engage to sell their customers' copies for them will be small. As to disposing of them to friends, that is a revival of the old plan of subscription publication, and we see no reason to doubt that it can easily be carried out. If a contributor to the *London and Edinburgh* were to call upon a friend and give that friend the choice between hearing the contribution read and buying a copy, or two copies, or the whole batch of twenty, can it be doubted which alternative the friend would adopt? There are authors in country districts, and especially in Scotland, who are credibly said to have made a livelihood for long years by hawking about their own works; and it is impossible to say that an itinerant confraternity of contributors to the *London and Edinburgh* might not (unless the Legislature interfered) have equal success. Moreover it is, unluckily for human nature, quite certain that there is a very large number of persons who would gladly pay ten shillings for the privilege of getting ten copies of a poem of their own printed. It is true that they might do it more cheaply for themselves, but that they do not know; and, besides, there is the joy of seeing themselves not merely in print, but in print cheek by jowl with other distinguished writers in a unique publication. We are disposed, on the whole, to think very well of the chances of the *London and Edinburgh*, except as to its chances of having all its articles reviewed. Here we cannot but think that the editor has allowed his hopes to run away with his judgment. As we have pointed out, it will be his object and interest to have as many articles as possible, and he cannot expect the benevolent daily and weekly journals that review periodicals to give him up their whole space. If he had said "*nearly* all," it would surely have been more worthy of the honourable frankness and explicitness which elsewhere characterize his proposals. Then there is that paragraph about recommending the rejected communications to other periodicals. It is true that he is careful to say "rejected not for want of literary merit," but this may only mean that, as we can very well believe, no contribution will be rejected for want of literary merit. Indeed the conventions of literature make that impossible. Our projector knows that, after passing the contribution on to *Blackwood* or *Fraser*, he could comfort the contributor by urging want of room or unsuitability of style or something of the kind. Now we put it to him whether this passing on does not "something smack," as old authors have it. It would almost seem as if—though that is impossible—he took his future contributors for persons ignorant of the world, and not amply provided with common sense. However, this is but an error of judgment, or it may be the excess of a sanguine and over-confident mind. Confidence is the soul of success, by which we do not at all mean that the trick of success is a confidence trick, though somehow that guinea—but here we had better stop. It is evident that the projector of the *London and Edinburgh* has deserved success already; whether he will command it, time and the hour must show. We should not like to know a contributor to that periodical, because, though in some respects he would be an interesting anthropological study, his tendency to distribute copies of the unique magazine might be painful. But we should like very much to know a stationer who would gladly sell copies of that magazine under the circumstances mentioned, because he would be a useful as well as an agreeable acquaintance.

RACING YACHTS.

IT seems not unlikely that the yacht racing of the coming season will be better than any that has been witnessed for a considerable time. Contests between great cutters are thought by many good judges to be the finest of all that take place on the waters, and it seems not improbable that, at the regattas of 1880, at least four great cutters will be constantly doing battle. The *Formosa*, the latest offspring of the famous Cowes yard, and the indomitable *Arrow*, nominally fifty-five years old, will have to maintain their places, if they can, against two cutters which have been built on the Clyde and at Lymington expressly for racing, and represent the latest ideas of naval architects as to the best method of planning a racing yacht. An unusual interest will indeed attach to the performances of these two vessels. They may be considered as representatives respectively of the Clyde and the Solent; and they may also be said to represent the latest method of naval architecture as against the old system, the Scotch vessel being built of steel, the other of that heart of oak which was once so dear to the British seaman, but is now neglected for all but yachts and coasters. The struggles, then, between these two craft, and between them and the others that have been named, are likely to make memorable the races in which they figure during their first season; and, should any of those races be sailed in a really strong breeze, or should the vessels come in for a summer gale on their way from port to port, their performances may have a wider interest than that which belongs to racing. In both cutters the present system of building a racing yacht has been carried to what seems almost its furthest point of development. Both are very narrow and very deep, and both have, we believe, a larger proportional amount of lead ballast on the keel than any other yachts afloat, except some very small ones. They ought then, according to commonly received ideas, to be very bad vessels in a sea. It seems, however, by no means unlikely that this will not be the case, and that yachts of this peculiar type may be found to possess, in addition to the great merit of being absolutely uncapsizable, the almost equally great merit of being very easy in a sea, and of being able to make their way through the water when other sailing ships are hove to.

Such at least appears to be the view held by Mr. Dixon Kemp, a gentleman who, as we need hardly say, has long interested himself in questions connected with pleasure vessels, and is the author of a very elaborate work on yacht designing. At a recent meeting at the Institution of Naval Architects Mr. Kemp read a paper on the stability of yachts, which has been published in *Hunt's Yachting Magazine* for the present month. In this monograph he compared the types of three well-known vessels of this kind built at different times; and showed, carefully and minutely, the differences between them, estimating with scientific precision the advantages which lead ballast and the placing a good deal of that ballast on the keel gave the two younger vessels as against the older one. After speaking at length of their stability, and showing how this would be largely altered by certain changes in the ballasting, Mr. Kemp stated that the last built of the three, which seems to be of an almost exaggerated type, was an admirable vessel in a sea. This portion of his remarks, though very brief, was undoubtedly the most interesting, as the facts which he mentioned concern not merely yacht builders, but also those who construct vessels of other kinds. Before considering this, however, it may be well to notice Mr. Kemp's account of the stability of the yachts, and thus to follow the order which he himself has observed. There was nothing very novel in what he had to say about the righting power of these vessels; but he had taken great pains with his subject, and was able to describe with singular clearness and in minute detail the qualities possessed by what Americans call the English lead mines.

The oldest vessel of the three, the *Rose of Devon*, which was launched in 1869, is 81 feet long at the load water-line, has 21 ft. beam, and draws 10 ft. of water amidships. The

Florinda, launched in 1873, is 86 ft. long, with 19 ft. 3 in. beam and 11 ft. draught of water; and the *Jullanar*, launched in 1875, is 100 ft. long, with 17 ft. beam, and 14 ft. draught. The *Rose of Devon* is, or was when Mr. Kemp last heard of her, ballasted with iron, while the other two are ballasted with lead, of which there is a considerable proportion on their keels. The differences between the three are remarkable, and, so far as regards the two first named, are, it would seem, almost entirely caused by ballasting. The qualities of the third, however, are in large part due to a great alteration in type. The *Rose of Devon* has a greater initial stability—that is, a greater power of resisting a light pressure of wind than either of the others. Mr. Dixon Kemp calculated that a breeze which would cause a pressure of 1 lb. to the square foot on the sails would heel the old yacht 9°, the *Florinda* 12°, and the *Jullanar* 14°. A breeze causing a pressure of 2·5 lbs. to the square foot would heel the *Rose of Devon* 24°, the *Jullanar* 32°, and the *Florinda* 40°—the *Jullanar*, it will be observed, already surpassing her rival. With largely augmented wind pressures much greater changes would occur, and the newest of the three would have a resisting power far beyond that of the other two. Mr. Kemp shows the qualities of each ship by the well-known figure called a curve of stability—that is, a curve showing the righting power which a ship has at varying angles of inclination. This is usually indicated by giving what is known as the length of the righting lever; but Mr. Kemp has preferred to give the righting moment in foot-tons. The curves set out show that, up to an inclination of about 12°, the *Rose of Devon* has a greater righting power than the *Florinda*, and, up to an inclination of about 16°, a greater righting power than the *Jullanar*. When these inclinations are passed, however, the other two outstrip her; and, at an angle of about 40°, apparently where her righting power is at its maximum, that of the *Florinda* is somewhat greater, that of the *Jullanar* much greater, the last-named vessel's highest resisting power not being reached until the inclination is 70°, at which angle the power of both of the other yachts is rapidly declining, the *Florinda*, however, remaining superior to the *Rose of Devon*. It is clear, then, that the newer yachts have, in all but very slight breezes, considerable advantages over the old craft, and are, in one respect, safer than she is, as one runs less risk of capsizing than she does, while the other is absolutely uncapsizable. These advantages, however, are due in great part to lead ballast. Mr. Kemp, who is not chary of his labour, shows that, with iron ballast, such as the *Rose of Devon* has, the *Florinda* would be much inferior to her, and the *Jullanar* inferior up to an inclination of about 37°, beyond which point, however, she would rise very rapidly, attaining her maximum as before at 70°. What would happen if the conditions were further changed, and if the *Rose of Devon* had lead ballast, Mr. Kemp does not say, but it would be hard to blame him for not showing this. Calculating curves of stability is very laborious work, and Mr. Kemp having set out no less than six for his paper, could hardly be expected to do more. Indeed Mr. White of the Admiralty, who took part in the discussion which followed Mr. Kemp's remarks, expressed surprise at what he had been able to accomplish.

In one way the result of Mr. Kemp's labours may somewhat surprise those who take interest in racing yachts. The *Florinda* is generally supposed to be the most successful vessel of this class afloat; but it would certainly seem as if in one respect she owed her superiority to a yacht of 1869 to her lead ballast merely. With her entrance and run, and the speed which may be due to their lines, we have nothing now to do; but it seems clear that, if ballasted in the same way as the *Rose of Devon* is, she would heel rather more than that vessel in light breezes, very much more in strong breezes, and would be more likely to capsize. She would therefore be a less comfortable and less safe vessel, and, unless superiority in form made up for deficiency in stiffness, would be less weatherly. Of course it may be said that the lines of the *Florinda* are better than those of the older ship; but Mr. John Harvey, who designed the *Rose of Devon*, is acquainted with his craft, and possibly her form is as well suited for rapid progress through the water as that of the *Florinda*. It would be absurd to dogmatize on such a subject or to attempt to draw any conclusions as certain; but the interesting facts set forth by Mr. Kemp show that the type of the most famous yacht of the day is in one respect decidedly inferior to that of a yacht built in 1869, and suggest that the superiority which she would undoubtedly show over the latter in sailing would be almost entirely due to her lead ballast. The *Jullanar* of course differs largely from both, and represents the most advanced type; but she cannot be said to be superior to the *Florinda*, as the many contests between the two in 1878 left them nearly equal, the *Florinda*, if we remember rightly, having slightly the advantage. It must be remembered too that the *Jullanar*, though really larger than the *Florinda*, receives, owing to the absurdity of yacht measurement, time allowance from her. It seems probable therefore that, considered merely as a racing yacht, the *Florinda* is the better of the two. Apart, however, from speed in comparatively smooth water, the *Jullanar* has very great advantages over the other. She is slightly more crank in light breezes, but has far more stiffness in strong ones, is absolutely uncapsizable, supposing that the deck fittings remain tight, and, most important of all, is, if Mr. Kemp's information is correct, an admirable vessel in a sea, far superior to yachts of the proportions of the *Rose of Devon* or the *Florinda*. This fact, to which Mr. Kemp hardly seems to give the weight it deserves, is very important, as it interests not only constructors of yachts, but many others. It had been commonly thought that, to be easy in a sea, a vessel should have considerable beam; and in a recent and very excellent work—Mr. White's *Manual of Naval Architecture*—it is said that the deep narrow ships which were built under the old builders' measurement were extremely poor ones. It is generally considered that a very low centre of gravity makes a vessel decidedly bad in a sea, although it enables her to stand up well to her canvas. Mr. Kemp, however, asserts that "length and depth are the properties on which ease and comfort in a sea may depend," and says that the *Jullanar*, long, narrow, with a very low centre of gravity, could in heavy weather be sailed in comparative comfort, while a vessel with more beam and less depth would be hove to. No harm comes, he says, from the low centre of gravity if the centre of buoyancy is low too, or, in other words, if the initial stability is small. This view, which at first sight seems contradictory to the established one, is very possibly correct; for Mr. Kemp has had great opportunities for observation, and is thoroughly qualified to observe accurately; but it is to be regretted that he has treated this, the most important part of his subject, briefly, and has not brought forward more facts in support of his opinions. It has been said of the *Jullanar* that she was once able to beat to windward in a gale which stopped even steamers, but no account of this performance has, so far as we are aware, ever appeared. It is to be hoped that at some future time Mr. Kemp will amplify his statements on this matter, and will give in support of his views the facts on which they rest. The information he will doubtless be able to afford will have great interest, and will be in one respect novel. The *Jullanar* is, as every one acquainted with racing yachts knows, very good in a stiff breeze; but Mr. Kemp refers, as we understand, to her behaviour under conditions more trying than are often brought about by what is thought a stiff breeze in a yacht race, to wit those produced by a real gale of wind and a heavy sea. It would be most interesting to all shipbuilders to learn fully how a vessel of her type conducts herself when subjected to these tests.

With regard to the bad ballasting which contributes to her peculiar qualities and to the merits of the *Florinda* there is one observation to be made. Racing yachts are now ballasted exclusively, or all but exclusively, with lead, and of late there has been a tendency to put more and more of this on the keel. As has been seen, the two new racing craft which have been built have huge lead keels, and Mr. Kemp in one of his six curves shows what the *Florinda* would be with a keel of this kind weighing forty tons, showing thereby, we believe, the qualities to be expected from an improvement which is being carried out. A twenty-ton yacht has lately been built which is to carry twenty tons of lead in this way, and it seems probable that, with racing vessels, metal keels are likely in future to constitute an even larger proportion of the ballast than heretofore. It is difficult to avoid some conjecture as to what would happen to a vessel thus weighted if she got aground with a nasty sea on, and, bumping heavily, rubbed her lead keel off. If she got afloat again, what sort of stability would she have? Would it not be something like that which Mr. Reed prophesied for the *Inflexible* after action, and would she not be in danger, to use a sailor's phrase, of "turning turtle"? Calculations less laborious, perhaps, than those of Mr. Kemp would give an answer to these questions; but it is to be feared that the answer might be of a somewhat unpleasant kind.

A TREAT FOR THE NEXT CHANCELLOR OF THE EXCHEQUER.

SIR STAFFORD NORTHCOTE was, it seems, too conscientious in his Budget calculations; and though his mistake may have been on the right side, and though perhaps it did not very materially contribute to the crushing defeat the Government has sustained, there can be no doubt that it was a mistake, and one which has in its small way helped towards the general catastrophe. It is a pity that a Minister should suffer for his virtues, but such is the world. It will be recollected that when Sir Stafford announced the intention of the Government to dissolve, Mr. Cross's unfortunate Water Bill had been already introduced, and had raised a general spirit of opposition in all parties. When, therefore, the Chancellor of the Exchequer went on to say that the dissolution was postponed only just long enough to permit him to carry through his financial proposals, every one supposed that the Budget would be a very sanguine one. Unquestionably the temptation was strong to make the very most of everything that told in favour of the revenue, and to extenuate all that was unsatisfactory. Sir Stafford Northcote, however, not only resisted the temptation, but went to the opposite extreme, and made things worse than they really were. In fact, he has been too scrupulous, and has prepared for his successor a handsome surplus. It was very honest of him, but it was unlucky all the same. Every one will remember the bitterness with which Mr. Gladstone criticized the Budget and the amendment of the Probate duties, and there can be no doubt that the criticism told. Experts, indeed, were satisfied at the time that much of the criticism was unfair, and that the financial situation was by no means so gloomy as the Chancellor of the Exchequer painted it. But the general public does not consist of experts, and not unnaturally took the word of so great a master in finance as Mr. Gladstone.

Twelve months ago, when the Chancellor of the Exchequer

introduced his Budget for the year that has just ended, he estimated the revenue at 83,055,000*l.*, and subsequently he estimated the expenditure at 84,200,000*l.*, thus leaving an estimated deficit of 1,145,000*l.* But four weeks ago, when introducing the Budget for the current year, he estimated the revenue which he actually would receive up to the end of March at 80,860,000*l.*, which was 2,195,000*l.* below the estimate of twelve months ago, and made the deficit 3,340,000*l.* As a matter of fact, the revenue amounted to 81,265,055*l.*, which was 405,000*l.* better than the Chancellor of the Exchequer's estimate three weeks before, and reduced the deficit considerably below three millions. In reality, the statement of expenditure just issued shows that the actual outlay was 94,000*l.* less than his latest estimate, and consequently that the result of the year was half a million better than he expected. By the time this result became known the elections had actually begun, all interest in the Budget was forgotten in the struggle that was going on, and the world had no time to stop to correct mistakes in financial arithmetic. On the few who did pay attention to the matter the effect was not favourable. They had been convinced all along that the Chancellor's estimate was too low, and their opinion of his financial judgment was not raised by his having failed at such a critical moment to bring his estimate nearer the truth even for so short a period as three weeks. The failure seemed to convict him of a liability to be depressed by unfavourable circumstances. This impression was strengthened by his estimates for the new year upon which we have entered. For it he anticipates a total revenue of 82,260,000*l.*, but of this 700,000*l.* are from the increased Probate duties; so that from last year's taxes he expects to receive only 81,560,000*l.* But we have just seen that last year's receipts amounted to 81,265,000*l.*; consequently he estimates for the current year an increase of barely 295,000*l.* On the very face of it this is much too low. The falling off of last year's revenue from last year's original estimates was 1,790,000*l.*, but the falling off in Customs and Excise alone was considerably more than this, amounting, in fact, to over three millions, and almost the whole of this loss is on spirits and malt. Taking Customs and Excise together, the decrease in the receipts from the spirit duties is very nearly 1½ millions, and from the malt duty about 940,000*l.*; in other words, the falling off from spirits and malt is nearly 2½ millions, or not a great deal short of three-quarters of a million more than the net falling off of the whole revenue. Part of this decrease is only apparent, for in the week or two preceding the introduction of the Budget a year ago, there was a rush to clear dutiable goods through the Custom House, in the apprehension that there might be increased taxation. And, so far as it is real, it is palpably temporary. The decline of nearly a million in the malt duty is plainly due to last year's very late and very bad barley harvest; and the falling off in the spirit duties is also manifestly due to the depression of trade. We are afraid we must dismiss Sir S. Northcote's suggestion that the people are becoming more temperate as one that will not bear examination. Wholesale conversions, like those that were effected by Father Mathew's preaching in Ireland, might account for the enormous falling off in the spirit revenue of 1½ million in a single year; but, as there had been no such moral revolution in any class of the population, we must set down the change to poverty, not to improved morality. The year has been a very trying one in the rural districts all through the United Kingdom. In Ireland there has been extreme distress, deepening in many cases almost into famine; and in England the difficulties of the farmers have prevented them from employing as many labourers as usual. In the manufacturing districts, again, it will be recollected that the winter of 1878-79 was very severe; that in London, Sheffield, and most of the large towns, subscriptions had to be raised to relieve the distress, and that trade did not begin to improve until near the end of the summer. It is therefore evident that this is the true explanation of the falling off in the revenue. Indeed it may be observed as a general principle that a period of bad trade tells most seriously upon the revenue just when it is coming to an end. The public income continues to improve long after the depression has set in, and it continues to decline for a considerable time after the revival has begun. This latter process is what has been going on during the past year, and the fact affords no countenance to the theory that the people are becoming more temperate. When they have more money to spend, they will spend more (among other things) in drinking. The only question is whether they will have more money in the year upon which we have entered. To us there seems every reason to believe that they will.

We have seen that the Chancellor of the Exchequer has estimated an increase on the whole revenue in the current year over that just ended of not quite 300,000*l.*, and we have shown that considerably more than the whole decrease from last year's estimates occurred in the malt and spirit duties. How exceptional was the falling off of last year will be gathered from the facts that we must go back fully five years—that is, to the year ending with March 1875—to find the Customs income so low, and that we must go still further back to get so small an Excise income. Is it likely, we would ask, that these great items of revenue have not merely lost their elasticity, but have lost all the increase made by them during the past five years and more? Of course, if we are to have another harvest as bad as the last, if it rains all through the summer and autumn, and if the distress in Ireland and the difficulties in England are deepened, we cannot expect improvement in the revenue. But there is no reason to anticipate such a calamity as this. On the contrary, it may be hoped that the cycle of bad seasons has now run its course, and that we may reasonably look forward to a good year. If so, the malt duty will not only yield as much as usual, but perhaps a good deal more, since an increased amount of brewing may be looked for. Moreover, an improvement in the condition of the agricultural classes will enable them to spend more liberally; and a fairly good harvest, which is the only thing wanted to give strength and duration to the revival of trade, will increase the employment of the labouring classes, and by cheapening food will make their wages go further. But if Customs and Excise together should yield as much as they did in the year ending with March 1879, the increase under these two heads alone upon the estimates for the current year would be about 2½ millions. Even if the improvement should be only half as much as this, the Chancellor of the Exchequer has provided for his successor a minimum surplus of one million. Whether the larger or the smaller figure will be reached depends, first, upon the character of the seasons; secondly, upon the continuance of prosperity in the United States and India; and, thirdly, upon the maintenance of peace in Europe. But that, in the absence of an extraordinary combination of untoward circumstances, there will be a considerable surplus, may be regarded as reasonably certain. That this, indeed, is Sir Stafford Northcote's own opinion would appear from his proposals for paying off the accumulated deficits. Those deficits now amount to eight millions, six millions of which he proposes to get rid of by means of terminable annuities ending in 1885; the remaining two he hopes to pay off, partly out of the contributions which he is sanguine enough to expect from South Africa towards defraying the cost of the Zulu war, and partly out of ordinary surpluses. But if he anticipates a surplus, why did he not allow for the fact in his estimates? This would clearly have been the more prudent course, from a party point of view, when going to the country. Perhaps he reckoned upon remaining in office, and in that case he would be the better able to make an impression on the debt by having an available surplus at the end of the year. As it happens, the only effect of his self-denying caution is that he will enable the Liberal leaders to boast that the instant they assume the management of affairs surpluses reappear. There can be no doubt that they may be trusted to improve the occasion.

THE THEATRES.

OF *The Pirates of Penzance*, the new work by Messrs. W. S. Gilbert and Arthur Sullivan, it may, we think, be said, "Why, this is a more exquisite song than the other!" Some critics, American and English, have discovered that *The Pirates of Penzance* is only *Pinafore* in a new dress; while the *Times'* critic, with exquisitely grave absurdity, has pointed out that "the plot is weak, and the chief characters are copies—copies from Mr. Gilbert's own originals—but copies still." It would be about as much to the purpose to say that the plot of *Tom Thumb* is weak; but, as a matter of fact, the plot of *The Pirates of Penzance* is full of matter. As to the resemblance to *Pinafore*, no doubt there is a general resemblance between the two pieces, for the very sufficient reason that both are conceived in the same spirit. This spirit is, as it seems to us, the true spirit of burlesque, and it is as reasonable to complain of Mr. Gilbert's adhering to this as it would be to upbraid a novelist for always writing good English. Mr. Gilbert may be regarded as the inventor of a special form of burlesque, in which what looks at first sight like ordinary everyday life becomes a kind of phantasmagoria bewildering to the spectators, but not to the actors, who accept without a sign of astonishment the most startling narrations and events as if they were trivial and commonplace. There is of course a danger that this kind of thing may be repeated too often, a danger which is common to all specialties in art. Thus far, however, Mr. Gilbert has certainly avoided this difficulty. In construction and in writing, whether of prose or verse, *The Pirates of Penzance* is as fresh and sparkling as possible. "On its own peculiar grounds," says the *Times*, "little fault can be found with it. But," the writer continues, with an absolutely astounding stolidity, "it is different when we regard it as the basis of musical construction, as a libretto. Music is fully able to deal with broadly comic phases of human life. Such a character as, say, Figaro, in the scores of Rossini and of Mozart, stands forth with a graphic distinctness unattainable by words alone." Mr. Gilbert himself has perhaps never written anything quite so exquisitely comic as the passage just quoted. When Mr. Gilbert assumes stupidity it is easy to see that it is an assumption, and the pretence is a shade less amusing than the real thing. Mr. Sullivan's music is, it seems to us, as pleasantly fresh as is Mr. Gilbert's piece. It is admirably suited to the words in the purely comic passages, in many of which Mr. Sullivan's orchestration is singularly ingenious and apt; and in some others, notably a cavatina for the hero in the first act, and a duet for the hero and the heroine in the second, it has true beauty and invention.

The central idea of the many convolutions which go to make up the plot of *The Pirates of Penzance* is that of a young man whose nurse has by mistake apprenticed him to a Pirate King instead of to a pilot. There is, it may be stated in passing, a story in a back number of *Household Words* or of *All the Year Round* which turns upon the same confusion of names. Ruth, the nurse spoken of, relates in a characteristic song how, mistaking her instructions, which within her brain did gyrate, she committed the

irretrievable mistake of binding the young Frederic apprentice to a pirate, and she ends by informing the pirate crew that

> This is how you find me now,
> A member of your shy lot,
> Which you wouldn't have found had he been bound
> Apprentice to a pilot.

Ruth loves Frederic, who, never having seen any other woman, is somewhat in doubt as to whether she is beautiful or not, but is quite prepared to marry her on her assurance that she really is a very fine woman. Unfortunately, just after she has made this assertion, Major-General Stanley's daughters appear, and Frederic and Mabel immediately fall in love with each other. The kindly resolution of all the other girls to talk with great interest about the weather while the lovemaking is going on gives Mr. Sullivan an opportunity for an exceedingly pretty piece of concerted music. The pirates enter stealthily, seize on a maiden apiece, and propose to have the marriage service immediately performed, when the Major-General enters, and presently gives some account of himself in a patter song, each verse of which ends with a rhyme, which he has immense difficulty in finding. The Major-General of course is well informed on all subjects, except those connected with his profession. He is well up in Tenierses and Zoffanys, and he knows the croaking chorus from the *Frogs* of Aristophanes. He is competent to speak with authority of the square of the hypothenuse (which is the more fortunate as it supplies him with one of the rhymes that have to be painfully sought for), and he "can whistle all the airs in that infernal nonsense *Pinafore*," but of things pertaining to active military service he knows little or nothing. He rescues his daughters from the matrimonial designs of the pirate band by pleading *in formâ pupilli*, the pirates being bound according to their own laws never to molest an orphan—a practice which, as Frederic has before pointed out, interferes to a considerable extent with the gains of their calling. The act drop falls upon a tableau composed by the Pirate King, surrounded by his crew, waving the black flag at the right of the stage, while the Major-General, surrounded by his twenty-four daughters waving their handkerchiefs, brandishes the British Standard at the opposite side.

The interpretation of the work is singularly successful. The chorus are admirably trained both in singing and acting, and the band is led with delicacy and firmness by Mr. Alfred Cellier. Miss Marion Hood makes her first appearance as Mabel, the heroine. She has a good voice and her singing has much merit, but, like her acting, suggests the notion that it would have been the better for more training. Miss Hood, with some obvious advantages, has two serious faults to overcome—restlessness and self-consciousness. Miss Emily Cross plays Ruth, the part which was to have been taken by Miss Everard, and plays it very well. Her musical skill enables her to overcome successfully the difficulties of dealing with music which is not particularly well adapted to her voice. Others of Major-General Stanley's daughters are well represented by Miss Gwynne, Miss La Rue, and Miss Bond. Mr. George Grossmith appears as the Major-General. He has the rare art of singing admirably without seeming to possess any voice, and certainly no one could deliver the patter-song with more complete success, with more commendable gravity and absence of exaggeration. There is, on the whole, less of Major-General Stanley in *The Pirates* than of Sir Joseph Porter in *Pinafore*; but the one part is in Mr. Grossmith's hands as careful and attractive a study as the other. Mr. Temple's Pirate Captain suggests, exactly as it should, pleasing reminiscences of the days when such figures as that which he presents, "twopence coloured," were a delight; and he sings the song of "The Pirate King" with capital dash and vigour. Dash is the one thing that seems to us to be wanting to Mr. George Power's performance of Frederic. Mr. Power has a very "sympathetic" voice of true tenor quality, which he uses with great skill and delicacy, and there is nothing to blame in his acting except the fact that he seems afraid to let himself go. This is a fault on the right side, but it is one which gives an air of inefficiency to an otherwise artistic performance. We must take this occasion of speaking of Mr. Rutland Barrington's excellent performance, although he does not appear until the second act, when he enters as the Sergeant in command of a detachment of police, who are opposed to the pirates. Mr. Barrington is as good an actor as he is a singer, and he has a full appreciation of the author's peculiar vein of humour. His song, with a chorus from the policemen, describing how, "take one consideration with another, the policeman's lot is not a happy one," is very funny in itself and is capitally given. We do not propose to discount, by relating them, the surprises of the second act; but it may be said of it briefly that it is as fresh and vivacious as the first. It is, however, to be hoped that, as time goes on, *encores* will either grow less frequent or meet with less ready response. Protest against the habit of *encores* is, it is to be feared, useless.

We have not till now found an opportunity of speaking of the performance at the St. James's Theatre of *Still Waters Run Deep* and *Old Cronies*. In the comedy Mrs. Kendal's impersonation of Mrs. Sternhold is the most interesting point, because it exhibits the actress in an entirely new light, and shows that her range is wider than might have been imagined. The representation is at once forcible and fine, and in the more passionate passages is very remarkable. That Mrs. Kendal's taste is equal to her talent is shown by her avoiding, in the most striking of these, any comparison with Mrs. Alfred Wigan's fine rendering of the same point. Mr. Hare's Potter is an elaborate and highly-finished study of an old—possibly a too old—man. But one could hardly wish it to be changed. Mr. Terriss as Hawkesley is at his best in the later—that is, the stronger—scenes of the play. Mr. Kendal's Mildmay is, like everything he does, carefully thought out and executed; but it interests us less than some of his performances have done, possibly because it is wanting in the variety which the character seems capable of assuming. Mr. Theyre Smith's comedietta *Old Cronies*, which precedes the comedy, is remarkable both as to writing and as to acting. It might be said, not unfairly, that the little piece is all about nothing; but the nothing is so charmingly written, and so perfectly acted by Mr. Wenman and Mr. Mackintosh, that it leaves behind it a singularly pleasant impression—such an impression, in fact, as is caused by seeing a piece of the same calibre played at the Français by picked actors, not, as is too often the case nowadays at that theatre, by players of second-rate quality.

Mr. Hollingshead, by engaging the Hanlon-Lees at the Gaiety, has given playgoers an opportunity of seeing pantomime understood and interpreted as a fine art. Not very long ago we wrote in high praise of Mr. Paul Martinetti, who is the only other fine artist in pure pantomime who has been seen for years in London. The Hanlon-Lees have the advantage of Mr. Paul Martinetti and his company in numbers. All of them, including M. Agoust, who belongs to the troop, can act admirably in dumb show; and several of them, chief among whom are Messrs. F. and W. Hanlon, are both actors and gymnasts. The precision and rapidity with which the most complicated and bewildering "tricks" are executed by the whole company are extraordinary. Two scenes of pure pantomime acting are specially remarkable. One consists in nothing but the constant filching of a spirit-flask from a traveller by the two chief members of the company; the other represents their successive hair-breadth escapes from the pursuit of a gendarme, capitally represented by M. Agoust. Both scenes are worth close observation. The piece has a wild plot, and some wildly punning dialogue. Mr. Righton and Mr. W. E. Penley get all the fun that there is to be got out of two speaking parts.

At the Folly Theatre Mr. Toole has lately produced Mr. H. J. Byron's comedy of *The Upper Crust*, in which Mr. Toole himself plays the most important part. Mr. Byron seldom fails to be amusing. In the piece which we now speak of he is as amusing as ever, and he has avoided a fault which has been found in some of his plays, that of finishing up an entertaining comedy with a weak climax. The construction is that of a keen and practised playwright, and the dialogue, which never flags, contains some of the happiest lines which Mr. Byron has ever written. Unfortunately some of these lines seem to be quite over the heads of the audience. The fact that the name of Adam Smith appears to be entirely unknown to the spectators suggests some curious and not altogether pleasing reflections. It is perhaps even more remarkable that the point of "It cuts both ways—like many old saws" should be missed. There are, however, plenty of points which no audience can fail to take; and, what is perhaps more important for the success of the piece, the author has fitted Mr. Toole with an admirably devised part, which is played as only Mr. Toole could play it. It is the actor's merit that, while he gives full prominence to the broader characteristics of the part, he never neglects or forgets its finer shades. The three ladies' parts are well rendered by Miss Cavalier, Miss Phillips, and Miss Thorne.

REVIEWS.

BURTON'S REIGN OF QUEEN ANNE.*

(First Notice.)

THE addition of a single word to the title-page of these volumes would have been of material assistance to any reader desirous of understanding their method and appreciating their real excellences. As a *supplementary* history of the reign of Queen Anne Mr. Burton's book has merits commending themselves almost at first sight; and the points which it elucidates afresh, or puts in a light surer, and therefore probably truer, than that in which other recent historians have presented them, are very far from being the least important or the least interesting in the range of its theme. Thus, above all, no one will be disappointed who seeks for a judgment at once shrewd and generous of the history of the Union with Scotland in an author to whom we owe the most readable and the most complete History of Scotland up to the time of the Revolution Settlement. Exhaustive, on the other hand, or even fairly well balanced in the relative thoroughness and fulness of its several divisions, the work before us can scarcely be called. The author is perpetually accounting for his transitions and excursions, or apologizing for them; but it is undeniable that the former are often as abrupt as the latter are lengthy. It is quite needless to say that Mr. Burton is one of those who read much and

* *A History of the Reign of Queen Anne.* By John Hill Burton, D.C.L., Historiographer Royal for Scotland. 3 vols. William Blackwood & Sons. 1880.

do not often read in vain; nor need one seek far in these volumes for evidence of the qualities which distinguish the scholar who draws on ample resources from the adept in the art of reproducing at secondhand. Yet this work, produced in his full literary maturity by an historian who enjoys an official pre-eminence beyond the Border, and a widespread recognition on both sides of it, furnishes a noteworthy instance of the untoward consequences of neglecting the artistic, or, one might almost say, technical, side of historical composition. As Mr. Burton lacks neither knowledge nor spirit, so his *Reign of Queen Anne* is abundantly instructive and frequently entertaining; but to any one who has expected to find in this thousand or so of pages something like a comprehensive survey of the period which they profess to cover, the substitute provided is likely to prove disappointing. It will certainly be perplexing to the less advanced student (say at one of the Scottish Universities where no history is taught) who should innocently hope with its aid to master in outline the course of the period in question.

Before taking another occasion of adverting to some of those portions of this History which seem to claim more special attention, we feel bound in some measure to make good the opinion we have advanced as to the general method, or want of method, characterizing it. To compare Mr. Burton's treatment of his subject with that of other recent English historians would be a useless task, since by their narratives of the reign of Queen Anne neither Lord Stanhope, nor Mr. Wyon, nor, to our knowledge, any other English writer with an ambition beyond the favourite duodecimo of the present period, has achieved a conspicuous success. At the same time we cannot but think Mr. Burton's reference to Lord Stanhope as to "one who, when he had made himself fully master of the facts, could be relied upon for absolute justice, with perhaps a tinge of generosity," needlessly patronizing in tone. We are glad to find Mr. Burton, on the one hand, though clearly himself no stranger to some of the battle-fields of which he speaks, ready to make use of the eminently "standard" authority of Archdeacon Coxe; and, on the other, pay to the great historical genius of Ranke a warmer tribute of esteem than is usual on the part of historical writers of established reputation in "Britain." Even for O. von Noorden, scarcely known at all in this country, he has at least a polite word. But of course neither the historian of England in the Reformation and Revolution periods nor Schlosser's conscientious successor has essayed to treat the period of Queen Anne's reign as a distinct theme. There are few themes of the kind which are from some points of view so complete in themselves; and yet, after happily choosing a subject for the treatment of which he has several special qualifications, Mr. Burton appears to have been often at a loss how to arrange the materials before him. To be sure, he is constantly telling us why he has put something in or has left something over; but this kind of unasked confidence is apt to weary the reader, like a letter half made up of reasons for not being longer than it actually is. Now and then Mr. Burton protests that he will not be guilty of deviations from the straight path. Thus, having touched on and quite appositely illustrated the extreme necessitousness of the Court of King Charles III. of Spain, Great Britain's pompous ally and greedy pensioner, he thinks it necessary to add a rather obscure confession of having "been drawn into this separate story further than we should have gone in limiting our history to 'The British Empire.' There is a warning to stop in time, that the name of our country be not unjustly compromised." At other times he passes with extreme rapidity over important events or transactions, or omits to furnish the grounds of statements possessing considerable significance. Thus, after Godolphin has been roundly introduced as "the greatest master of finance and pecuniary economy that ever held rule in Britain," it is annoying to be referred, in support of the assertion, to two volumes of the Calendars of State Papers, *passim*, without obtaining any illustrations from Mr. Burton himself beyond the Lord Treasurer's hesitation in allowing a new silver trumpet to the third troop of Guards before being informed "what's become of the old one," and his vigilant economy in the matter of the Coronation accounts. So important an episode as "the celebrated simultaneous creation of twelve peers" is dismissed in a few lines; nor have we noticed any reference at all to another achievement of the same unscrupulous statesman—that Schism Act which it is comforting to find the *Quarterly Review*, in its recent lively article on Bolingbroke, execrate in no measured terms. But, in truth, we must confess that Mr. Burton's account of the last four years of Queen Anne's reign strikes us as decidedly meagre and unsatisfactory. On the other hand, there is no sparing of space in the relation of the ceremonial of Queen Anne's coronation, or even in that of the externals of the Sacheverell trial. In these instances, however, as in the passages about "multiplepoinding," and other peculiarities of the Scots law, most readers will at all events find an element of novelty; but the digressions concerning the earlier history of the French tongue, and the predecessors of Rapin in England and Scotland, appear to us purely superfluous.

Mr. Burton, we need hardly say, makes ample use of his opportunities and his vigilance as a reader; thus the whole literature, if one may so call it, of the Sacheverell case has by him for the first time been made serviceable to a more balanced judgment of the significance of the entire transaction. Concerning the rather out-of-the-way subject, again, of the French refugees in England—a subject fully ripe for a monograph—he has much that is valuable as well as curious to say. But in his concluding chapter, on the "Intellectual Progress" of the age, he has attempted either too much or too little for any perceptible purpose. We will not assert that this chapter is poorer than the corresponding section of Lord Stanhope's book, called, with even grander breadth, "The Age of Anne," for that would be going far. But who in the world can be interested or benefited by a hasty reference beginning after the following fashion?

> There was in existence a book of great rarity published at Oxford in 1485, being a translation from Greek into Latin. It led the way to the original Greek of the Epistle of Phalaris, who had been Governor of Agrigentum some five centuries before the Christian era, and was supposed to be a master of the Greek language in the period of its purity.

To some readers "Tom Brown," for whose reputation Mr. Burton appears generously to entertain a certain kind of tenderness, may present himself as a discovery, while others may share the historian's estimate of his wit. For ourselves, we can only esteem it fortunate that we are spared a series of extracts from Tom d'Urfey and Ned Ward, lesser and perhaps looser humourists of the same "school." Of Brome, whose *Jovial Crew* according to Mr. Burton was popular in London when Gay was at work on the *Beggar's Opera*, and is accordingly cited in this chapter, we are mysteriously told that "so little is known that he is not easily identified." We had thought that few of Ben Jonson's followers were better known than his "faithful servant Dick Brome," whose works were republished only the other day. But though his play kept the stage in Queen Anne's reign, an extract from it was hardly called for here. The quotations from Swift are unnecessary for another reason—because they are already known to most people; though there are probably but few to whom it would have occurred to reflect on Swift's lines descriptive of the Apollo Belvidere by printing in a parallel column those of Byron suggested by the same statue. Altogether, this concluding chapter scarcely tends to modify the impression which these volumes as a whole, notwithstanding their merits, leave upon the mind—that of unevenness and incompleteness. They are far from exhausting the history of the reign of Queen Anne in its main points, though they include even such odds and ends as the services of the age to the science of geology, and, by implication, to that of palæozoic entomology.

We regret to add that in points of detail also this History shows, in our judgment, a surprising want of finish. Perhaps what seems to us a not unfrequent obscurity of style may not seem the same to others; and we have no space for quotations. At all events, such a word as "uncompliability," and such a phrase as to "exorcise into existence," appear to us to clog the progress of a sentence as much as faultiness of construction. Unfortunately, too, Mr. Burton has been badly served by his printer, whose vagaries are many and various:—*Normandy* for *Normanby*, and *Sylvia* for *Sylva* (Evelyn's), and *Königsburg* for *Königsberg*, and *Legh* for *Queich*, and *condé* (repeatedly) for the Spanish *conde*, together with *Reformation* for *Restoration*, and *Thomas* for *Robert Harley* as the heading of a page. With regard to the last of these blunders, we at first fancied that the Treasurer's cousin might have been in the mind's eye of the printer; but after a glance at the top of the page opposite, it does not need the acumen of Mr. William Blades to account for the misnomer. Since Mr. Burton takes occasion to remind us that genealogy is an exact science, he might have likewise remembered that an accurate terminology is one of its most useful adjuncts. In that case, he would have avoided giving the vague title of "Prince" Frederick to the Elector who afterwards became King Frederick, and whom two pages later Mr. Burton, by a strange slip, calls "King William." In like manner, the famous Margrave Louis of Baden-Baden is in the loose English fashion called Prince Louis of Baden in the same page in which he has received his proper title, and a few pages further is quite incorrectly raised to a dukedom. It may seem trifling to notice such slips as these, but inaccuracy in an historical work is always worth pointing out. The book is not free from incorrectness of a graver sort, which surprises us in an historian of Mr. Burton's attainments and achievements. Making every allowance for laxity of phraseology and for vivacity of imagination, we fail to see how Marlborough could have looked on the Moselle and the Saar as "penetrating to the heart of France." Nor can we accept the first part of the following geographical description of Bavaria early in the eighteenth century—whatever the last clause in the sentence may mean:—

> The largest of these States was Bavaria—an electorate of the Empire, covering a space from Donauworth on the Danube up to the watershed of the Alps, where it marched with Italy and the Austrian Tyrol.

On returning, as we hope to do, to Mr. Burton's volumes, we desire to touch no further on inaccuracies or obscurities of detail. And, in order to have done with fault-finding, we may advert at once to another blemish which we find it difficult to pass by. Mr. Burton would not accept it as a compliment were we to declare our undiminished belief in the candour of his judgments and the straightforwardness of his views on questions of public morality. It is the more disappointing that he should in these volumes, on more than one occasion, have lapsed into an apologetic tone which appears to us very unfortunate. Is it to the purpose, and, if to the purpose, is it fair, after an interesting and entertaining passage describing the evils of the English recruiting organization, to fall back upon the empty generality that "we may safely believe that there were deeper blots in the shape of injustice and cruelties in the machinations by which those who were to be our allies raised their forces"? What avails it, after narrating the strange

story of the execution at Leith of Captain Green of the *Worcester*, and of two of her crew, and characterizing the crime as it deserves to be characterized, to add the quite inapposite reflection that, if Green and his crew had been caught as buccaneers by "any of the Continental Powers of Europe . . . there would have been the question by torture to begin with, while all who escaped the rope would have been chained for life to the long galleys then employed in the coasting and river navigation of the Mediterranean and the narrow seas." That the captain and his shipmates would have elsewhere been cruelly punished for crimes committed by them is no excuse for the fact that, in Scotland, they more promptly expiated a deed they had not done. But there appears to be an unfailing resource in the sentiment of gratitude towards Providence that, after all, Great Britain was in the past, as she is now, different from other nations. It is this sentiment which helps to carry an historian easily through the narrative of such transactions as the "preliminary arrangements" for the peace of Utrecht, at their exclusion from which the Dutch, forsooth, "showed some grotesque tokens of resentment." At the same time we gladly acknowledge that where Mr. Burton enters most fully into parts of his theme, he shows fairness of spirit as well as comprehensiveness of judgment. And we hope, in another article, to indicate some at least of the passages which render the book, notwithstanding its defects, a valuable addition to our historical literature.

HELLENICA.*

THE object of these essays is to bring the meaning and importance of Greek literature nearer to educated English readers who are not scholars by profession. Most of them are such as might be added by way of excursus or introduction to translations of the works discussed; and to those who have any current or recent knowledge of our Universities the names of the writers will in most cases be a sufficient voucher for the competence of the execution. Those who read the originals will find here a welcome companion; and those who do not are provided with interesting and enlightening accounts of what the originals tell us. The essayists have written independently, and there are considerable differences in the extent to which they have aimed at a popular treatment of their subjects. All may be said to express results of scholarship in a literary form; but Mr. Dakyns's paper on Xenophon, for instance, stands as distinctly on the side of literature as Professor Jebb's on the speeches in Thucydides does on the side of scholarship. Oxford and Cambridge are both represented; but Oxford is in a majority of two to one, and has the philosophical interest of the book all to herself. The two full and excellent essays on the Platonic theory of education, and on Aristotle's conception of the State, of which we shall presently have more to say, are both contributed by Fellows of Balliol.

The series is led off by Mr. Ernest Myers with a paper on Æschylus, in which he gives a brilliant exposition of the origin and conditions of the Attic drama, and of Æschylus's poetical character. He takes occasion to correct to some extent the commonly received opinion. Æschylus's magniloquence in poetry and conservatism in politics have both, as Mr. Myers justly points out, been exaggerated beyond the measure of any legitimate inference from the testimony of his own works, partly owing to serious acceptance of the picture of him deliberately exaggerated by Aristophanes to heighten the contrast with Euripides. Mr. Abbott, the editor of the volume, follows with a discussion of "The Theology and Ethics of Sophocles." To extract a complete ethical or theological system from a dramatist is not a hopeful task, and the better the dramatist knows his art the less hopeful it is likely to be. Nevertheless the Greek drama, turning largely as it does on the relations of man to superhuman powers, well deserves to be specially studied for the indications it gives of the half-conscious ethical development of the best Greek minds. Here, as in Pindar (though in Pindar something of conscious purpose is manifest), we watch the gradual displacement of the frank and unquestioning anthropomorphism of the Homeric age by conceptions that aim at satisfying a higher moral and intellectual standard. In this spirit Mr. Abbott has discussed the Sophoclean treatment of the Gods and their dealings with mankind.

Mr. Nettleship's contribution, entitled "The Theory of Education in the *Republic* of Plato," is the longest and perhaps the most interesting in the book. In Germany it would have been garnished with a much greater display of Greek and Latin quotations (which Mr. Nettleship seems purposely to avoid), and published as a monograph. Its general object is to exhibit the vital substance of the original and almost modern ideas which are apt to be hidden from the modern reader by the unfamiliar form of Plato's teaching. The first postulate of Plato's scheme is that education is essentially a kind of nurture, τροφή: "the human self"—mind as well as body—"is a living being, requiring a certain environment in order to grow properly, and capable of growing improperly in an immense variety of ways." Hence a necessary condition of a science of education being formed is a scientific knowledge of the human mind. We must know not merely what we want to produce, but what we have to work upon; a consideration which may seem obvious enough when stated, but has often been forgotten long after Plato's time. Starting from this conception, Plato thoroughly grasped the point that the formation of character, not the imparting of this and that piece of knowledge, is the first thing needful in an education worthy of the name. And here we find the key, as Mr. Nettleship observes, to the practical success of modern, and especially English, school and university training, as compared with the very inadequate means provided by the official instruction. An informal discipline and "preparation for the art of life" has been evolved in the little commonwealths of our public schools, which is at times underrated by educational theorists, but is rightly felt by men of the world to have an importance of its own. When we come to details, Plato's theory of the function of poetry and music is so strange to modern ears as to require a good deal of explanation, and the explanation is carefully given. The poet's duty of elevating the minds of the young and informing them with all things good and beautiful, as conceived by Plato, is compared with Milton's treatment of a similar theme; and Plato's attack on the drama as a demoralizing power is put in a light which makes it intelligible by reference to the miscellaneous novel-reading of our own time. The ethical importance attached by Plato to music is ingeniously accounted for, not by any wild supposition of Greek music having had resources or powers to us unknown, but by the very simplicity of the means then at its disposal and the obvious character of its expression. And if we consider music in its simpler forms, we shall find Plato's view in the main applicable at the present day. No parent of right feeling and good taste would care to have his growing children's ears constantly fed with music-hall songs, or even with such melodies as "Grandfather's Clock." And when we remember that taste and moral feeling were almost inseparable in the mind of Plato and his contemporaries, we shall perhaps no longer think him extravagant. Mr. Nettleship goes on to the refining influence of music in modern life, and suggests, in the following excellent passage, that of all the fine arts music is that on which we can most surely rely for the purpose of raising the general standard of English culture:—

> We may collect engravings, and photographs, and china, and make ourselves learned in the history of art; we may found museums and institutes, and spread casts of Venus and Apollo through the land; we may give thousands of pounds for pieces of clever vulgarity; but we shall not make English life much more beautiful or more joyous, unless we can produce art which will educate the nation to see with its eyes and to hear with its ears the country in which it dwells and the history which it inherits. It is in music perhaps that the outlook is the least discouraging. Here there is a possibility of acting upon large masses with some effect; here social distinctions are less felt; here too the English nature seems to show more aptitude and susceptibility. We can hardly hope to make our great towns beautiful, but it is not chimerical to look forward to a time when they may each have their orchestra and chorus, and adequate provision for hearing them. There is no need to quarrel about the precise educational effect which modern music has or may have. That it has some such effect will not be denied except by those who wish to keep it to themselves, or by those who are irritated at the stupidity of its would-be advocates. The apparent vagueness of its influence, arising from the difficulty of formulating it, is neither a proof of its unreality nor an argument against utilising it. Everybody who is at all susceptible to music knows that he is better for having it, and worse for being without it; he also probably knows that the composers whom the world has agreed to call great are, some or all of them, those to whose music he most likes to listen; more than this he need not be able to say, for a fact is not made more of a fact by being talked or written about. If it be once fully recognised that music has a great emotional power over a considerable proportion of English people, the proper application of the power becomes a public duty, and it is only a question of time to discover the best ways of doing it.

Plato's theory of physical education then comes under review; as Mr. Nettleship not obscurely hints, it agrees pretty well with the practice of the average English undergraduate in excluding intellectual exercises for two or three years. The crown of a man's training, according to Plato's matured view, is the discipline of philosophy and "dialectic," which last is really an untranslatable term. Here Mr. Nettleship has to face the difficult task of giving in a relatively short compass a fair notion of the nature and calling of philosophy as conceived by Plato, and he acquits himself of it with great skill. Some of his remarks on the present state of philosophical studies are worth quoting:—

> A systematic study of philosophy, in the spirit and under the conditions suggested by Plato, is as remote from the modern theory and practice of education as a systematic employment of the arts. His account of what actually took place in his time might be applied with slight modifications to our own: "those who study philosophy at all, do it in this way: when they are just emerged from boyhood, in the intervals of business and money-making, they go into the most difficult part of the subject, I mean logic, and then they leave it; I am speaking of those who become the greatest proficients; and in after years, if they ever accept an invitation to listen to a philosophical discussion, they are quite proud of themselves, for they look upon it as a mere pastime; and as they draw towards old age, their light goes out, all but that of a very few, and is never kindled again." Philosophy in modern England has not even the advantage, a dubious advantage perhaps, of that conventional glory which attached to the word in the society of Plato's day, when a "philosopher" seems to have combined in himself the lofty associations of the "savant" with the social prestige of the "man of culture." It would hardly now be said of philosophy that it is "a place full of fair names and shows," into which the "escaped convicts" of other professions "are glad to take a leap." In the popular estimation, it is a cold and comfortless region, haunted mainly by the fancies of dreamers, the sneers of sceptics, and the formulas of pedants. Not, indeed, that it is looked upon with less suspicion on that account. The cry is as loud now as it was in Plato's time, that speculation unsettles and corrupts the mind of the young. And if we retort with him that the so-called theories upon which society is so hard are often nothing but its own opinions articulately expressed, and though we may not attach so much importance as he did to the love of speculative truth and the dangers of its perversion, we cannot deny that the forcible or adroit expression of what many men are dumbly feeling has in itself an incalcu-

* *Hellenica: a Collection of Essays on Greek Poetry, Philosophy, History, and Religion.* Edited by Evelyn Abbott, M.A., LL.D., &c. London: Rivingtons. 1880.

lable power, and that not only are many honest minds needlessly perplexed by speculative writing and discussion, but that much real force of intellect and character is spoiled or frittered away by the want of method and management in the higher branches of our education.

The final pages of the essay discuss Plato's conception of "the good."

In the next place Mr. A. C. Bradley, who has made himself known in philosophy as well as in scholarship, writes on "Aristotle's Conception of the State." His explanation of the fundamental difference in conditions between a Greek city and a modern nation will naturally have little novelty for scholars, but it is clear and strikingly put. Coming to Aristotle's view of the State as the only means of realizing a worthy life for man, he shows how Aristotle finds in it a "union of right and might" which cannot otherwise exist. "The reason why it is necessary for morality lies in the imperfection of man, and in the fact that the State has might"; a doctrine which, thus summarized and put into English, reads strangely like a foretaste of Hobbes. There is an interesting discussion of the indications in Aristotle of the analogy of the State to a living organism, a matter which has quite lately acquired new importance. If Aristotle here points towards the modern scientific views which are at this day profoundly modifying ethics and theoretical politics, his theory of leisure being a necessary condition of citizenship runs counter to all our present notions, and is a serious difficulty to his commentator. Not only is the Aristotelian ideal of leisure marred for us by the consideration that it depends on the common uses of life being provided for by slave-labour, but the *βαναυσία* which is opposed to the culture of the true citizen is defined in a manner hardly less repugnant to our feeling in another direction. The artist and the musician belong, according to Aristotle, to the "mechanical" classes, because they work to please other people. In our own time the attribution of such a character to such art as M. Delaunay's or Herr Joachim's (to say nothing of Beethoven's or Raphael's) would itself be justly reckoned the surest mark of *βαναυσία* among persons whose tastes were in any degree cultivated. Yet Aristotle's opinion does not merely reflect the prejudices of his time, but has elements of partly apprehended truth in it which Mr. Bradley carefully exhibits. Aristotle's recognition of the practical side of the science of politics, his denunciation of the simplicity obtained by neglecting the real facts, and the stress he lays on the limitation of our ideals by the actual conditions of human commonwealths, are duly brought into prominence. Lastly Mr. Bradley points out that the modern State, notwithstanding the minimizing doctrines of a certain school, is more than a mere guardian of the peace, and endeavours in some measure to carry out Aristotle's conception.

Professor Jebb gives us a discussion of Thucydides's use of speeches in his history, which is excellent alike in matter and in workmanship. Its very thoroughness prevents us from attempting to give an account of it; we can only say in general terms that it should be the companion of every English student of Thucydides who wishes to enter into the spirit of the author, and to learn from him something more than examples of odd constructions. Mr. Dakyns finds an amount and variety of interest in Xenophon which we conceive will be new to most readers. But that may very possibly be for the reason that Xenophon is but little read. The *Memorabilia*, and a book or two of the *Anabasis*—perhaps hardly looked at after school-days—make up the Xenophon even of many scholars. Xenophon pays in this way for his indiscretion in writing Attic which was not only elegant but easy to read. If he had scattered a few hopeless anacoluthas about his minor works he might have made himself necessary to examiners. Mr. Strachan-Davidson, on the other hand, while he does justice to Polybius's merits and importance as an historian, fully justifies the exclusion of his work from the regular course of classical training. Mr. Courtney's short paper on Epicurus gives us in a pleasing literary form the result of Gomperz's labours on the Herculaneum rolls, literally saved so as by fire, which have already corrected to some extent our knowledge of Epicurus's own doctrine on material points. Mr. F. W. Myers's well-written sketch of the splendour and decay of the Greek oracles bears lightly a weight of learning, and leaves the subject, perhaps wisely, without propounding any definite conclusion.

BRIAN HODGSON'S INDIAN ESSAYS.*

THE author of these two volumes, who is still living, went out to India as a young Bengal civilian in 1818, the year in which Warren Hastings died. Nearly the whole of his term of service was spent at Khatmandhu, where he was our Resident or Minister for about twenty years. The nature of this appointment entails much less of that overwhelming and incessant correspondence which occupies the time of diplomatists or Political officers at Indore, Gwalior, or Mount Aboo. It certainly demands much tact, knowledge of Oriental character, and conciliatory firmness. But, owing to the extreme jealousy of interference invariably shown by the Nepal Durbar, and especially by the late Jung Bahadur, the British Resident exercises none of that ill-defined and elastic power which may elsewhere extend from regulating the mere ceremonial of a Durbar to the suppression of a host of iniquitous functionaries. The country is hermetically sealed to Anglo-Indian mercantile enterprise. Even the Resident himself finds it difficult to get across a particular stream or to visit a secluded valley. Occasionally, the post may become one of the highest importance, and it is at all times indispensable that it should be filled by a civil or military officer who enjoys both the confidence of the Viceroy and the goodwill of the Nepalese Court. But, in quiet times, an official stationed at Khatmandhu has mainly to breathe pure mountain air, to sketch from nature and take photographs, and to occupy his leisure with researches into Indian history or Oriental tongues. It is no exaggeration to say that these rare opportunities have seldom been put to much better philological account than by Mr. Brian Hodgson. The present work is a republication of divers essays which, during and after the period of his Indian service, he has contributed to the *Journal of the Bengal Asiatic Society* and to other periodicals. The arrangement of the papers strikes us as slightly unmethodical; and a large portion is taken up with vocabularies occurring at intervals, which, though possessing a lively interest for Orientalists, cannot be supposed to have much attraction for the general reader. But there are one or two essays which politicians might do well to study, and others which contain a fund of very curious details about jungly and aboriginal tribes.

So much has been written on Aryan languages that Mr. Hodgson's researches into the dialects of non-Aryan tribes have a double value. It may almost be said that with regard to certain tribes of the Himalayan region and of the North-Eastern frontier of India he is the one great authority. Additions since his days have been comparatively trifling. It is somewhat difficult to give a summary of Mr. Hodgson's labours, or to classify the deductions to which they lawfully lead. But he seems to have made a deep study of the dialects of the Tibeto-Burman family; of the languages of the broken tribes of Nepal; of the Kirantis who give a name to a large tract of forest; of the aborigines of Central India, and of the Nilgiri hills; and even of those of Southern India and Ceylon. Probably several of the vocabularies may be susceptible of improvement; and it has been questioned, with some show of reason, whether Mr. Hodgson is correct in designating some of these obscure dialects as Turanian. Few Orientalists need to be warned against hasty deductions from the recurrence of divers terms of purely Sanskrit origin, and even of Persian, in such non-Aryan dialects as the Dhimal, the Bodo, and the "uncultivated class" of Dravidian tongues. These Sanskrit words are mere foreigners, pressed into service by chance, necessity, or intercourse with Englishmen more familiar with Aryan tongues. On the other hand, the Koch dialect, spoken by a tribe in the Terai, is nothing more or less than a sort of indifferent Bengali, which any one acquainted with either Bengali or Sanskrit can perfectly comprehend. Occasionally, too, we light on refinements which we should hardly have expected in what Dr. Johnson would have called "savage men and savage manners." Mr. Hodgson can discern faint traces of the dual number in the Bodo and Dhimal dialects. The Vayu grammar boasts of continuative, reciprocal, potential, optative, and causal moods, besides those common to all decent languages. Such phrases as the following in the same language, "They two taste me; they all taste me; they all tasted him," are quoted, we apprehend, to signify the action of the dual and plural of the agent. They are not to be taken as implying a tendency to cannibalism.

The papers about tribes who gave way to Aryan invaders some three thousand years ago appear to us to have more point and significance than mere verbal affinities or discrepancies. Dhimals and Bodos, for instance, live at the base of the Lower Himalayan ranges in Sikhim or Bhootán or in Central and Lower Assam, and grow strong and healthy in a malarious atmosphere which would kill an ordinary Hindu in a fortnight. The Bodos are far the more numerous, as the Dhimals only number a few thousands and seem fated to fade away. They are pithily described as "erratic cultivators of the wilds," and it is rather staggering to be told that, owing to this propensity, neither language has a name for a village. They burn bits of land here and there, and break up fresh soil after the second year. Taxation is levied by the Raja of Sikhim, for instance, on the agricultural implements, and not on the acreage; a light tribute of three or four days' work in the year is also exacted. They have neither sheep nor buffaloes, but a few cows, plenty of goats, poultry, and swine, and some pigeons and ducks. The wife spins and dyes the clothes of the family; the husband makes his own utensils, constructs and furnishes his own house, and brews his own beer. They have no distinction of caste, nor any slaves or servants. They are better fed and housed than many inhabitants of the plains, and there is, in fact, a simplicity and equality amongst this primitive race which ought to charm an ultra-Liberal Association. Concubinage is rare, and, though chastity is prized, adultery is only visited with moderate penalties. It is pleasant to be told that all the horrible customs for which Hindu superstition is responsible are unknown. No suttee, no human sacrifices, and no female infanticide. Violent crimes are rare, and offenders against propriety and custom are admonished, fined, or excommunicated. It is also singular to find a tribe amongst which priests do not form a separate caste. Any one may take up and may drop the priestly office. They worship the elements and the "starry host," offer sacrifices, and have recourse to oaths and ordeals. We observe that the list of deities is rather a long one, and includes a string of rivers, Rajas, lesser deities, and gods taken from the Hindu calendar. They drink copiously of a fermented and subacid liquor, without getting drunk; and, if not very cleanly in their persons, are manly,

* *Miscellaneous Essays relating to Indian Subjects.* By Brian Houghton Hodgson, Esq., F.R.S., Corresponding Member of the Institute, Chevalier of the Legion of Honour, Member of the Asiatic Societies of Calcutta and London, and late Minister at the Court of Nepal. 2 vols. London: Trübner & Co. 1880.

hy, and straightforward. They do not get up grand ...arties, like the Santals; nor do they, like the Garos, cut off the heads of unoffending villagers as a propitiation to some irate deity; and they are not given to the repulsive custom of polyandry, as are the Todas, whom Mr. Hodgson elsewhere characterizes as "filthy." The picture of the savage and simple life of the Bodos is not overdrawn and it is not unpleasing.

The variety of topics handled in these Essays may be illustrated by an account of the Nepalese Mission to Pekin, which starts once in five years. Contrary to all precedent and expectation, the Maharaja of Nepal—we apprehend with the consent of his Prime Minister, who must then have been Mataber Sing—handed over to the author, at the close of his residence in 1843, certain official documents about the routes taken by the Embassy. These papers are remarkable for brevity, and we get but few glimpses of Chinese manners or country, but decidedly clear impressions of the serious discomforts experienced by a Hindu ambassador, scrupulous as to caste and diet, at the hands of those whom he would be justified in terming anything but Celestials. For the first part of the journey all goes well enough. The ambassador is carried in a sedan or litter, stops to cook his own clean food, and encounters no pollution. He rests, moreover, for six weeks at the celebrated city of Lhassa. But, after this point, the sedan is exchanged for a pony, and the pure rice and milk of a Hindu for a villanous compound of brick tea, sun-dried flesh, and even cats and puppies, served up by unartistic cooks and seasoned with impertinent remarks. This sort of treatment lasts over seventeen hundred miles, and things scarcely improve when the pony is discarded for a carriage or cart. The length of the route from Khatmandhu to Pekin may be set down, roundly, at 4,300 miles. The unlucky ambassadors have to cross about 104 or 106 mountain ranges and 652 rivers, of which 607 are bridged. They also get a view of 100 forts and 150 lakes and tanks. The time of departure is regulated by the melting of the snows. Mr. Hodgson inclines to the opinion that there are much larger and wider plains in Tibet than is commonly supposed. That this country is the breeding-place of countless waders and divers, and that waterfowl descend in flocks to the plains of India in October, returning to Tibet to incubate in March and April, was already well known to sportsmen and naturalists. It is very characteristic of Oriental *insouciance* that the Nepalese writer of the summaries repeatedly states in his Diary that they rested at a "nameless spot"; the fact being, we take it, that the haughty Nepalese was either too wearied on arriving at a resting-place to find out the real Chinese word, or else that, like Captain Knockdunder in the *Heart of Midlothian*, he allowed "these tamned Southron names" to go clean out of his head. For members of the Geographical Society, a separate paper or appendage to the Chinese route, consisting in an examination of seven great rivers of Nepal, will have no inconsiderable attraction.

Philanthropists who, like Mr. Gladstone, speak with bated breath and in tones of apology for the responsibilities entailed on us by our Indian Empire, might profitably employ the intervals between one diatribe and another in studying the system of law, police, and judicial administration still prevalent in Nepal. At first sight it might appear that, as Pyrrhus said of the Roman army, these barbarians had nothing so very barbarous about them. There are four and even more tribunals at Khatmandhu for civil and military cases. There is a record office, and a separate venue for cases connected with lands assigned to soldiers, for cases about houses, and for criminals. The courts at the capital are close to each other. There is a court of appeal. There is no long vacation, and no trouble about winter or spring assizes, as the judges have only fifteen holidays in the year, taken at two intervals. The spectacle, too, of a dissatisfied litigant proceeding to the palace gate and roaring out "justice! justice!" has something delightfully primitive about it. There is, further, a sort of ecclesiastical tribunal, presided over by a dignitary who seems to combine the offices of Archbishop and Lord High Chancellor, and who punishes sins of uncleanness and of "eating with those with whom you ought not to eat." But Mr. Hodgson was not content with more formal inquiries about the nature and powers of the various tribunals, the venue of cases, and the limits of appeal. He put some pertinacious and troublesome questions as to procedure, fees, and punishments, which elicited the following replies. Disputes between debtor and creditor are decided by ordeal. The names of the plaintiff and defendant are written on pieces of paper, which are then rolled up in a ball and tied to two reeds. After a Brahman has pronounced certain texts, the litigants, who by this time have walked into a tank, take a simultaneous plunge in the water, while two attendants hold the reeds and balls of paper in their hands. The ball which happens to be nearest the man who first rises to the surface is at once destroyed. The other is carried back to the court, opened, and read out. The name found on this scroll is, of course, that of the victorious suitor, be he plaintiff or defendant. The loser pays a fine to Government, but the winner is presented with a turban, for which he also pays five rupees, the loser being mulcted additionally in the same sum, which goes towards "the purification of the Court." The Government seems to come in for divers other windfalls or perquisites. No allowance is ever made to witnesses or arbitrators; and those who like the notion of patriarchal justice may be delighted to hear that anything like a race of lawyers is unknown. Whipping is the ordinary mode of interrogating the accused in criminal cases, and even if the evidence is sufficient to maintain a conviction, the proceedings are not complete until the prisoner confesses his guilt, to which end, if silent," he is "scolded, beaten, and frightened." Burglary ...d by the loss of both hands; and incest, cow-killing, the ...tion by a low-caste man of a high-caste woman, and robbery, are all capital crimes. Parbutties, as distinguished from Newars, may, in cases of adultery, take the law into their own hands and slay the adulterer, but they must prove the crime afterwards to the satisfaction of the Court, or be hanged for failure of proof. This chapter, we note, is based on queries put several years ago; but we should doubt if the Nepalese have voluntarily taken up Law Reform. And the diplomatic relations between our own Resident and Jung Bahadur or his successor, though amicable, preclude the probability of advice on internal economy being either proffered on the one hand or accepted on the other. Indeed we have quite enough to do with Afghanistan and with Burmese complications to render undesirable any entanglement with the sensitive Durbar at Khatmandhu.

We must question the propriety of republishing certain letters addressed to the editor of the *Friend of India* more than forty years ago, regarding the "Pre-eminence of the Vernaculars." A great battle was then raging in minutes, letters, and editorials, between Lord Macaulay, aided by Sir Charles, then Mr. Trevelyan, Mr. Colvin, Dr. Duff, and some others, as representing what were called the "Anglicists" against the advocates of classical Oriental literature. Not only is the controversy out of date, but the position secured by the brilliant pen of Macaulay has in popular estimation never been seriously questioned. The simple issue then was, whether we ought to try to civilize Hindus and Mohammedans and make them apt scholars, good judges, and fair administrators through the medium of Sanskrit and Arabic or through English literature. No real friend of the natives has ever endeavoured to prove that Lord William Bentinck, Lord Auckland, and Macaulay were wrong; and Mr. Hodgson really misapprehends the object of the fight when he writes about the "pre-eminence of the Vernaculars." The contest lay between Manu and Newton, Kalidasa and Shakspeare. Whether the vernacular languages of India, Hindi, Bengali, and others, could not be improved, and whether the children of artisans and Ryots could not obtain through those dialects the sort of moderate education which the School Boards are now imparting to a similar class in England, was not a question at that time seriously entertained. Some years afterwards vernacular education was taken up in the North-Western Provinces by Mr. Thomason and his successors, and at a later period in Bengal by Sir John Grant and Sir George Campbell, after a feeble attempt by Lord Hardinge. But at the time referred to by Mr. Hodgson, all that we had to see to was "the revival and promotion of literature and the encouragement of the learned natives of India, and the introduction and promotion of the sciences among the inhabitants of the British Territories."

Mr. Hodgson has rendered such eminent services to philology that we regret to join issue with him on what is, after all, but a small portion of his reprint. But his claims to respect do not rest solely on the vocabularies and the customs of unknown tribes. He has supplied the British Museum and other institutions with more than ten thousand specimens of birds, mammals, and reptiles; his drawings of these same species number nearly one thousand nine hundred; he has devoted time and money to architecture and ethnography; he has made a splendid collection of manuscripts in Sanskrit, Persian, and Newar; and his career justifies the reflection that in the wide field of India there is ample room for every kind of talent, for the learning of the savant as well as for the skill of the administrator; for Munro and for Thomason, as well as for Halhed, Colebrooke, Hodgson, and John Muir.

OUR AUSTRALIAN COUSINS.*

CONSIDERING how large a book this is, it is surprising how little information it contains. The big words that the author uses, and the abundance of them, make the progress through his narrative not unlike that through the Australian scrub. The traveller struggles onwards hour after hour in the hope that he will at length come upon some pleasing variety; but everywhere he meets with the same dreary scenery. At the end of the day, when he reposes by the camp-fire, he finds it almost impossible to bring before his mind a single definite scene. He can remember nothing but scrub, endless scrub. Mr. Inglis, in his preface, says, "I do not profess to be a polished writer. The graces of my style are perhaps conspicuous by absence." It is not polish that we ask for, nor graces of style. We should, however, have liked a little plain, simple English. From this his writings are almost as far removed as possible. He has been bred in a bad school—one of the worst of schools. He has been a newspaper Correspondent. In the book before us are incorporated, he tells us, letters which he wrote to the *Pioneer* when acting as Special Correspondent for that journal. It is a pity that he did not give us an entirely fresh work. At all events he might have gone over his contributions, and scored over with his pen three lines in every four. Had the book been cut down to one-fourth of its present size, it would even then have been too big for the matter that it contains. But we are expecting what is impossible. A newspaper Correspondent has long and carefully trained himself

* *Our Australian Cousins.* By James Inglis ("Maori"), Author of "Sport and Work on the Nepaul Frontier," &c. London: Macmillan & Co. 1880.

in the art of expansion, and it is idle to expect that he should of a sudden be able to take to compression. He is like a man who starts off a succession of fire-balloons. If he makes them only light enough, each one will go up and amuse for a few moments. Then it drifts out of sight and is forgotten. But then no one asks that they shall all be gathered and exhibited the following day. It is the more to be regretted that Mr. Inglis has been trained in so faulty a school, as his experiences of life have been varied. He went at the age of eighteen to New Zealand. Then for more than twelve years he lived in India. Ill health came upon him, and for change of air he settled in Australia. He has been "cadet on a sheep-run, gold-digger, travelling agent, and general utility-man, indigo planter, and manager of large estates, journalist, traveller, special correspondent, and newspaper manager." At present he is secretary of an Insurance Company. He has, therefore, seen life under many forms. It is a pity that he did not try his hand at writing quite early in his career, while he was still innocently washing sheep, and long before he had written a single letter to a newspaper. We doubt whether in those days he could, if he had tried, have penned such an admirable instance of the art of sinking as the following description of "an engineering work" near Sydney:—"When to its marvellous construction is added the fact that it lies right in the heart of most magnificent scenery, and affords one of the finest combinations of the wonderful work of man, blended with the noblest natural displays of the wonders of the Creator's hand, it may well stir the curiosity of the most apathetic, and it is certainly well worth a visit." We doubt, moreover, whether in those days he would have called his sheep-dogs "canine creatures," or good horses "equine wonders," or mud "a sloppy deposit," or bathers men "divested of their habiliments." He would have talked of fruitful, and not "fecund," soil; and he would have stared with amazement, when he and his companions were going to fish in the sea, had some one expressed a hope that they would "find opportunity for the exercise of their pleasurable pastime in the fecund lap of the ocean." What would he have understood by it, in those days of his simplicity and ignorance of fine words, had one of his comrades, thrusting his fingers into an open oyster, called out that the fish had closed "its gaping portals," and that he could not free "his imprisoned digits" unless some one severed "the strong contractile muscle of the powerful bivalve"? The author's long residence in India enables him to give a variety to his terms which is more perplexing than pleasing. Thus, in the page in which we were told of the equine wonders, we read of "the course festival," "a gharry," "the famed Munipoorees." We next come across—still on the same page—"spring-looking little 'tats,'" "the *beau-ideal* of a hockey-tat," "calabash hats," "shimmering silks," "a wealth of jewellery," and "a splendid loot." In another passage we find "a meandering bullock-track" quickly turned into a "primitive *via dolorosa*," and ending in "a spacious *débouchement*."

There is apparently nothing that Mr. Inglis looks upon as a greater fault in composition than the repetition of a word. He is describing a country which has, to use his own language, "an eventful wealth of incidents." Eventful wealth, it would seem, requires great variety of words. Hence it arises, no doubt, that, having in one line spoken of horses and in another of dogs, he in the next called them equine wonders and canine creatures. It is evidently this principle that has guided him in such a sentence as the following:—"The same reasons that militate as yet against the erection of costly warehouses, spacious, handsome shops, tell against the establishment of palatial hotels." By "militate" he means just the same as "tell against," while palatial, costly, spacious, and handsome "are all one reckonings, save the phrase is a little variations." Now and then the use of a fine word enables him greatly to add to the length and the dignity of a phrase. Thus he tells us that "some pigeons wheeled round in mazy gyrations." In one passage he describes a rowing-match near Sydney. From earliest dawn the population of the city had turned out *en masse*, we read, to witness the race. Nevertheless, some hours later on, a good many seemed to be still left, for "by mid-day a steady exodus set in from the excited city." A steady exodus, that is to say, at noon, of a population that from earliest dawn had turned out *en masse*. The exodus took a variety of ways. Trains densely packed with eager passengers shot swiftly along the line. Every description of vehicle rolled merrily over the roads, conveying their excited occupants to the scene of action. Steamers ploughed their way, and next threaded their tortuous way, bearing dense crowds of ardent partisans of the two men of the day. The weather was as fine as the author's style. "The sun burst from his canopy of cloud, and, as if sharing in the general excitement, flashed his penetrating rays on bush and rock, and dancing wave, till the sheen on the water was like a vast sheet of burnished silver, flashing from its glittering surface the concentrated rays of many moons. The scene was indeed a lovely one. The arrangements were most excellent." The concentrated rays of many moons that were flashed from the glittering surface of the sheen that was flashed from the penetrating rays of the sun when sharing in the general excitement of a boat-race ought surely to have been separated by more than seven words from the arrangements, however excellent they were. After "a lovely one," the author might have indulged in a fresh paragraph at least. We are not sure that he would not have done well had he left a blank space of at least one inch in length.

In more places than one we find descriptions which read somewhat too much like a puff. We do not object when the author tells us that he was invited to enjoy the sport of a certain district by "several influential run-holders." He does not mention their names, and therefore he cannot be accused of flattery. He certainly is entitled to let the world know that he can reckon among his acquaintances several influential run-holders of the Darling Downs district. But it is a different matter when he tells us that a certain hotel at Sydney, which he names, "has long been acknowledged to hold premier position as the aristocratic and select resort"; and that another, which he also names, "ranks next in order of importance and excellence." At the *table d'hôte* of this second hotel, he goes on to say, "many of the best-known men in this town may daily be seen at lunch-time." Mr. Inglis does not lose the opportunity of praising the Australasian Accident Assurance Association, of which he has had "the honour to be nominated as Secretary." He and his Association have had an uphill task, he laments, to educate the minds of the public into an appreciation of their objects, aims, and character. They have had cold and jealous glances cast upon them by rival institutions. "Existing insurance societies, from the empyrean heights of their immaculate orthodoxy, looked upon us as a nondescript sort of corporation." However, the nondescripts have plodded on and their patience has been rewarded. In the year in which he wrote they had issued 1,550 policies, taking in premiums over 4,000*l*. The modest Secretary thus continues:—

> After meeting all claims, writing off all preliminary and other expenses, we go on our way with a good progressive business well established, our capital all available and well invested, and a growing belief in the soundness of our management and the excellence of our aims becoming more and more general and widespread.
>
> Comparing our career so far with, say, the Scottish Accident Company, we have outpaced it completely, and though we have not as yet touched the working classes much, I look forward with hope and confidence to a great and prosperous career for the society.

Such a passage as this, in which the Secretary turns author and then puffs himself and his Association, contrasts somewhat oddly with the following passage in the preface:—

> The future of Australia lies in the hands of her young men. If they use the mighty power they possess, and send the right men to their parliaments and councils, and purge them of corrupt government, and look on things with a wider and more comprehensive vision; say less, and act more, in fact: act righteously and honestly and loyally, and if my pages of sporting recollection, scenic description, and straightforward criticism, shall conduce in the least degree to this result, I shall think my night oil has burned to good purpose.

It is not easy to see how pages of sporting recollection can in any case conduce to the great ends with which Mr. Inglis opens this fine passage. Perhaps the sentence was so long that, before he brought it to an end, he had altogether forgotten how it had begun. Certainly it is impossible to believe that so wordy a writer as he is can, by his writings, teach any one to say less and act more. But even if we can suppose that his book does conduce to this great result, it is difficult to believe that, when he was burning his night oil, he had not also in view the Society of which he is Secretary as well as the wider and more comprehensive vision of the young men of Australia. After all, he only falls into the ordinary style of new communities, which are certainly greatly given to blow their own trumpets. "Let me," he says in one passage, "identify myself with my adopted country, and speak as an Antipodean Welchman." He should remember, however, that that which may likely enough interest "Antipodean Welchmen" will prove to be dull in Europe. For instance, it is hard to believe that any one on this side of the equator can care to be told, in a print as big as that of Macaulay's *History of England*, that if he goes to see the Zigzag in New South Wales, "he will do well to lay in a modest store of sandwiches and sherry." Mr. Inglis states this important fact as a word of caution to the unwary traveller of sanguine nature. It has already been spread abroad through the columns of the *Pioneer* to the inhabitants of India, and now it is told to those who dwell in these islands. The right of translation is reserved, and we may assume therefore that there is an intention that it shall be translated into foreign languages, and made known to the races of Europe. As some kind of return, we should do well were we to caution the unwary "Antipodean Welchman" of sanguine nature about every place in our continent where they would do well to make similar provision. The list will be, we fear, somewhat a long one, and if it is printed in the large type in which Mr. Inglis indulges, it will surely take more than one ship to carry it over to Australia. But it will be, at all events, a very harmless kind of reading, and it may possibly save some one "Antipodean Welchman" from suffering the pangs which come upon one who has to go without his lunch.

Absurd and dull as this big book seems to us, we should not be surprised were it to have a considerable sale. For, after all, it is written in a style which, bad as it is, appears to be very popular, and it contains a great variety of those petty details which really do interest people if only they are gifted with a high degree of stupidity.

NICOLS'S PHYSICAL HISTORY OF THE EARTH.*

In the reasonable belief that no liberal education can be held to be complete without some knowledge of the leading principles of modern science, Mr. Arthur Nicols has put together a highly

* *Chapters from the Physical History of the Earth: an Introduction to Geology and Palæontology*. By Arthur Nicols, F.G.S., F.R.G.S., &c. C. Kegan Paul & Co. 1880.

serviceable little volume as an introduction to geology and palæontology, bearing the title of *Chapters from the Physical History of the Earth*. While so many excellent text-books exist already, it might, he admits, be thought unnecessary to add to their number. But he finds a sufficient plea for the publication of the present manual in the fact that most works of the kind deal with special subjects in a style too technical for the beginner or the imperfectly grounded student. What is still called for is that the varied stores of knowledge contained in numerous special works should be so combined as to elucidate the general physical and biological history of our planet. As few students have time or opportunity for acquainting themselves thoroughly with astronomical physics, physical geography, biology, osteology, and anthropology, so as to work out for themselves the relations which these sciences, amongst others, bear to geology and palæontology, Mr. Nicols has made it his task to furnish a guide to the leading facts and principles of what the Germans call "earth-knowledge," avoiding as much as may be technicalities and abstruse terminology, and incorporating what has been made good by the highest authorities without encumbering his text with an undue amount of references. At the same time that adequate mention is made of all the most important sources whence facts or conclusions have been derived, the reader's attention is not diverted from the contemplation of nature herself. The result is a work likely to be of great use to the student in his first steps towards science, and to prove generally interesting as it presents a comprehensive outline of the earth's history from the earliest times to the present.

That the mind of the learner may be fitly prepared for the reception of the leading truths of geology and palæontology, the first essential step is to realize clearly the idea of the unity and continuity of physical phenomena, and of the forces which brought them about. To this task Mr. Nicols addresses himself in his introductory chapter. He sketches briefly the stages through which men's minds have been led to this result, casting off one by one the traditional errors or imperfect conceptions of earlier times, and the mythical notions out of which emerged in the first instance all that has been since learnt of the constitution of the universe. Astronomy was the first of the sciences to break the shackles of superstition and fancy, giving mathematical fixity and harmony to the theory of the heavenly movements which had before been vague and empirical, the ingenious guesswork of astrology and priestcraft. Chemistry and physics broke loose from the bondage of alchemy, and the realm of nature, hitherto partitioned into the four elementary provinces of earth, air, fire, and water, was seen to widen out into one broad empire, of which the elements were incalculably numerous, whilst the system was coherent, uniform, and all-pervading. Yet, with all the advances that had been made good in astronomy and chemistry, the interior of the earth remained almost throughout the last century a sealed book. Before the appearance of William Smith's *Tabular View*, in the year 1815, scarcely anything like standing-ground had been obtained for a systematic survey of the history and constitution of our globe. The progress of the science of geology is, as our author represents it, a matter of contemporaneous history, the names of the early masters who have not long passed away—Humboldt, Murchison, D'Orbigny, Lyell, Sedgwick, Hugh Miller, and others—blending with those of living investigators and thinkers in the same field of knowledge. The last and crowning work of this great movement has been the demonstration of the continuity of life upon the earth. Instead of the breaks which had previously been imagined in the order of creation—old species dying out and new forms coming in by some wholly indefinable agency—it was recognized that every individual being of to-day was the offspring by unbroken descent from forms traceable backwards as far as research could penetrate. Whatever differences of structure or formation might be visible between the organisms now alive and the fossil specimens yielded by the rocks were to be explained by no cataclysmic changes interrupting the course or the propagation of life on land or in the water, but by gradual evolution and differentiation under the action of uniform law. Whatever the length of time involved in these wondrous changes, whether in the once living forms themselves or in the earth, their abode and their tomb, their relative ages in geological order were demonstrably determined; and the tables which enable the tiro to take in at a glance the superposition of rocks in the earth's crust, or the succession of forms in the evolution of animal life, have not less scientific certainty than the planetary distances or the laws of the moon's motion. For the origin and classification of the materials of our earth generically known as rocks, with the changes they have undergone in all stages of their formation through the operation of physical causes, such as contraction and displacement, the action of fire, water, air, frost, &c., the learner has to look to geology. For the growth and the relationships of the various forms of life disclosed by the fossil remains of those earlier ages he has recourse to the teachings of palæontology:—

From these rocks we learn the marvellous history of *life*. They are the records, which nothing can falsify, of a steady progress under eternal laws from lower to higher forms of being. Any one of us with sufficient diligence can read these records. They tell us that the earth has been the scene of life and death, pain and pleasure, for incalculable ages. The plan has ever been the same—immutable as the laws of matter—but it has been expanded by gradations, always, as far as we can judge, tending towards a higher order of things. Geology tells us, in unmistakable language, that the land and water have changed places repeatedly, that continents have sunk, that oceans have been filled up, that both inorganic and organic rocks have been raised into mountain chains, that there has been a long succession of forms of life appearing and disappearing throu[illegible] cycles of time whose vastness we cannot fully comprehend. Thousanc[illegible] years must be as seconds of time to him who would compute the earth's age, and whole species and genera of plants and animals are but so many finely graduated marks on the great scale of life-duration.

In the first part of his work the author traces the story of the rocks, beginning with the unstratified series, which he shows to have been the parents of the stratified deposits, formed as the latter were by various physical agencies from the *detritus* of earlier azoic materials, and fitted for the introduction and gradual development of organic life. The physical constituents of each series, their relative order of deposit, the influences of upheaval, subsidence, and denudation in altering their superficial aspect and their conformity of level, are briefly but adequately explained; and the reader is thus prepared for the second and more prominent portion of the work, which treats of the history of vegetable and animal life upon the earth and in the waters from the earliest period, and of the succession of lower and higher forms throughout the whole series of rocks, illustrated by descriptions and illustrations of the fossils characteristic of each formation. This enumeration leads to an instructive chapter upon the continuity of life:—

Fossils mainly represent extinct species of animals and plants; but the great types to which they belong have always survived. Throughout the history of the earth, fluctuations in the tide level of life have repeatedly occurred; nevertheless it has been steadily rising during all time. In Laurentian times, it was at its lowest, and appears gradually to have advanced in three successive waves of molluscan, reptilian, and mammalian forms, severally represented in the PRIMARY, SECONDARY, and TERTIARY eras, culminating in man. We can point distinctly to a time when nothing approaching a mollusc had appeared, to another when no living creature among many species possessed a backbone, and to a third when none suckled its young. First among recognizable organized beings, the foraminifers have persisted through all the formations, and are with us now; so have their immediate successors, the molluscs, as a group, though some remarkable members of it are extinct. Hence it would seem that the lower organizations have the best chance of surviving, through the very comprehensiveness of their type. More complete and highly specialized forms have departed, while these, the starting-points of structural progress, are left to indicate the line of ascent to more complex types. That such an ascent is much more than an ingenious hypothesis, no palæontologist will now dispute, even if he holds that it does not explain the almost sudden appearance and disappearance of some large groups. We cannot pass from one formation to another, either upwards or downwards, without encountering the strongest suggestions of lineal relationship between the fossils of rocks in superposition.

Mr. Nicols points to the proofs to be seen in nature of this ascending scale of life, indicating a primary law operating over the whole vast period included in geological time. At one extremity we see man, at the other a mollusc or foraminifer. Gradations rising through crustacea, fishes, reptiles, and birds, up to mammalia, fill the interval. The general or comprehensive type is seen to precede the special and the complex, organic affinity forming an indissoluble bond of connexion between the lowest and highest. To this proof a further potent argument is added from the researches of Von Baër. This sagacious naturalist pointed out that the young of animals resembled the genus to which they belonged more nearly than the species or the individual organism. In other words, the embryo possesses the characters common to the group, developing those of the individual only at the adult stage. This observation has been confirmed by Mr. Darwin and other naturalists, who have shown that we have in the career of the individual the epitome, so to speak, of the history of life itself from its earliest traceable beginning. Could specimens of all organisms, living and fossil, be gathered together in one collective view, the continuity of life throughout the entire series would be indicated with no less clearness than the pedigree of any family or the identity of any individual among mankind. The testimony is as yet imperfect, there being gaps innumerable in the series of palæontology, or, as Mr. Darwin puts it, in the pages of the biological record; but all evidence points the same way, and unexpected facts turn up from time to time contributing to the supply of missing links. A striking instance of this is to be seen in the fossil remains which within the last few years have made good the pedigree of the horse through the hipparion and eo-hippos. To fill up a still more important blank we await the disinterment of fossil lemurs.

At the same time, as our author is careful to note, the doctrine of evolution is not to be set down as final and all-sufficient. As a working hypothesis it enables the palæontologist to classify and compare his facts, and to give them a meaning, intelligible so far at least as our knowledge extends. With wider and deeper research it may be modified or expanded, as astronomical theories have in succession given way before advancing light. What we may reasonably anticipate, however, is not the reversal or abandonment of the theory, but its ampler extension and clearer definition. As the nebula seen under higher telescopic power assumes forms of ever-growing symmetry and splendour, and the minute formless organism comes out into unexpected complexity, grace, and beauty as the power of the microscope is brought with more and more intensity to bear upon it, so may we count upon every fresh exploration of the field of life giving greater definiteness to our ideas of its continuity, and deeper conviction to our belief that nature is ever one and the same.

In the second section of his work the author traces the successive stages of life as manifested in the rocks, from its earliest vestiges in the Laurentian deposits, noting by the way the controversy as to the organic character of *Eozoon Canadense*. The illustrations which accompany his pages will greatly assist the learner in framing correct and clear ideas of the various forms in which life has developed itself in the waters and upon the land, and in recog-

nizing them when carrying on his studies of nature, as he should never fail to do to the utmost of his opportunities, with the aid of a museum or a collection of fossils. Without such adjuncts the most admirable of manuals as well as the amplest and most precise of oral teachings will be found but of secondary value. In Mr. Nicols's little work the student will find precisely the guide he needs in entering upon this stage of his inquiries. He will be able to draw out for himself the history of life upon the earth as it is to be deciphered from nature's records, the long series culminating at length in man, whose origin, affinities, and development he is taught to investigate by the same methods and with reference to the same principles as the lowlier or less complex types which have preceded him. The gains made by science in the discovery of indications of man in a fossil state are briefly touched upon by Mr. Nicols, who discusses, without dogmatizing, the monogenistic and polygenistic theories of man's origin, and his affinities with the lower animals, considering him strictly from the zoological point of view. The various estimates of man's antiquity, with the evidences upon which they have been made to rest, are criticized in a cautious spirit. The fossil skeletons from Gundaloupe are far from pointing to an extreme age, the limestone breccia in which they were found imbedded being of rapid formation, and the skeleton in the British Museum being carefully disposed in an attitude which betokens anything but a remote period of interment. The body laid on its back, with the hands crossed in modern Christian fashion, not doubled up as in all known cases of Carib or early Indian burial, with vestiges of the original animal matter mingled with the phosphates of the bones, would suggest a date much nearer our own times. More definite are the indications yielded by the skulls and bones of men under many layers of alluvial soil, under manifold strata of forest growth, and in conglomerates of coral reef in parts of America and the adjacent islands. The outlines of the mammoth, reindeer, horse, and other animals never known within the historic period in the region where these remains are found, form part of the illustrations which enrich Mr. Nicols's pages. Both in narrative and argument he shows a command of his subject and a power of imparting instruction which entitle him to the confidence of the reader.

ISLAM IN CHINA.*

JUST about the time when Mohammed was entering in triumph the city of his birth which had so long contemned and rejected him, a maternal uncle of this same Prophet was on the seas of the furthest East, carrying the "good news" of Islam, along with the merchandise of Arabia, to the traders of Canton, a port which was well accustomed to the sight of Arab faces, and which had for centuries formed one of the links in the brisk trade which was carried on between East and West *viâ* Persia and Arabia. The Prophet's uncle was doubtless urged to this voyage more by the interests of commerce than by the spirit of the propaganda; nevertheless, like all the early Muslims, he would not lose an opportunity of addressing a word of exhortation to an unbelieving people; and the kindly reception accorded to him and his gospel bred a corresponding zeal in the teacher, so that he asked and obtained from the Emperor of all the Celestials free leave to practise his new religion in Canton, and even to build a mosque there. Thus the first of the six mosques of Canton was built nearly thirteen hundred years ago, and the seeds of a great Musulman population sown. The maternal uncle returned to Arabia to visit his distinguished nephew; but Mohammed was dead, and his uncle, after weeping upon his beard, took his weary way back to China, armed with an authorized version of the Koran as revised by the orders of the First Khalif.

The Arab traders whom commercial enterprise periodically brought to Canton began now to regard the place rather as a colony than a mere trading mart. They settled there in considerable numbers, under the auspices of the uncle of their Prophet, and worshipped in the mosque he had built. In later times they would come and do homage to the Muslim missionary's grave, hard by this mosque. Thus there grew up a veritable Arab colony in Canton which bade fair to take the lead of the natives by its energy in commerce and its consequent wealth. This colony was augmented from time to time in many and strange ways. The 'Abbásy Khalifs of Baghdad were firm allies of the Chinese Emperors, and one of them, El-Mansúr (or Almanzor, as our pre-Lane *Arabian Nights* would have it), sent a contingent of troops to help the Emperor against a rebel who was giving him serious trouble. These warriors would prefer to stay with their colonized countrymen rather than march the long journey back to Persia or Syria; and thus the numbers of the Chinese Muslims were mightily swelled. Then, when Genghiz Khan was overturning the existing state of things in all Asia with his Mongol hordes, refugees and war-prisoners came to add to the colony, which grew and flourished and spread through all the provinces of China. These offshoots from the mother-colony of Canton used a peculiar means of increasing their population. Apart from the natural addition to their numbers, they took advantage of their own wealth and prosperity, and of the extreme destitution and poverty of their Chinese neighbours in time of dearth and famine, to buy from them their starving children, whom the hungry parents were only too willing to get rid of. These the Muslims brought up in the Arabian faith, and thus whole towns were peopled by Chinese converts. This custom was the more necessary as the Muslims were not allowed by their law to marry any but Muslim women, and these were in a minority in a colony composed mainly of traders and soldiers. Still they made up for this deficiency by taking Chinese women as concubines; and the fruit of these unions and of the Muslim marriages proper, added to the purchased children, resulted in a very rapid increase of population. Indeed, so quickly did the Mohammedan colony grow that the few traders who taught the faith of the Arabian Prophet at the end of the first quarter of the seventh century have now developed into a population of some twenty millions of Muslims, almost all of the severely orthodox sect of the Hanafys, and all as good Mohammedans as one would wish to see anywhere.

These Mohammedan Chinese form a separate and distinct race by themselves. They are not Chinese, nor Arab, nor Tartar; but something of all of these. Their sloping eyes might be Chinese, if it were not for the Arab fire that lurks under the lids; their high cheek-bones remind one of the large infusion of Tartar blood in their veins; whilst their proud carriage, their well-made muscular bodies, and their fine cast of features, point to their Arabian ancestry. In character they resemble the Chinese proper no more than in appearance. They are vastly more energetic—a fact due, no doubt, in part to the comparative rareness of opium-smoking among them, but mainly to their diverse origin; they are "as honest as the day," which is more than one can say for the rest of the inhabitants of China; they make upright traders and just and impartial magistrates. They live together in singular harmony; and, generally speaking, they form the hardest-working, most efficient and energetic, and, at the same time, most respectable and honest and loyal portion of the Chinese Emperor's subjects.

An especial interest attaches to these people at the present time for several reasons. The British public is for the most part only awake to those matters which obviously affect what are called its "interests." As these twenty millions of Mohammedans in China do not seem to be obviously connected with those interests, the British public ignores their existence. When these Muslims rebelled against an unwarrantable and cruel persecution and founded the Panthay kingdom, and, finding themselves on the brink of destruction, sent a prince to implore aid of England, our interests did not seem to require the existence of the Panthays, and thirty thousand of them were butchered in Talyfu. Since then the shortlived independence of Eastern Turkestan under its Mohammedan ruler, the Atalik Ghazy of Kashgar, has again called the attention of England to the importance of these Chinese Muslims, and it is probably due to the books that have been published about that sensation of Central Asia, Yakoob Beg, that anybody in England knows that there are any Muslims at all in China. That there are twenty millions of them, that they are spread over the whole empire, that they congregated in such numbers in Yun-nan as to form an independent kingdom which was able for twenty years to resist the whole might of China; that Eastern Turkestan itself is Mohammedan, and was made independent by Mohammedans—these are facts, we believe, little realized by Englishmen. They are not realized simply because they do not seem to have any connexion with British commerce, or with any of those matters we care most about—not even with British missions, for somehow we do not succeed much in converting Mohammedans. There are, however, as we have said, reasons which give this curious people dwelling in China, yet not Chinese, a peculiar importance. One of them is the present, dislocated and precarious condition of the Chinese Empire; its financial difficulties, its official corruption, and the poverty and discontent of its taxpayers. Another reason is the energetic and progressive character of the Mohammedan population and its desire for independence, the attainment of which it confidently anticipates. In any revolution in China this vigorous pushing minority is not unlikely to come to the front; and, if it once gained a temporary ascendency, so weak is the hold of the State religion or of Buddhism on the Chinese that it is quite conceivable that the majority might acquiesce in the rule of an heretical minority. The addition of even a quarter of so vast an empire as China to the list of Mohammedan kingdoms could not fail materially to affect the relations of Europe and Asia and of the various States in Asia. The presence of a new and considerable Mohammedan Power would complicate the Central Asian question in no common degree; and the designs of Russia upon our Indian Empire would be in great measure cast into the shade by the more imminent danger in the further East.

It may be said that it is useless to waste time in the contemplation of a chimerical future. There is certainly no probability of any Mohammedan supremacy in China, but a large increase of the Muslim power there is assuredly among the possibilities of the future. This strange race, the Muslim Chinese, has grown rapidly, and shows no sign of diminishing its rate of increase. It has not only increased in numbers, but it is, as a rule, richer than its neighbours. The Emperors of China have discovered its merits, and entrusted Muslims with various posts of importance in every grade of the official classes; and the Muslims have justified the trust and shown themselves better servants than their Confucian rivals. The result has been an increase of Imperial favour, which has scarcely been shaken even by the violent and bloody contests which the jealousy of petty officials has from time to time stirred up between the Muslims and

* *Le Mahométisme en Chine.* Par P. Dabry de Thiersant, Consul-général et Chargé d'affaires de France. 2 vols. Paris: Leroux.

their neighbours. Indeed the courage and obstinacy with which the Muslims waged their twenty years' war against the Imperial armies has rather added to the esteem in which they were held than the contrary; for they have proved themselves formidable. Thus we find a numerous and energetic people of foreign creed in the midst of a crumbling Empire—a people who are distinct from the rest of the population, yet conform sufficiently to their customs to be regarded as practically part of the nation; a people who have proved themselves superior in all moral and intellectual qualities to the rest of the inhabitants of China, and have thus gained the confidence of the supreme Government. We find this people clustered in millions in the south-western province of Yun-nan and the north-western provinces of Kan-suh and Eastern Turkestan, besides being sprinkled thinly over the rest of China. It is this congregating in special localities that makes the danger. Yun-nan is perhaps the most fertile province in China, and is possibly the key of a great trade route in the future; and Yun-nan was the seat of the Panthay kingdom, and is still mainly Mohammedan. Kan-suh contains eight million Muslims; and it was in Kan-suh that the insurrection originated which resulted in the independent Muslim kingdom of the Atalik Ghazy, whereby Eastern Turkestan and part of Kan-suh were freed from the Chinese yoke. Eastern Turkestan is again Chinese, and Kuldja, to the north of it, is restored to the Celestials by the Russians, who only occupied it, as they say, for the better security of trade during the disturbance caused by the Atalik Ghazy. Yun-nan and its Panthay kingdom has been trampled upon and drenched with blood. All is again under the Emperor's rule; but for how long? Will these ambitious people, who have already made so good a fight for their independence, give over the struggle? And, as they are increasing in strength and determination in proportion as the other Chinese are becoming weak and divided, is it not probable that a fresh struggle may end in something more than the partial success that crowned their former efforts? In short, will China be able to repress these strong Mohammedan efforts at disintegration, or will the Empire have eventually to submit to division on the creation of a new Mohammedan kingdom?

These surely are sufficient reasons for giving some share of our attention to this important department of Chinese politics. So important may it become to English interests in Asia that it is to be regretted that we are not better informed on the subject in our own language, instead of being indebted to a French Consul for our knowledge of many of the most weighty facts and statistics. We cannot, however, confess ourselves grateful for much more than the bare facts, for M. de Thiersant has wrapped up his statements in an extremely opaque envelope of mere verbiage; and he has seemingly taken a malicious delight in arranging his book in a perverse order, repeating endless decrees to identical effects, and generally spreading forth ink and paper before an unsympathizing, not to say tormented, reader. He has, however, thrown considerable light upon a really important subject, and has evidently given much conscientious care to his work. That he did not know how to do it better, we are sorry; but we are grateful to him for having done it at all.

ORLANDO.*

NOT a few novelists begin their books in the flow of a happy inspiration with a rather brilliant dash, droop heavily in the meandering course of the story, and wind up with a lame and impotent conclusion. Miss Black, on the contrary, begins fairly well; but her performance surpasses her promise, and she ends far better than she began. Orlando, as we see him first, strikes us as somewhat of a stage-struck hero, with decidedly more sentiment than nerve and muscle. He is inclined to take his changing colours from the people and objects about him; he is the unresisting subject of those first impressions to which he shows himself singularly plastic; and while he has almost a superabundance of the diffidence of ingenuous youth, he seldom seems to be sure of his own mind. The fact is, we believe, that the author is as conscious of all this as her readers. She decided to try the hazardous experiment of developing her hero naturally from feeble youth into full-grown manhood. And it is certain that Orlando Sherborne, though he improves wonderfully under the discipline of life and the teaching of the blighted affections, remains to the last more or less true to early appearances. To the last he is carried away by his sympathetic impulses, and he is only saved from making shipwreck of his happiness by chances on which he had no right to reckon. This, however, though it may be false to the commonplace ideas of fiction, is a faithful picture of the ordinary human career, and Miss Black has woven an interesting and touching story out of simple and natural materials.

As must be almost invariably the case with lady novelists, she is much more at home with her women than with her men. Her women live and breathe in actual flesh and blood, while her men are inclined to be fantastic when they are not feminine. Two young ladies stand out conspicuously in her pages, and both are excellent in their different ways. Each in her turn has the opportunity of rising by the strength of disinterested love to the sublimity of self-sacrifice, and the one and the other show themselves equally generous. They are finely and delicately contrasted, too, in their temperaments, in their upbringing, in their lives and in their destinies. Elizabeth Glendinning first dazzles the fancy of the impressionable Orlando. She is a vision of all that is bright and beautiful, and her attractions are acknowledged by the most fastidious judges. Highly connected and highly accomplished, she is a woman that any man might be proud to mate with. So thinks Orlando, when he is struck with love at first sight, as in meditative mood he sees her for the first time under appropriately romantic circumstances. Her graceful figure goes gliding under the shady foliage of the grove in which he has been reposing of a summer afternoon. Forthwith he echoes the sentiment of the lover of Elaine in the *Idylls of the King*, "Here by God's grace is the one maid for me." So Miss Glendinning might have been, and would have been, but unfortunately she is already bespoken, and by the mockery of destiny had said the fatal Yes in the very hour when Orlando has lost his heart to her. She had been flattered into a precipitate mistake by the addresses, compliments, and condescending admiration of a brilliant scapegrace. Her heart, which deserves a more fervent response, warns her in the critical moment of the decisive interview that this plausible Captain Grove is altogether unworthy of her. A timely word of resolute retractation would have saved her from a world of misery; but the staunch loyalty of her nature makes her loth to draw back. And that same sense of constancy binds her in inextricable entanglement through a long course of wretched years. Her first forebodings are quickly confirmed, and she is speedily disenchanted of her passion for Grove as she loses all respect for him. She discerns only too clearly his shallowness and selfishness; nor does it need the outspoken criticisms of all her friends and relations to confirm her in her increasingly unfavourable opinion of him. He is not only a *roué*, but a dishonourable scoundrel. He borrows, or rather appropriates, great part of her fortune to pay his play debts. He taunts her at the same time with the injury she has done him in coming between him and the wealthy relative from whom he had great pecuniary expectations. He is sent abroad in confidential Government employment, and betrays the Government secrets to the newspaper press. The scandal compromises him openly in the eyes of the world, and his character is absolutely blasted. Still Miss Glendinning clings to him through good and evil report. More than once, in her hopeless disappointment and the intensity of her sufferings, she makes a plaintive appeal to his generosity, and prays him to set her free from her ill-considered promise. He gives her fresh proofs of his irredeemable baseness by appealing more earnestly than ever to her constancy and her humanity. Should she abandon him, his fate is sealed. But in any case it is all over with him, and only a question of time. He dies at last at Monte Carlo, where he has been leading a scandalously dissipated life under the very eyes of his lady love, paying her duty visits in her apartments at Mentone in the intervals of his debaucheries. Elizabeth Glendinning's chains are broken, and she hastens home to recruit her health and spirits. She has but a single hope left her on earth, and that hope she scarcely dare acknowledge to herself. She knows that Orlando Sherborne has remained a bachelor; she believes that her unlucky choice is the cause of the lonely existence which he has striven to occupy with the interests of the Sherborne property. And it is just possible that, faded in beauty and withered in heart though she is, the old passion may revive when he meets her under the old circumstances, and that she may make some tardy compensation for the mischief she has done him.

Unfortunately for Miss Glendinning, the situation is complicated by incidents which the author has worked out very artistically. Through the intervention of an artist friend, Orlando has made the acquaintance of a family of ladies in Gower Street into which the clever artist has married. As may be conceived from their selection of a residence in the neighbourhood of the London University and the British Museum, Mrs. Cash and her daughter are strong-minded women. We rather think she had a seat on the London School Board; at all events she has figured on public platforms, where she has spoken with equal eloquence and good sense. Her daughters, who are extremely well educated and accomplished, have taken after her as a matter of course. But the Cashes have achieved the difficult, if not the impossible, by being not only strong-minded but feminine and fascinating. When Orlando made acquaintance with Viola, the youngest unmarried daughter, we did not see how he could help falling in love with her. And as she was evidently disposed to respond to his attachment, we felt that, by all the traditions of fiction, it was she and not Miss Glendinning who was entitled to become the mistress in his ancestral halls. Their unconscious courtship down in the country is really very pretty; though we dislike Viola being introduced as talking School Board and taking a special interest in the schools Mr. Sherborne is building. When the staid and practical-minded young squire goes hunting for violets on his hands and knees on mossy banks in his damp coverts; when he leaves a basket of violets and heart's-ease tastefully arranged at Viola's door on the morning of her birthday, we feel, as she and her family do, that it really amounts to a declaration. If there is a marked trait in Orlando's character it is his honesty; by this time he has learnt to know what he wishes; and we are sure that he can hardly stop short under any circumstances. But it is at that moment, by one of the inscrutable caprices of Fate, that Captain Grove dies and Miss Glendinning returns. She is received in the house of Sherborne's married sister, where, by an untoward accident, he is visiting at the time; and he is constrained to take his share in the dangerous office of consoling the object of his early devotion. All things considered, we should have thought his wisdom would have warned him to steer

* *Orlando.* By Clementina Black, Author of "A Sussex Idyl." London: Smith, Elder, & Co. 1880.

clear of *tête-à-têtes*, to avoid meetings of the eyes, and to limit his speech to sympathetic generalities. But there comes in that touch of consistency with his early character which we have already referred to. Had he taken the pains to search into his heart, he would have assured himself that his happiness was bound up in Viola Cash. Elizabeth Glendinning, pale and sorrow-stricken, is merely the phantom of a vanished passion. But that pale face of hers, and her desponding utterances, stir his sympathetic nature irresistibly. Hope tells her a flattering tale when she sees how deeply he feels for her. Going out of his way to meet her alone in a London garden, he confirms her in her self-deception out of sheer pity, and renews the offer he made so many years before. In the brightening prospect of opening vistas of happiness Miss Glendinning jumps at the offer, metaphorically speaking. Orlando realizes the whole measure of his mistake—or, in other words, he feels what a fool he has made of himself—when he next finds himself face to face with Viola. His self-apology had been that it was only his own happiness he had been sacrificing; that Viola was unconscious of an affection which he had never expressed in language. She betrays her feelings only too clearly with her accustomed candour; and, as he cannot leave her without a word, they come to an explanation. It is a question of the niceties of our mental constitution how far she was likely to have received his lame explanation uncomplainingly, not only condoning his conduct, but approving it. It is a question of casuistry how far she was justified in urging him to persist in marrying one woman while he was hopelessly devoted to another. Be that as it may, no great mischief is done. Miss Glendinning fortunately happens to discover that she is trembling on the brink of a second mistake, and is in a fair way to complete the ruin of the life of the man whom she has already caused to suffer so deeply. We may say of Orlando that "all's well that ends well"; and we part, after all, on pleasant terms with the personages of a clever and entertaining novel.

BELLS.*

THE recent extraordinary outburst of books on bells would tempt a joker to say that a new branch had been added to *belles lettres*. It is not long since we reviewed a couple of stout volumes on the subject, and no fewer than four claim our attention again already. Three of them are very serious works indeed, and partake rather of the character of scientific or mathematical treatises than of light literature. Mr. Lomax's little book is a mere compilation from other authorities, but very pleasantly written, and gives a brief yet sufficiently complete account of the subject for people who do not want to take it up as a pursuit. All these three, however, deal as much with the musical as with the antiquarian aspect of bells; but Mr. North's volume—full, careful, and accurate as it is, for the most part—only describes the appearance and age of the Northamptonshire bells, with no account of their notes or pitches. This is a defect which might easily be remedied. There are many scientific musicians among us who have long been engaged on musical tone, and on the gradual growth of the present diapason; and to them it would be very important, where the date of a bell is known, to be able to ascertain its exact pitch. Unfortunately, this has yet to be done for the few uncracked mediæval bells which have remained in our church towers; but when we remember that, as musical instruments, bells are far older among us than organ pipes, their value as ancient evidence will at once appear. After all, however, it is strange how modern even the oldest bells are; for the first Englishman known to have been a bell-founder by trade lived in 1284, when he made four bells for the cathedral church of Exeter, none of which remain; and one which is dated 1296 is the most ancient identified in England. The oldest bell mentioned by Mr. North as still hanging in a Northamptonshire steeple is that of Cold Ashby, which bears the date 1317; but there are many undated examples which, from the style of the inscriptions, must be considerably older. One hundred and thirty-seven in all may be said with certainty to have been cast before the commencement of the seventeenth century, and of these twenty-three are dated. In Leicestershire Mr. North found one hundred and forty of the early period; so that there is only a difference of three old bells between the two counties, a curious coincidence. But Northampton does not seem to have boasted of a bell-founder till the end of the sixteenth century, being thus about a hundred years later than Leicester. Moreover, many of the Northamptonshire bells were made by Newcombe of Leicester, the two which hang beside "Maria" at Cold Ashby being by him, with the inscription, "Newcombe of Leicester made mee 1606."

The curious local customs of which Mr. North has recorded so many may be illustrated by the quotation from Bridges, who says:—"Part of the land on which the Vicarage house was built is taken out of the land belonging to the Rectory, and, to enlarge the premises, an addition was made of some town ground; in consideration of which every Vicar finds bell ropes at his own charges." Anecdotes like this occur under the name of nearly every parish in Mr. North's volume, and greatly enliven what is at best but an inventory. Thus we read of Anthony Catesby of Whiston in the reign of Henry VIII. that, in conjunction with his wife and son, he built Whiston Church, but that his money was exhausted before the bells were hung. To provide them he sold a flock of sheep, and, when he heard the sound of the chimes coming across the valley, he said to his wife, "Do you hear how my lambs are bleating?" Mr. North points out that a very similar story is told of Zitholf of St. Albans, who is said to have built the belfry with the price of his flocks. Here is an example suited to the Society for repressing restoration. At Longthorpe the bell was taken down with the intention of rehanging it in the new tower then about to be erected. "Unfortunately, when the new tower was completed, it was found too small to contain the bell," which was sold to a local ironmonger and a smaller bell bought. The sequel is also instructive: "After a time the old bell passed into the hands of Mr. Johnson, who presented it to the Roman Catholic chapel at Peterborough." Among the Northamptonshire bells there is but one bearing a figure. At Stanion the fourth bell has on it a relief of the Virgin and Child. Of rhymes Mr. North gives many, but few worth quoting, and some are rather profane; for instance:—

> Pull on, brave boys, I'm metal to the back,
> But will be hanged before I crack.

But most of the couplets are like this one at Kingsthorpe:—

> Robert Atton made me
> The treble bell for to be. 1621.

There is not a trace of poetry in any of them. In Ashover Church, in Derbyshire, there is, according to Mr. Lomax, this inscription on a bell, which we presume was shortly recast:—

> This old bell rung the downfall of Buonaparte, and broke, April, 1814.

We are not told whether it was recast in time to ring the same personage's second downfall in the following year. Political events are mentioned on other bells in various places. Mr. Lomax is mistaken in saying that the inscription on the St. Mary's bell at Oxford has not been deciphered. When we reviewed Mr. North's former volume (15th of April, 1876), we had occasion to quote some notes in which he informed us that the bell was cast at Leicester, by the famous Newcombe, in 1612, and that Dr. Rimbault considered the madrigal tune written round it to be somewhat in the style of a well-known glee, "In Going to my Lonesome Bed." Both at Hove, near Brighton, and at All Saints, Northampton, the foolish rhymes occur:—

> I mean to make it understood
> That though I'm little yet I'm good.

Mr. North apparently does not approve of change-ringing among old bells, which are more precious to him for their appearance than their sound. Its introduction in the seventeenth century produced, he considers, more havoc amongst ancient bells than did even the Reformation. He speaks at some length of the great popularity of the ringer's art, and quotes an old writer who says, "I have known more than one of my countrymen who would undertake more travel and cost besides to hear a peal of grandsires, than they would bestow upon a generation of grandchildren." If any one wishes to know what a peal of grandsires is, he may be referred to Mr. Snowdon or Mr. Lomax. Mr. Snowdon is, in fact, so learned in his *Treatise on Treble Bob* that we must be satisfied with the briefer account of Mr. Lomax, though readers who do not understand such things will not find it very simple:—"When we have five bells to ring, a plan known as 'grandsire' is adopted. The reader will have seen that hitherto the treble has hunted throughout, and has been the only bell which did so; whereas now another bell shares in the same privilege." Then, clearly, to know what a grandsire is we must find out what "hunting" is. Mr. Lomax explains the word at some length:—"The object of all systems of changing is to use up all possible permutations, without repetition or omission. . . . Hunting is when the bell takes each place in succession, striking twice at the lead and twice when behind. In the following example:—

```
1 2 3 4 5
2
2
3
3
4
```

1 hunts *up* the whole way and 4 hunts *down* for all the changes, except the first or 'round.'" Several pages of similarly recondite matter follow, until at last the "Grandsire" is reached. But the technical terms of change-ringing are many and strange. The whole title of Mr. Snowdon's book, for instance, is "A Treatise on Treble Bob, containing the history of treble bob; with an explanation of the in and out-of-course of the changes; the mode of pricking touches and peals; the qualities and mode of transposing peals; with elaborate instructions for proving peals; and an explanation of Lockwood's system of composition, and hints on conducting and calling round."

Verily, as Mr. North quotes from Southey, "great are the mysteries of bell-ringing." Three bells can ring six changes thus:—

```
1 2 3
1 3 2
2 1 3
2 3 1
3 1 2
3 2 1
```

---

* *The Church Bells of Northamptonshire.* By Thomas North. Leicester: Clarke.

Bells and Bell-Ringers. By Benjamin Lomax. London: Infield.

The Change-Ringer's Guide to the Steeples of England. By J. E. Acland-Troyte and R. H. D. Acland-Troyte. London: Gardner.

A Treatise on Treble Bob. Parts 1 and 2. By J. W. Snowdon. Leeds: Old Bank Chambers.

Four bells can ring twenty-four changes, five bells one hundred and twenty, and "it has been calculated that it would take ninety-one years to ring the changes upon twelve bells, at the rate of two strokes to a second; and the full changes upon twenty-four bells would occupy more than 117,000 billions of years."

The *Change-Ringer's Guide* is rather a topographical than a campanological work. It gives the names of Societies and steeples where change-ringing is practised, arranged alphabetically in counties, together with the days on which there is regular bell-ringing, the name and address in each place of one person who is willing to give information on the subject, and the nearest railway station. The book, which is small enough for the pocket, will of course be indispensable for any one who, "staying or travelling away from home, is anxious as ever to pursue his favourite exercise, yet has no means of finding out when or where he can get a pull." In an appendix is added from *Church Bells* a "form of service for the dedication of a peal," together with many other items of information and instruction. We gather from it that the Westminster clock chimes are supposed to have been adapted from a phrase in the opening symphony of "I know that my Redeemer liveth," in Handel's oratorio of the *Messiah*. There is also a list of the big bells of Europe, from which it appears that Big Ben is eighth in order of size, three at Moscow, one at Novogorod, one at Cologne, one at Olmutz, and one at Vienna being all larger. The famous, but now broken bell at Moscow, cast in 1734, weighs 220 tons, and is 22 feet 8 inches in diameter. The great bell of St. Peter's at Rome is only 8 tons in weight, and the great bell of St. Paul's, London, 5 tons 4 cwt. The largest in England after Big Ben is Great Tom of Oxford, which is 7 feet in diameter, and weighs 7 tons 12 cwt. Great Tom of Lincoln, cast in 1835, is 6 feet 10½ inches in diameter and weighs 8 cwt. more than the heaviest bell at St. Paul's.

MINOR NOTICES.

"THE tragic drama of *Angelo*," says Mr. Coe in the prefatory remarks which precede his version of that great work (1), "is one in which I have always felt an unquestionable interest." It is likely that few people would be disposed to question the interest felt in this play by Mr. Coe or by any one else, and it was perhaps unnecessary that he should explain that the cause of his interest probably lay in the fact that *Angelo* was "the first work by Victor Hugo that I had in my youth the pleasure of seeing represented at the Théâtre Français." Mr. Coe goes on to observe presently, with obvious truth, that "Victor Hugo's drama, poetical in spirit, is nevertheless written in prose." It is not altogether abnormal for the prose works of great writers to be "poetical in spirit," and Mr. Coe, who has thought fit to turn M. Hugo's prose into "English blank verse," has given a fresh proof, if any were needed, that it is possible for that which is intended for poetry to be excessively prosy. Let us take at once one of the earliest fine speeches in the play, and see what Mr. Coe's transmogrification makes of it. La Tisbe gives some account of her early life in these words:—

> Non, tenez, je suis bonne, voilà l'histoire. Vous savez qui je suis? rien, une fille du peuple, une comédienne, une chose que vous caressez aujourd'hui et que vous briserez demain. Toujours en jouant. Eh bien? si peu que je sois, j'ai eu une mère. Savez-vous ce que c'est que d'avoir une mère? En avez-vous eu une, vous? Savez-vous ce que c'est d'être enfant? pauvre enfant, faible, nu, misérable, affamé, seul au monde, et de sentir que vous avez auprès de vous, autour de vous, au-dessus de vous, marchant quand vous marchez, s'arrêtant quand vouz vous arrêtez, souriant quand vous pleurez, une femme—non, on ne sait pas encore que c'est une femme—un ange qui est là, qui vous regarde, qui vous apprend à parler, qui vous apprend à rire, qui vous apprend à aimer! qui vous réchauffe vos doigts dans ses mains, votre corps dans ses genoux, votre âme dans son cœur! qui vous donne son lait quand vous êtes petit, son pain quand vous êtes grand, sa vie toujours! à qui vous dites "Ma mère!" et qui vous dit "Mon enfant" d'une manière si douce que ces deux mots-là réjouissent Dieu!

This, the masterly opening of a most stirring and powerful speech, is thus rendered by Mr. Coe:—

> Nay, nay, I will be docile;
> Here is the history. You know that I,
> Comedian, child of the people—something
> To be caressed to-day, despised to-morrow,
> As it may please my masters—even I,
> Low as I may have been, had once a mother.
> Great lord, have you had one? Knew you what 'twas
> To be a child? A poor child, weak and famished,
> Naked, and miserable in the world,
> And feel that you had near you and around you,
> Ay, and above you, walking when you walked,
> When you stopped, stopping, smiling when you smiled,
> A woman? No, the child knows not that 'tis
> Even a woman. 'Tis an angel that
> Looks down and smiles; from whom we learn to speak,
> From whom we learn to sing, to laugh, to love;
> Who warms us with her warmth, who near her heart
> Enfolds our feeble form, feeds with her milk,
> Bestows her health, her life, whom we call *mother*,
> Who calls us *child*—sweet sounds that angels hear
> With tears of joy.

Mr. Coe's reason or excuse for this flabby and incorrect paraphrase in what is meant for blank verse of M. Hugo's splendid prose, and for many others like unto it, is that, "as it is notoriously difficult in a translation of art literature from one tongue into another to reproduce the whole spiritual life of the original, I conceived that I could fairly seek some compensation in adopting a rhythmical flow of language that might fall more or less melodiously on the ear." It is unfortunate that Mr. Coe's "rhythmical flow of language" flows rather less than more melodiously on the ear, and, so far from reproducing "the whole," does not reproduce any touch of the "spirit and life of the original." But when we read, a little later on, his dictum that, "although I am aware their professors of rhetoric claim for French verse a rhythm, it possesses in reality only a metre, and has no natural rhythm or cadence, like that which belongs innately to the English language," we feel that we have no further right to be astonished at anything which Mr. Coe may say or do. It is at any rate only consistent with this that he should quote with unmeasured approval, and even enthusiasm, these astoundingly uninstructed remarks made by an English critic *à propos* of the performance of *Hernani* given in London last year by the Comédie Française:—"There is an immense obstacle to the appreciation of a French rhymed serious play in the declamation of the actors, which, however skilfully managed, has, to English ears, a monotony of rhythm which wearies, while it largely interferes with the accent of passion. In fact (the italics are ours) *it seems to Englishmen that it is by accident when the emphasis in French stage declamation falls on the emphatic word.*" After one has read Mr. Coe's prefatory remarks and some portion of his version of *Angelo*, it becomes a matter of absolutely no moment that he has chosen to reconstruct M. Hugo's fourth act.

To the surprise, as we should imagine, of all upon whose hands time has not for the last few years been hanging heavily, the decennial Ober-Ammergau Passion Play is on us again (though, to be sure, after only nine years' interval), and with its recurrence have come new editions of the three admirable handbooks prepared upon the last occasions by Mr. MacColl (2), Mr. Oxenham (3), and Mr. Blackburn (4). Our advice to all who have money to spare for a holiday, in spite of the hard times and of the general election, is not to miss the opportunity of beholding, while yet it flourishes undeteriorated, this unique spectacle—reverent, artistic, and picturesque as it is in itself and in its accessories—and we further advise them to slip these thin volumes into their pockets or portmanteaus. Mr. MacColl and Mr. Blackburn supplement their former descriptions with some timely information as to the arrangements for the present season. The twenty-four representations are to run from Whitsun Monday, May 17, to September 26. In looking at the list of performers we find that, as in 1870-1, so now, Mair is the Christus; Zwink, St. John; Hett, St. Peter; Lechner, Judas; J. Lang, Caiaphas; and Diemer, Choragus. All who remember the last occasion will welcome this as good news. Only—why we know not—the stately presentment of Pilate by Flunger (the Christus of 1850) is replaced by Thomas Rendl, who on the last occasion personated Joseph of Arimathea. Both the Virgin and St. Mary Magdalene are placed in new hands, which is not to be regretted, as their former representatives certainly did not add strength to the performance. The venerable rustic who esteemed it a privilege to appear in dumb show as Barabbas is again to be indulged. Mr. Blackburn's illustrative portraits reproduced in this edition are those of the actors of 1870-71. A permanent theatre has in the intervening time been built to hold 4,500 spectators, in lieu of the old scaffoldings, but we are glad to read in Mr. Blackburn's preface that, "it is interesting to learn from private letters that the worthy inhabitants of Ober-Ammergau are preparing for their work in the same earnest devotional spirit as in 1870, and that they were in no sense demoralized by the popularity of the last performances." The railroad from Munich, which stopped at Weilheim in 1871, has now been continued to Murnau.

Miss Tuckey, in the latest volume of the New Plutarch Series, tells the story of Joan of Arc's (5) life and deeds. Miss Tuckey has studied her subject long and carefully, and writes with fervour. The volume has much interest, and its writer's enthusiasm has not prevented her from telling her story plainly and succinctly.

Mr. Lanier, who dates his preface from Baltimore, Md., may be congratulated on the manner in which he has carried out his capital notion of preparing an edition of some of Froissart's Chronicles (6) for boy-readers. His introduction is excellent both as to its tone and with regard to the manner in which he has expressed himself. There is no affectation, and no suspicion of writing down to his readers. The author says things which can hardly be said too often in plain, fresh, and manly language, which will at once enlist the sympathy of his readers. The illustrations have a good deal of dash.

Mr. Shaw, in the preface to his useful and convenient little

(1) *Angelo: a Tragedy.* By Victor Hugo. Rendered into English Blank Verse, with Explanatory Notes and some Prefatory Remarks on French Dramatic Poetry, Past and Present, by Ernest Oswald Coe. London: David Stott.

(2) *The Ober-Ammergau Passion Play.* Reprinted, by permission, from the "Times." By the Rev. Malcolm MacColl. New and Revised Edition. London: Rivingtons.

(3) *Recollections of Ober-Ammergau in 1871.* By Henry Nutcombe Oxenham. London: Rivingtons.

(4) *Art in the Mountains: the Story of the Passion Play.* By Henry Blackburn. With numerous Illustrations. London: Sampson Low & Co.

(5) *The New Plutarch.—Joan of Arc.* By Janet Tuckey. London and Belfast: Marcus Ward & Co.

(6) *The Boy's Froissart; being Sir John Froissart's Chronicles of Adventure, Battle, and Custom in England, France, Spain, &c.* Edited for Boys, with an Introduction, by Sidney Lanier. Illustrated by Alfred Kappes. London: Sampson Low & Co.

volume (7), points out with truth that, while it is possible to ascertain the methods adopted by private gardeners, market gardeners want either the time or the inclination to make any written record of their practice. Mr. Shaw's object has been to supply the deficiency here indicated, and we hope with him that his book may be "the means of enabling people to obtain more and better flowers, fruits, or vegetables from their gardens than they have hitherto done."

Mr. Glenny's object has been to show (8) how an amateur may "dispense with the skilled labour which is often difficult, and sometimes impossible, to obtain." An amateur in any business who can succeed in doing this must have somewhat unusual capacities; but certainly Mr. Glenny's instructions are as clear and concise as possible.

Dr. Lumby's edition of the *Utopia* (9), which includes William Roper's Life of More, is of course admirably got up and printed. The introduction is good, and the notes are for the most part well considered. We find one very odd derivation in p. 195. "*Pardy.* A corruption of the French pour Dieu." *Par* Dieu, the obvious derivation, is of course the right one. Littré gives "Pardi ou Pardine, *int. fam.* Altération de pardieu." The only possible excuse for Dr. Lumby is that *Pardi* is not given in the Dictionary of the Academy.

We cannot attempt in a short notice to do full justice to Mr. Anderson's valuable and exhaustive work on Lightning Conductors (10). We must be content, for the present at least, with pointing out that the work is written in a clear and agreeable style, and that no pains have been spared in consulting authorities and collecting statistics.

No one could well be better fitted for the task of translating Herr Wagner's *Beethoven* (11) than Mr. Dannreuther, and musicians, whether of the Wagnerian or anti-Wagnerian school, who prefer reading English to reading German, should be grateful to him for having undertaken it. The care and conscientiousness of Mr. Dannreuther's work can best be illustrated by a reference to one or two of his foot-notes. Thus in p. 17, on the passage, "Our consciousness which only in gazing at a semblance is enabled to grasp the idea manifested by it," we have the foot-note, "'Im Schauen des Scheines,' literally 'In the seeing of a sheen'"; and again, in p. 37, the passage "the fettered demon of music playing before us with the childishness of one born an old man," is illustrated by the note, "'Mit der Kindlichkeit eines geborenen Greises vor uns spielen.' Childishness in English conveys rather more than is intended by 'Kindlichkeit.'" Whether Herr Wagner is right in thus describing Haydn's instrumental music need not be here discussed.

Mr. Carlos's excellent translation of the *Sidereal Messenger* (12) is the result of his having been engaged some time ago in cataloguing the old books belonging to Christ's Hospital. Among these was a volume, printed in 1653 in London, containing, amongst other things, Galileo's *Siderius Nuncius* and Kepler's *Dioptrics.* Mr. Carlos found Galileo's account of his discoveries so interesting that he took up its translation as a recreation from school work, and there is little doubt that his readers will share the interest which he himself felt in it.

Many people who read Mr. Sturgis's *Little Comedies* (13) as they came out in *Blackwood's Magazine* will welcome their reappearance in a collected form and in a prettily got up volume. Mr. Sturgis's writing is light and graceful. His characters are lifelike, and his dialogue is never strained or wearisome. He has what used to be called "a pretty turn" for poetry. It is almost impossible to make a quotation from any of the delicate little scenes without spoiling it by separation from its context; but we must hazard one from *Fire-Flies*:—

Bino. You will scorn me, as you are a woman. But stay. I am possessed by the God. Now the divine madness works. You draw poetry to you, lady, as the moon the tide. Hush!

> O dainty mask, like our Italian night,
> Most beautiful, and hiding all but stars,
> Whose is the face thou hidest from my sight?
> —Would I could find some other rhyme than "wars."

May wars never come between us.

Bice. My lips were not the first to frame the word.

Bino. Thy lips should frame things sweeter than mere speech.

Bice. I know no rhyme more gracious than, Absurd!

Bino. And I no rhyme less terrible than, Breach!

Bice. In truth, I fear you are but a camp-singer, for war and breach come quickest to your lips. You are no poet for a lady's chamber, to conjure a nap before dressing-time. Rather you should swagger in camp, and be clapped on the shoulder by comrade This and comrade That, with, "A draught of wine, my lad!" or, "A rousing song, my boy!" Ah, if you should be less a poet than a swashbuckler!

Bino. For it's ho! wine ho!

> And give me a flagon of wine,
> Till here and there I go,—what ho!
> And reeling to and fro,—what ho!
> Feel all the world is mine.

Bice. A kitchen-wench would cry "Good" to those lines. They are well enough to call a tapster—what ho!

Bino.

> O lady of the starry eyes,
> O lady of the bitter tongue,
> Lips should be taught more sweet replies,
> While you and I are young.

The miniature edition of selected poems from Wordsworth (14) published by Messrs. Kent is very prettily got up, and printed with admirable clearness. The selections seem to us to have been made with great judgment.

Mr. Infield's novel compilation (15) has much to recommend it. It preserves the most weighty political speeches of the day, giving in the more important passages the *ipsissima verba* of the speakers; it maintains a strict impartiality, and gives the date of every incident, and a reference to the source of its report whenever the matter has not been common to the whole of the daily press; and its usefulness is completed by a full and well arranged index.

Mr. Morris has republished in a little volume a number of letters contributed by him during the last seven years to the *Times* (16), mostly on the subject of birds. The first letter of all, written in 1873, protests against the cruel traps set on the tops of poles, artfully placed so as to seem a convenient alighting place to flying owls and hawks. The practice, it is to be feared, is still too common; and we can only hope that Mr. Morris's volume may do something towards suppressing it.

Miss Bell's translation of Herr Ebers's novel (17) is smooth and, as far as style goes, readable enough; but unfortunately the matter with which she has had to deal has little real life in it.

The same firm issues a translation, by Mr. Macdowall, of Herr Reuter's *Ut mine Stromtid* (18), a work which is likely to be more popular than Herr Ebers's learned attempt to bring dry bones to life.

Mr. Kent's translation of *Le Cousin Pons* (19) is for the most part both spirited and accurate, and he has wrestled successfully with the turning of Schmucke's German-French into German-English. It is perhaps doubtful whether people who do not read Balzac in French will care to read him in English.

The Year (20), written for and produced at the Bradford Musical Festival in 1859, like so many works given at provincial musical meetings, attracted some notice at the time. The libretto is a compilation from the works of various poets, and it is much to the credit of the composer that he should have made so pleasing a cantata from the materials before him. When we say that it is an amalgam of Pope, Thomson, Hood, Cowper, and Chorley, we think we have said enough as to the difficulty of his task. With Haydn's *Seasons* ringing in our ears, a work built upon the same lines must naturally be somewhat handicapped, though the *Seasons* is by no means in the first rank. Still Mr. Jackson's work is one which the public must thank Messrs. Novello for keeping before them.

Miss Smith's unpretentious little cantata (21) is by no means so unpleasant as its title would imply. It is true the boyish vigour of Charles Kingsley may have led him to cry

> Welcome, black North-Easter,
> O'er the German foam!

but the generality of mortals will hardly echo his sentiments. The cantata, however, is an artistic little production, written with much judgment and giving evidence of thorough musical training. The chorus "Let the luscious south wind" is especially pleasing. Amateur choral societies cannot fail to appreciate its value.

M. Silas's work is always artistic, and though the present production (22) is no novelty, it is by no means the less welcome. It has already stood the test of professional criticism, being the work selected at the Belgian International Competition of Sacred Music in 1866 as worthy of the first prize. Aiming at no special originality of treatment, M. Silas has invested it with an interest peculiar to himself, and of which we would fain have more. The vigorous "Gloria," the plaintive "Incarnatus," and the graceful "Ave Maria" are all effective, whilst the "Tantum ergo" is in its way as pleasing a piece of sacred music as could be wished for.

Miss Glaister's little book will be much appreciated by those who love high-art needlework (23) and have not the opportunity of cultivating their tastes and increasing their knowledge by going to exhibitions of art needlework, interchanging ideas on the subject with fellow-artists, and getting hints from the many decorated drawing-rooms of the present day. Chapters IV. and V. contain many beautiful descriptions of curtains and valuable advice as to design and colouring; in fact, the whole book sets forth simply and practically the poetry and prose of decorative needlework.

(23) *Needlework.* By Elizabeth Glaister. Art at Home Series. London: Macmillan.

CONTENTS OF No. 1,276, APRIL 10, 1880:

CONTENTS OF No. 1,275, APRIL 3, 1880:

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

ROSSALL SCHOOL.—ENTRANCE SCHOLARSHIPS.—TWELVE to be competed for, June 29. Value, from 70 Guineas (covering School Fees) to £30. Ages, under 14½ and 15½. Candidates may be examined at Rossall or Oxford, as preferred, in Classics or Mathematics.—Apply to Rev. the HEAD-MASTER, Rossall School, Fleetwood.

SOMERSETSHIRE COLLEGE, BATH.—An EXAMINATION will be held on June 29 and 30, to elect to Seven Entrance Scholarships.—T. M. BROMLEY, M.A., Head-Master.

BATH COLLEGE, BATH.
CLASSICAL AND MATHEMATICAL SCHOLARSHIPS.
President—His Grace the Duke of CLEVELAND, K.G., D.C.L.
Head-Master—T. W. DUNN, Esq., M.A., late Fellow and Assistant Tutor of St. Peter's College, Cambridge; and for ten years a Master in Clifton College.
Honorary Secretary—Sir HENRY FREELING, Bart.
Four or more ENTRANCE SCHOLARSHIPS will be offered for Competition, on Wednesday and Thursday, September 15 and 16, 1880, value from £25 to £50, to be increased to £60 in case of a scholar who needs it. The Examiners will allow for age in the case of younger Boys, and will also recommend meritorious Candidates for Free Nominations.
The HEAD-MASTER can provide for Candidates from a distance during the Examination.
The Midsummer Term begins on May 1.

MALVERN COLLEGE.
The NEXT TERM will begin on Monday, May 3.

ISLE OF WIGHT COLLEGE.
The NEXT TERM will commence at Nine o'clock on Friday, April 30.
Head-Master—Rev. F. PENTHREATH, D.D.
All particulars from J. W. FARDELL, Secretary, Cambrian House Offices, Ryde, Isle of Wight.

DOVER COLLEGE.—Board, £46 6s. Tuition, from Thirteen to Eighteen Guineas. The NEXT TERM will commence on April 21.—Apply to the Rev. W. BELL, M.A., the Head Master; or W. KNOCKER, Esq., the Honorary Secretary.

CARSHALTON HOUSE SCHOOL, Surrey.—BOYS carefully prepared for Civil and Military Examinations.

LANCASTER SCHOOL.—NEXT TERM begins on May 6.
WILLIAM E. PRYKE, M.A., *Head-Master*.

BRUCE CASTLE, TOTTENHAM. Thirty minutes from Liverpool Street. *Head-Master* Rev. W. ALMACK, M.A.
BOYS of all ages educated for ordinary pursuits or any particular Examination.
Special arrangement for those under Ten. School-house and grounds of exceptional healthiness and beauty.

ABINGDON SCHOOL, Berks.—Additional Buildings, comprising Class-rooms, Studies, &c., will be ready for next Term, commencing May 4.—For entrance, apply to the Rev. E. SUMMERS, Head-Master.

BOURNEMOUTH.—CHELTENHAM HOUSE (facing the Sea).—J. WILLIAM WILLIAMSON, M.A., Oxford, receives a limited number of BACKWARD and DELICATE BOYS, to Prepare for the Public Schools or for general Education.—Full particulars and prospectus on application.

EDUCATION.—Rev. W. TUCKWELL, late Head-Master of Taunton College School, and Fellow of New College, Oxford, takes a few Boys as PUPILS.—Address, Stockton Rectory, near Rugby.

KINGSBRIDGE GRAMMAR SCHOOL, SOUTH DEVON.
Head-Master—D. F. RANKING, M.A. Oxon.
Second Master—J. A. SHEAL, M.A. Cantab.
Three Exhibitions of £30 for Three Years. Inclusive Fees, £50.
NEXT TERM begins May 3.

PREPARATION for the PUBLIC SCHOOLS.—Morning and Afternoon CLASSES for the SONS of GENTLEMEN only. The NEXT TERM will begin on Monday, April 19.—57 Cambridge Street, Hyde Park, W.

TOURS, FRANCE.—Rev. C. DOWMAN, LL.B. (Mathematical Honours), late Tutor in Nobleman's family, receives PUPILS for Woolwich, Sandhurst, and Line, *viâ* Militia, Universities, and for General Education. Able staff of Masters. Individual attention and careful moral supervision. Very successful at late Examinations. Large house and pleasure grounds.—Address, Beau Séjour.

KING ALFRED'S SCHOOL, WANTAGE, Berks.—An Ancient Foundation. Buildings spacious and modern, in a healthy district. Thorough EDUCATION for the SONS of GENTLEMEN. Fees moderate. Boys prepared for Commerce, the Professions, and the Universities.—Address, HEAD-MASTER.

THE GRANGE SCHOOL, EWELL, Surrey.—Charterhouse; FIRST SCHOLARSHIP, 1879.—Resident English and Foreign Masters; liberal diet; healthy site; moderate terms. *Principal*—C. D. ALEXANDER, M.A., Cambridge.

DELICATE BOYS.—Some Parents can recommend, as PRIVATE TUTOR, an Oxford Graduate, who receives, in a charming country house, a few GENTLEMEN'S SONS requiring especial care.—Address, S. B. M., Messrs. Deighton & Co., Worcester.

HOME and SCHOOL for INDIAN CHILDREN. Recommended by the Rev. Dr. JEX-BLAKE, Head-Master of Rugby, and by Mrs. JEX-BLAKE.—Apply, 77 Avenue Road, Regent's Park, N.W.

THE Misses A. & R. LEECH'S SCHOOL for LITTLE BOYS will RE-OPEN Tuesday, April 13, at 65 Kensington Gardens Square, Hyde Park, W.

SCHOOL for LITTLE BOYS, at 3 Orchard Street, Portman Square.—The SUMMER TERM will begin on Monday, April 12, at 9.15 A.M. Mr. EDWARD BLAIR and Mr. FRANCIS TURNER will be at home after the 8th.

AT WIMBLEDON COMMON.—A LADY of Position wishes to recommend to Parents and Guardians a High-class EDUCATIONAL HOME, where some of her young relatives have been educated, and where they have enjoyed all the comforts of a refined home, combined with the highest educational advantages. She, as well as other Parents (who can also be referred to), cannot speak too highly of it. The Education is conducted entirely by eminent English and foreign Professors, assisted by resident Governesses. Only young ladies of good social position received.—Address, Hon. Mrs. S., 11 390, Address and Inquiry Office, "The Times" Office, E.C.

ENGLISH ALPINE HOME.—Temporary or permanent RESIDENTS are invited to join an English circle, in a villa situated in a locality called the most beautiful in the world. English and native Educational Establishment adjoining; chef; from 30s. a week. Private port and splendid fishing.—Address, M. R., Clos du Lac, Clarens.

ENGLAND to AUSTRALIA in FORTY DAYS.
ORIENT LINE.
The following or other magnificent full-powered Steam Ships belonging to the ORIENT and PACIFIC STEAM NAVIGATION COMPANIES, are despatched every FORTNIGHT for Adelaide, Melbourne, and Sydney, taking Passengers at through rates to all the principal port in Australia, Tasmania, and New Zealand.

	Tons.	H.P.		Tons.	H.P.

PIESSE & LUBIN, 2 NEW BOND STREET, LONDON.

PEARS' TRANSPARENT SOAP.
"The most refreshing and agreeable of balms for the skin." Professor ERASMUS WILSON, F.R.S. Vide "Journal of Cutaneous Medicine."—A. & F. PEARS, Soap Makers, by Appointment, to H.R.H. the Prince of Wales. Sold by Chemists and Perfumers everywhere.

PEARS' TRANSPARENT SOAP.
The Senior Surgeon at St. John's Hospital for the Skin, Mr. JOHN MILTON, writes, in his important work on "The Hygiene of the Skin" (Published by Messrs. Chatto & Windus, Piccadilly):

PEARS' TRANSPARENT SOAP.
"After fifteen years' careful trial, in many hundreds of cases, both in hospital and private practice, I have no hesitation in giving my verdict to the effect that nothing has proved so beneficial to the Skin as PEARS' TRANSPARENT SOAP. I have excellent reason to think it is the best, because

PEARS' TRANSPARENT SOAP.
"It is the purest Soap that is made, an opinion not only attested by the late Mr. STARTIN, by Professor ERASMUS WILSON, and by the late Dr. TILBURY FOX, but vouched for by the strictness of chemical analysis. So effectually has the process of purification been carried out, that this Soap may be used even to a surface abraded by Eczema."

PEARS' TRANSPARENT SOAP.
"I always use it myself and recommend to my patients PEARS' TRANSPARENT SOAP, in preference to any other, as being more free from excess of alkali and other impurities prejudicial to the skin."—The late eminent Surgeon, Mr. JAMES STARTIN. Sold everywhere.
By Appointment, Soap Makers to H.R.H. the Prince of Wales, 91 Great Russell Street, London, W.C.

PORTUGAL.—PORTUGUESE LIGHT WINES.

EL REI.—ROYAL BUCELLAS HOOK.
A Portuguese light Wine without brandy; is a White Wine made from Rhine Vines transplanted into Portugal. Possesses more character and fulness than other light wines, largely consumed in Portugal, does not deteriorate when uncorked, makes an agreeable and wholesome Summer Drink, combines particularly well with all aërated waters, and makes a delicious cup without addition of liqueurs. Maintains its character in all climates, and is a cheap wine. Of Wine Merchants and Dealers throughout the Kingdom.

LOTS 110 and 111.—Lot 110, Very Soft OLD PALE SHERRY, at 30s.; and Lot 111, Very Soft OLD OLOROSO SOLERA, Pale Gold, at 33s. per dozen. Sherries of the old style, mellowed by age, very soft, and entirely free from the fieriness which has been so detrimental to the consumption of Sherry. These exceptionally large lots are placed in the hands of the Association for forced realisation, and are offered to the public while on the Special Lot List at greatly reduced prices, instead of being sold by Auction.
THE LONDON CO-OPERATIVE WINE ASSOCIATION (Limited), 12 and 13 John Street, Adelphi, W.C. (removed from 446 Strand).

EUGÈNE CLICQUOT'S OLD CHAMPAGNE.—Two generations' experience of this celebrated Wine encourages JAMES CAMPBELL, 158 Regent Street, London, to recommend it as the best for England, India, and the Colonies. Price £3 3s. per dozen.

THE ELECTIONS.

WITH the exception of the Scotch Universities and of the remote Orkney Islands, all the constituencies have now returned their members. There have, therefore, been returned 649 out of 652 members, and the members returned consist of 351 Liberals, 236 Conservatives, and 62 Home Rulers. The Liberals have thus a majority of 53 over Conservatives and Home Rulers combined. But the occasion on which all Home Rulers and all Conservatives would unite is very difficult to conceive. The more violent section of the Home Rulers will probably vote against a Liberal Government, as it would vote against a Conservative Government. The moderate section will either vote with a Liberal Government or abstain from voting. The pending Scotch elections may probably result in the return of one Conservative and two Liberals. The position of parties in the new Parliament will therefore be that the Liberals will be 353 to 237 Conservatives—that is, the former will have a majority of 116, while this majority may be decreased or increased by the Irish vote. In 1868 Mr. GLADSTONE had a majority of 120, but this included all the Irish members who were in favour of the disestablishment of the Irish Church. Until the Irish Universities Bill divided the party, the non-Conservative Irish vote was always at the command of Mr. GLADSTONE. In the new Parliament the Liberal majority without the Irish vote will be almost exactly as strong as the Liberal majority was in 1868 with the Irish vote. It is obvious, therefore, that the Liberals are much stronger now than they were in 1868. How it happens that they are so strong now is being gradually cleared up as the history of different elections becomes known. The Conservatives have put forth their whole strength, but so have the Liberals, and the first cause of the Liberal victory is that the Liberals have worked with enthusiasm and with a much improved organization. But, although Mr. CHAMBERLAIN may be right in thinking that organization has done much for his party, enthusiasm has done more. Contest after contest has been won by obscure, unpaid, fervent canvassers. Crotchets have been thrown aside and the party has been thoroughly united. Moderate Liberals have not, as a rule, forsaken their party. There have been exceptions in London and in some portion of the educated classes. But they have been numerically few. Moderate Liberals have voted for Lord HARTINGTON, and advanced Liberals have voted for Mr. GLADSTONE. The Liberal party, moderate or advanced, meant to win, and if it really meant to win it was sure to win. No less than fifty-seven seats now gained by the Liberals were lost to them in 1874. They had so far only to reconquer their old ground. But, although the Liberal party was sure to win, in the sense that it would greatly reduce or annihilate the Conservative majority, it is impossible to say that it was likely to win to anything like the extent to which it has won. Mr. WILLIAM GLADSTONE, when returning to his friends at Hawarden after his triumph in East Worcestershire, told his hearers that long ago Mr. ADAM had informed him that the Liberals would in the next Parliament have a majority of forty, clear of the Home Rulers. This certainly was a remarkable prophecy; but it must be remembered that it is the business of a Whip to keep up the spirits of his party, and Mr. ADAM may have thought that a handsome round figure was the kind of thing to keep up Mr. WILLIAM GLADSTONE's spirits. It was impossible that even Mr. ADAM should really know all the causes that would be at work at the particular crisis of the dissolution in favour of the Liberals. To take only one instance—how could he have foreseen that Lord BEACONSFIELD would pen a manifesto that would damage and discredit his party, and would prompt numbers who were inclined to view without disapprobation the general conduct of the Cabinet to resolve that, so far as they could affect the decision, he should be displaced from the direction of public affairs?

The Liberal gains have been, speaking roughly, in four quarters—in the moderate-sized boroughs, which are now almost entirely represented by Liberals; in the counties, in Wales, and in Scotland. In all those quarters there were some common causes of Liberal success, of which the chief were a disposition to regard the contest as a personal one between Mr. GLADSTONE and Lord BEACONSFIELD, and a strong preference for the former, a growing confidence in and admiration for Lord HARTINGTON, a conviction that the last Parliament did not represent the real strength of the Liberal party, and a vague persuasion that a Liberal Ministry would reduce taxation. Perhaps beyond all is to be placed the success of success. Early Liberal triumphs propagated later ones, and it so happened that there was not a single day in which there was not a balance of Liberal gains to record. The zeal of the Nonconformists also made itself felt in every constituency where Liberals won the seat; and it was probably stimulated by the fact that on this occasion the English Roman Catholic vote was given to the Conservatives. But there were also special causes at work in each quarter. In the boroughs a chief—if not the chief—of those causes was indignation at the line taken by the publicans. It is difficult, except from actual observation, to picture the resentment aroused in the minds of small unpretending householders by the flaunting Conservatism of the beersellers, and by the difficulty which humble Liberals felt where to turn to get a glass of beer in peace. In the counties the Government suffered many reverses on account of their Agricultural Holdings Act. For electioneering purposes the Government would have done much better to have introduced no Act affecting agricultural holdings. The farmers considered that the Act had been brought in for their benefit, and then found the benefit illusory. A Liberal candidate had only to enumerate the landowners of the county who had contracted themselves out of the Act, and to ask what good the Act could possibly be supposed to have done to the farmers he addressed. They would not so much have minded their old Conservative friends having done nothing for them, but they were irritated by something having been done for them which turned out to be nothing. In Wales the Liberals had a godsend in the shape of Mr. MARTEN's Act. Here, again, if the Conservatives had done nothing, but merely resisted Mr. MORGAN's Burials Bill, they would at least have given no new handle of offence. But an Act which treated the burial of Dissenters as a merely sanitary measure, and proposed to put rural districts to expense in order to provide cemeteries, was easily represented as at once a personal insult to Dissenters and a wanton attack on their pockets. It is needless to say that Conservatives may reasonably insist that these interpretations of the Agricultural Holdings Act and of Mr. MARTEN's Act were unwarranted and unfair. But it is not necessary, in examining why electors voted as they did, to ask also whether they

were justified in so voting. The first thing after an election is to collect facts rather than to reason on them. In Scotland Mr. GLADSTONE did more perhaps than elsewhere to win elections. But long before Mr. GLADSTONE opened his Midlothian campaign, those who were acquainted with Scotch constituencies were sure that the Liberals would gain at the next election. Scotch electors busied themselves with the foreign policy of the Government much more than English electors did, and for some reason they disapproved of it from the first, and never wavered in their disapproval. There has, too, in recent years been growing in Scotland what may be termed a sense of equality rather than a passion for it. Humble Scotchmen not only say, but think, that one man is as good as his neighbour; and, although traditional feelings make them very glad to find one of their gentry on their own side, they regard the humiliation of a Conservative landlord as a proper tribute to their own importance.

It remains to say a few words on the Irish elections. There are 62 Home Rulers, 16 Liberals, and 25 Conservatives. The Liberals remain as they were. They have lost four seats to Conservatives and gained five from them. They have won two seats from Home Rulers and lost three to them. The Conservatives have lost five seats to Home Rulers and won none from them. The Home Rulers gain in the whole six seats, five from Conservatives and one from a Liberal. The gains of the Conservatives from Liberals were in the small constituencies of Carrickfergus, Coleraine, Enniskillen, and Newry. The gains of the Liberals from Conservatives were in the much more important constituencies of Donegal, Monaghan, Tyrone, and Dublin City. In the same way, the gains of Liberals from Home Rulers were in the small constituencies of Athlone and Dundalk, while their losses to Home Rulers were in Cork City, Kerry, and Kildare. The more important constituencies, therefore, so far prefer Liberals as against Conservatives, and Home Rulers as against Liberals. In Monaghan, Tyrone, and Donegal the influence of the priests or of the Presbyterian ministry was used in support of the Liberals, and in Dublin City the Roman Catholic ARCHBISHOP bestowed his blessing on the Home Ruler and the Liberal impartially. But the great interest of the Irish elections has centred in the attack of Mr. PARNELL on weak-kneed Home Rulers. He has arrived like a thunderbolt in constituency after constituency, and has imposed himself or a faithful follower on the electors. He has been returned for Cork City, Mayo, and Meath. He has turned out, as deficient in earnest devotion to the cause, Mr. O'CLERY in Wexford, Major O'GORMAN in Waterford, Mr. KING HARMAN in Sligo, The O'CONOR DON in Roscommon, Mr. MURPHY in Cork City, and he did his best to turn out Colonel COULTHURST in Cork County; and in Mayo he took the trouble personally to extinguish Mr. BROWN, for no other avowed fault except that the object of his displeasure had the audacity to own land. The priests have, almost without exception, strongly opposed him when they have thought him interfering in the business of other people; although in the county of Meath, which he represented in the last Parliament, they have ordered collections to be made at the doors of the churches to defray his election expenses. His most active lieutenant is Mr. FINIGAN, who has promised solemnly never to rest until he has persuaded a Saxon Parliament to pass a law enacting that an Irish farmer shall first live in complete personal comfort, then pay his general debts, and, lastly, give any balance there may be in his pocket to his landlord for rent. There is therefore every prospect of Mr. FINIGAN having a long and busy career. It is estimated that Mr. PARNELL's personal following will have risen from six in the last Parliament to 25 in the new Parliament. With this support he has pledged himself to quarrel with every English Government that can possibly be formed; and in a few weeks he will have the pleasure of beginning his campaign.

THE NEW PARLIAMENT.

ALTHOUGH the caprice of the constituencies and the triumph of numbers over intelligence cause just alarm, sanguine minds will find consolation in some of the circumstances of the election. Sir GEORGE BOWYER justly attributes the defeat of the Ministers in part to their unaccountable rashness in precipitating the dissolution. It is certain that large numbers of ignorant voters desired a change merely because industry had been depressed during three or [illegible] years. A revival of trade and a good harvest would have conciliated much unreasoning opposition, but the Conservative party would not in any case have obtained a majority. The lines of political division tend more and more to coincide with the social stratification; and, as Mr. GLADSTONE said at Hawarden, in slightly varied words, commercial wealth, diffused competence, and property are, in the eyes of the faction which he leads, disqualifications for the exercise of electoral power. Under the present Constitution, and still more when the proposed change in the suffrage shall have been accomplished, the advocates of innovation are likely to be almost always on the stronger side. Uniform household suffrage, attended by the establishment of approximately equal electoral districts, will deprive landowners of the remnant of influence which they still exercise in counties, and it will in a great measure disfranchise tenant farmers. The levity with which Lord HARTINGTON some years since pledged himself and his party to the change may probably be explained by the conscious security of position which is often found among social magnates. The probable abstinence of his Radical followers from any immediate display of mutinous independence will be explained by their knowledge that the approaching Reform Bill will bring them large reinforcements.

Optimists will place some reliance on the personal composition of the House of Commons. If Ireland is left out of consideration, there has, since the first Reform Bill, been no Parliament in which a larger proportion of members belonged to the wealthy and to the educated classes. The great majority hold the rank of gentlemen, as the term is conventionally understood; and many members, old and new, are above the average in ability and attainments. The factitious agitation for the direct representation of the working class has for the time almost wholly subsided. One of two artisan candidates who proposed themselves for election was rejected by a large majority of a popular constituency, and Mr. BROADHURST, who sits for Stoke, is at least preferable to his predecessor. One additional tenant-farmer has been elected; and one who was well known and highly respected has lost his seat by unlucky mismanagement of votes. If the House of Commons were unpledged, and if it were during its term independent of constituents, it might command as much confidence as it is possible to repose in any English Legislature. Two or three members of questionable character are always to be found in a numerous assembly, and there is no reason to suppose that they will have any weight among their colleagues. The Irish managers have not been well advised in selecting candidates without regard to social status, to local connexion, or to personal fitness. Some theorists approve the entrance into Parliament of even the lowest demagogues, on the ground that they will find themselves powerless; but it is not desirable to provide rewards for vulgar agitation. The majority of the Liberal party in the House of Commons strongly sympathizes with the less reactionary section of its defeated antagonists; but, without the faintest propensity to revolutionary policy, it will support all the measures which may be proposed by its leaders. In its first Session Parliament will probably occupy itself with legislation of secondary importance. Mr. LOWE's anxiety to strike while the iron is hot will scarcely be shared either by the Ministry or by the House of Commons. It will be impossible to deal with the complicated subject of land tenure during the approaching summer; and immediately after an election there can be no need for hurry in deteriorating the electoral system. The Burials Bill and the reduction of the borough franchise in Ireland will probably satisfy for the moment the popular appetite for change.

One of the most surprising peculiarities of the election was the tacit refusal of the constituencies to interest themselves in the questions which had been proposed to them by the leaders of both parties as main political issues. It is doubtful whether half a dozen seats have been won or lost through any predilection or prejudice of the electors with respect to Eastern or Indian policy. That no Conservatives have been converted by the violent and virulent declamations of Mr. GLADSTONE and his humbler imitators is proved by the large increase of the number of voters whom they polled. The much larger body by which they were defeated belonged, for the most part, to a class which knows and cares nothing about

foreign politics. Denunciations of the extravagance and turbulence of the worst and wickedest Government on record served, at most, to stimulate the democratic instinct which required no artificial pressure. With the doubtful exception of the member for Dundee, who had practically become a convert to Conservatism, none of the many Liberals who had supported the foreign policy of the Government suffered for their patriotic independence. Mr. WALTER, Mr. EUSTACE SMITH, Mr. BEAUMONT, and many other Liberal opponents of Mr. GLADSTONE's agitation have been re-elected; and Mr. GLADSTONE himself, though he must have deeply resented the conscientious defection of an advanced Liberal supporter, thought it prudent to commend the resolution of the electors of Newcastle to return Mr. COWEN. The exultation of the aggressive faction in Russia, and the uneasiness which prevails in other parts of the Continent, may perhaps be justified by the language formerly used by the Liberal leaders; but it is founded on a mistake, as far as it assumes a change in the opinions of the English people. Their verdict, as far as it has been in any sense taken, is neither for nor against Lord BEACONSFIELD's policy. It is only in times of unusual excitement that large bodies of men can persuade themselves to be enthusiastic on questions which they are incapable of understanding. In spite of the appeals of demagogues, the country habitually entrusts foreign policy to the conduct of the responsible Government. There can be little doubt that, if Lord GRANVILLE and Lord HARTINGTON control foreign affairs, they will, as far as possible, continue for the present the policy of their predecessors. No prudent calculator will undertake to trace beforehand the orbit which Mr. GLADSTONE may describe. It is only certain that his conduct would be regulated by sympathies and antipathies restrained as little as possible either by considerations of expediency or by diplomatic or historical knowledge. Six years ago Mr. GLADSTONE had taken as little interest in Turkish affairs as in other branches of foreign policy. His possible interference will not be rendered safer or easier through his wanton declarations of hostility to Austria. There is still reason to hope that the fortunes of the country may be placed in other hands.

Domestic legislation is likely in the present Parliament to be more important than foreign policy. Some of the largest measures on which the extreme Liberals are bent will not be brought forward for the moment. The Nonconformist ministers, who have been the most active election agents, scarcely hope to carry disestablishment until their strength is increased by the extension of the suffrage. It is doubtful whether any sweeping change in the laws relating to land will be soon effected. Lord SELBORNE expressed approval both of the Land Bills introduced by Lord CAIRNS and of his prudence in contenting himself with a moderate change. On this subject, as well as on the alteration of the franchise, Lord HARTINGTON has perhaps pledged himself prematurely. It is probable that in the course of two or three years new subjects may acquire a prominence which is not yet perceptible. Every movement will have a democratic origin and tendency, and its success will depend on preponderance of force rather than on the merits of special measures. The temper of the new House of Commons will not be revolutionary, except as far as it is affected by external pressure. The party of resistance will be in a minority both in the House and in the country, but the election shows that it will represent a large body of opinion. Notwithstanding Mr. GLADSTONE's sneers at station and property, it is not an insignificant circumstance that the present Government should have been supported by London, Westminster, Greenwich, and by a large party in the Tower Hamlets, and that it should have carried all the metropolitan counties. Middlesex, Kent, Surrey, Essex, Sussex, and Hampshire have not returned a single Liberal member. In Hertfordshire, Berkshire, and Buckinghamshire, the same preference was given to the Conservatives, though in either county the minority returned a third member. The Opposition have conquered the West Riding of Yorkshire; but Lancashire is still equally divided, and the great town of Liverpool is on the same side with the City of London. In all or nearly all the constituencies which have been enumerated the middle class is predominant. In South-West Lancashire the independent electors defeated the influence of Lord DERBY and Lord SEFTON. It may be roughly conjectured that the actual and retired tradesmen, the merchants and clerks, and the professional men, who thirty years ago were generally Liberal, have now joined the Conservative party. Although they are largely outnumbered, they cannot be left out of consideration in an estimate of political forces.

AFGHANISTAN.

A JOURNAL which is perhaps feeling its way to a change of party blames the Government for having, on the eve of its retirement from office, made a permanent and perhaps irrevocable arrangement of the affairs of an Afghan province. There might be some foundation for the censure if the new settlement of Candahar had been made after the English elections; but it is nearly certain that the appointment of SHERE ALI as chief, or Wali, had been completed before the reverse of the Ministerial fortunes. The Indian Government must have resolved on converting Candahar into a protected State when the railway was projected, for it is highly improbable that a work so important and so costly should have been undertaken, if the maintenance and use of the line was to be contingent on the policy of an independent Afghan Government. Lord LYTTON's responsibility in the matter is undoubtedly covered by the authority of the English Cabinet. It would be premature to form a positive opinion on the policy of the measure, until the reasons and circumstances are officially explained. It has long been known that Indian politicians of one school have thought it expedient either to occupy Candahar, or to secure a paramount control over its native Government. Other writers of authority contend that Khelat should form the limit or terminus of English enterprise in that direction. General KAYE has lately argued in a published letter that it is useless to incur the expense and risk of holding an advanced frontier, when the possession of the passes enables an English force at any time to occupy Candahar and, if necessary, to advance on Cabul. The Government has preferred the bolder policy, and it ought not to be supposed that those who had the amplest means of knowledge were necessarily in the wrong. It would be rash to place implicit trust in the loyalty of any Afghan chief; but thus far SHERE ALI has justified a confidence which is not inconsistent with judicious precautions. The most obvious objection to the plan is that it burdens the Indian Treasury and War Office with the maintenance of the troops at the disposal of the Residence, far in advance of the old frontier of the Empire. On the other hand, a friendly Government at Candahar will serve to counteract the turbulence of the remoter provinces of Afghanistan.

It is difficult to ascertain by a comparison of conflicting statements how far the Afghan tribes are connected with one another by a sentiment of national unity. It is easy to understand that a ruler of Cabul would consider himself entitled to reign over all the dominions which had at any time been united under his most powerful predecessor. It is not equally certain that Candahar would prefer the supremacy of Cabul to qualified independence under an English protectorate. It is possible to lay too much stress on the phrases which have been used by English politicians of both parties. An independent and friendly Afghan kingdom practically means a trustworthy subordinate ally. The Treaty of Gundamuk renewed the obligation more or less voluntarily incurred by DOST MAHOMMED, that he should allow to the Indian Government the direction of his foreign policy. In his time the covenant took the form of a promise to consider the friends and enemies respectively of the Imperial Power as also his own. To the same effect YAKOOB KHAN undertook to submit the regulation of his foreign policy to the Viceroy or his Resident at Cabul. The essential condition of the policy which has been pursued from time to time by different methods was not that Afghanistan should be independent, but that it should be friendly. The Candahar settlement is a bold experiment tried in the hope of securing the friendship of one part of Afghanistan which is important by its position. One of the considerations which moved the English and Indian Governments was probably a desire to open a new commercial route and market. SHERE ALI, in his independence and during the professed continuance of friendly relations, obstinately refused to admit English travellers and traders into his dominions. They will now be able to proceed at least as far as Candahar; and, if the protectorate continues and the railway is kept open, the city and province will pro-

bably enter on a course of unprecedented prosperity. The Indian Treasury may perhaps not profit immediately by the encouragement of trade, but it is part of the duty of the Government to encourage by legitimate business the enterprise of English and native traders. An arbitrary reversal by the future Ministry of the decisive measure which has been adopted would be unjustifiable unless it were founded on reasons which are not at present known.

It will fortunately not be possible, even if it were thought desirable, to interrupt the movement on Ghuznee which is now in progress. It is confidently asserted that the fortress is incapable of resisting modern artillery, and no doubt seems to be entertained of Sir DONALD STEWART'S early success. The chiefs who have visited Cabul for the purpose of negotiation appear to be of secondary rank, but it is supposed that their presence indicates doubt and division among the insurgents. It was a matter of course that their request for a suspension of operations against Ghuznee should be summarily disregarded. Whatever cost or exertion may be required would be preferable to the possession by a hostile or doubtful force of a stronghold commanding more than one of the roads from the Indian frontier to Cabul. Some of the neighbouring tribes which have lately been engaged in petty hostilities against the garrison of Ghuznee may perhaps be inclined to co-operate with the English troops. It may be hoped that resistance in the southern and eastern provinces will be suppressed before it becomes necessary to deal with the most formidable claimant of the Afghan throne. If current reports can be trusted, ABDURRAHMAN is consolidating his power in Afghan-Turkestan, and probably some of the unemployed soldiery from other provinces may have taken service under him. According to a recent telegram from Cabul, he announces that he will shortly arrive in Kohistan, where all the chiefs have promised to welcome him. If European notions of succession prevailed in Afghanistan, ABDURRAHMAN, as the eldest son of the eldest son, would be the legitimate heir of DOST MAHOMMED. His title derives some valid support from the military and political ability which he is said to have displayed during the long dynastic struggle which followed the death of DOST MAHOMMED. If the Indian Government has engaged in any negotiation with the pretender, its secret has thus far been kept. It is not a conclusive objection to the recognition of ABDURRAHMAN that he was for many years a Russian prisoner, and that he has been lately released for the apparent purpose of causing embarrassment to the Indian Government. It is not probable that gratitude would interfere with his regard for his own interests, if he were fully satisfied that his establishment at Herat depends on the favour of the Viceroy. It would be inconvenient that he should attribute any overtures which he may receive to fear of his success in an independent enterprise.

Notwithstanding the recent violence of clamour and invective, there is reason to hope that the new Government and Parliament will not allow the domestic and foreign policy of India to become a subject of party recrimination or conflict. The Duke of ARGYLL has disqualified himself by his writings and his speeches from any official connexion with Indian affairs. Lord HARTINGTON afterwards retracted or explained away a hasty declaration that it would be desirable to evacuate Afghanistan as soon as possible. The House of Commons, though it contains an overwhelming number of opponents of the present Government, will be less unequally divided on questions of foreign and of Indian policy. The minority of the Opposition which gave a patriotic support to Lord BEACONSFIELD still forms a portion of the Liberal party; and a hasty determination to renounce the advantages derived from great and costly efforts would be highly unpopular in the country. It is much to be regretted that several members and candidates of Indian experience have been defeated at the election because they were political supporters of the Government. Mr. SETON-KARR, Mr. C. DENNISON, and Mr. SMOLLETT possess a special knowledge in which the House of Commons is generally deficient. It is extremely unfortunate that Sir RICHARD TEMPLE should have failed to obtain the seat for Worcestershire for which he was willing to exchange one of the highest posts in India. The railway to Candahar, which is intimately connected with the policy of the Indian Government, will have been in a great measure the result of Sir R. TEMPLE'S energy. It is a bad consequence of the recent encroachments of faction on public spirit that nearly all the leaders of the Liberal party have pledged themselves to positive opinions on Indian policy, instead of reserving their freedom of judgment. They are welcome to throw all responsibility on their predecessors, if only they carry measures already commenced to their legitimate conclusion.

PRINCE BISMARCK'S WAYS.

PRINCE BISMARCK has been going through another of his resignations. Germany and Europe are so thoroughly accustomed to these resignations, and know so exactly what they mean, that no one on this occasion misinterpreted what Prince BISMARCK was doing. When Prince BISMARCK resigns the process is totally unconnected with his tenure of office. He is merely using a form of advertisement. Something has happened which he does not like, or something which he wishes to see done is left undone. In order to have his way he has only to let the world know that he wishes to have it. He must help the public to understand that he really attaches importance to the matter he has in hand. The method he adopts is singular and original, but effectual. He writes a letter to the EMPEROR, saying that he really must resign; and, before the EMPEROR has had time to read the letter, he sends to the papers to let them know that the letter has been sent. With the shortest possible delay the EMPEROR replies that he would rather cut off his right hand than part with his beloved CHANCELLOR. This letter is in its turn sent to the newspapers, and then everything is complete. Prince BISMARCK has registered his decree, and all the world obeys it. On this occasion the decree he has chosen to register is that there shall be a penny stamp on post-office orders. This does not seem a very grand cause of so great a disturbance, but it meant much more than it seemed to mean. The Federal Council had ventured to resist the imposition of this trifling tax, although Prince BISMARCK had directed that it should be imposed. The voting power of Prussia in the Federal Council is by no means proportionate to her wealth, population, and authority, and while in the division on the stamp duty Prussia with her immediate allies could only muster twenty-eight votes, the minor States told thirty votes, and Prussia and the CHANCELLOR were beaten. Of course, when the powerful resignation machinery was brought into play, the Federal Council acted in a spirit of what has been aptly described as repentant cheerfulness, and was quite ready to put any stamp on anything. But this was not enough. Repentance was good, but security for proper conduct in the future was better. Nothing annoyed Prince BISMARCK so much as that almost all the votes of the recalcitrants had been given by proxy. One member who attended had no fewer than thirteen votes in his pocket. This seemed to Prince BISMARCK a most pernicious abuse, and he thought that he might get rid of the resistance of the Federal Council without altering its constitution if he only stopped voting by proxy. He has a legitimate confidence in himself, and he feels reasonably sure that the representatives of the small States, although they are bold enough behind his back, and send proxies that may be used against him, dare not look him in the face and vote the wrong way. He has therefore decreed that proxies shall be abolished; and, what with its repentant cheerfulness and its members being made to come to look at him, the Federal Council has no doubt been brought sufficiently to its senses, and is not likely to give him any more trouble. The only criticism his success provokes is that it is his success. Prince BISMARCK is the German Empire, and a German Empire without Prince BISMARCK will be altogether a new creation.

In some directions Prince BISMARCK is carrying out his general policy with vigilance and success. He has invented another step for Germany to take in the direction of Protection. The German coasting trade is not quite so much in the hands of Germans as patriotic Germans could wish. Dutchmen and Danes manage to pick a meagre livelihood out of the unattractive process of creeping from one German port to another, and these interlopers are to be scared away. Justice, as it is put, is to be done to German shipowners, and upon Protectionist principles it is quite just that, as it is the business of the

community to enable German shipowners to live, everything should be done to enable them to live as comfortably as possible. Then Socialism is, it is said, growing discouraged under the influence of the wise system of repression which Prince BISMARCK has happily established. There has been an election in one of the districts of Berlin, and the Socialists have polled under three thousand votes now, while in 1878 they polled upwards of seven thousand. Professor VIRCHOW, the successful candidate, brings to the Chamber a European reputation, and he is a Progressist. This means that he is a Parliamentary enemy of Prince BISMARCK, and his return appears to have been greatly facilitated by the abstention of the Conservative voters. So far his success is not all that could be wished; but at any rate the Socialists appear to have been momentarily or permanently eclipsed, and so far repression has answered. Slowly, too—very slowly, but still perhaps surely—Prince BISMARCK is making way with his project for reconciliation with the Vatican. But he has faithfully redeemed his promise not to go to Canossa. Both sides are to give way if his scheme is realized, but his side is not to begin. The Vatican must start first on the road of peace. If the bishops and priests are ordered to behave pleasantly to the State, to forget all that has passed, and to work with the authorities in an affable and conciliatory manner, then Prince BISMARCK will do something for them. The existing laws shall be worked in a very indulgent spirit. Good turns shall be done all round, and possibly the happy day may arrive when some portion of the existing laws may be repealed. Signs are not wanting that Prince BISMARCK's offer, which does not err on the side of cowardice in concession, will before long be adopted.

Austria, on the other hand, does not appear to be going on quite as Prince BISMARCK would wish. The Austrian Ministry now occupies one of the most singular positions ever occupied by a Ministry. It has only got about twenty adherents in the Chamber, but neither the Constitutional nor the Autonomist party has a majority. The Ministry therefore trusts that by taking its twenty votes first to one side and then to the other it can command the Chamber. The Ministry is divided as nearly as may be between the contending parties; and in this respect, as in every other, Count TAAFFE spends his time in walking along a tight-rope and just keeping his balance. But a Minister cannot be always doing nothing. He must at least ask for the yearly supplies, if he does nothing else; and, whatever he does or asks for, there is always some one ready to quarrel with him. He had arrived so far in the Budget as to reach the estimate for secret-service money. The amount asked for was very small, but the Constitutional party declared that secret-service money could only be properly entrusted to a Minister in whom the Chamber had confidence. Count TAAFFE's twenty men and the Autonomists ought to have turned round and declared that the Chamber had confidence in the Minister; but enough members of the Autonomist party stayed away to let the Government be beaten. A motion of want of confidence was therefore carried against the Government, and theoretically the Ministry ought to have resigned. But Count TAAFFE cannot resign, as there is no one to replace him. The result is that Austria is reduced to as complete a state of inactivity as a great Power can fall into. And not only did the Right fail to support the Minister with sufficient determination, and allow itself as well as the Ministry to be beaten, but very free expression was given by some speakers among its ranks to the opinion that Austria should not be too cordial to Germany or too hostile to Russia. It is easy to exaggerate the importance of any section of Austrian politicians. The weight of the Court and the national feelings of Germans and Hungarians might in a critical moment break down all opposition. But at the same time it is evident that the policy which Prince BISMARCK might like to force on Austria is not a policy which escapes serious opposition in the Austrian Chamber. As time runs on it becomes apparent that the union between Germany and Austria is not nearly so strong or so indissoluble as was at one time supposed.

THE BONAPARTISTS AND PRINCE NAPOLEON.

PRINCE NAPOLEON'S letter has greatly disturbed the Bonapartist journals. Many of them had insensibly come to be Conservative—in the sense in which that much abused word is for the moment understood in France—rather than Imperialist, and they naturally dislike this sudden call to declare under which flag they are fighting. All their recent associations are Conservative, and as of late Conservative and Clerical have been pretty nearly identical terms, Prince NAPOLEON's letter makes silence impossible. There are some things about which a party writer may be discreet, but he cannot be discreet about the decrees against the religious orders. The Government have taken so decided a line that the absence of resistance is tantamount to support. He that is not with the religious orders is against them. Nor is it possible for the Conservatives to overlook defection upon this point. They have never before had such good cards dealt to them since the Republic was set up, and on the skill and unanimity with which they play them their future in a great measure depends. If a newspaper which has hitherto acted with them opposes them now, it must not expect to be taken back into favour a little time hence. Its desertion will be remembered as long as the conflict between the Church and the Republic endures. The Bonapartist journals have for the most part recognized this necessity, and sorrowfully thrown over Prince NAPOLEON. It is awkward, no doubt, to be at issue with the chief of the BONAPARTES; but it would be more awkward to be at issue with their subscribers. Nor is it the journalists of the party alone that have been annoyed by the PRINCE's letter. Since the death of Prince LOUIS the specific characteristics of Bonapartism have been much less conspicuous than they used to be. Royalists and Imperialists had grown accustomed to acting together. Neither of them had any present hope of overthrowing the Republic, and consequently neither of them cared to define precisely what form of Government they proposed to put in its place. This pleasant agreement to go as far as they can together has been sadly interfered with by Prince NAPOLEON's letter. These peaceful Bonapartist sheep have been suddenly accused by their companions of being wolves in disguise, and the only means they have of disproving the charge is to make common cause with them against the real wolf. The Conservatives who have accepted the Bonapartist pretension to be reckoned among the friends of order and religion suddenly discover that the head of the Bonapartist party approves the decrees against the religious orders, and openly allies himself with the policy of the Government. More than this, he declares that this policy is really the policy of the Empire, that the Republic has only borrowed it, and that all true Imperialists will see in its adoption a tribute to the soundness and permanence of Napoleonic ideas. There can be no fellowship between a party which regards this man as its leader and honest Conservatives. A Bonapartist who wishes still to be regarded as a Conservative must disavow allegiance to Prince NAPOLEON by word as well as by deed. It is not enough that he shows by his conduct that he detests the principles of which the letter is the expression, he must openly say that he detests them. Under such pressure as this the majority of Bonapartists, with Cardinal BONAPARTE and two BONAPARTE princes at their head, have given way. After all, their alliance with the Conservatives is of more importance to them than the favour of a leader who may never have any rewards to bestow. Men soon take their colour from the society they keep, and for the last ten years Bonapartism pure and simple has been in little favour in France. The enterprises of the party have all been undertaken in combination with Monarchists of various shades, and little by little the opinions which the members of the coalition hold in common have to many Bonapartists become more important than those which they themselves are supposed to hold apart.

The motives which have decided the Bonapartists generally to disown Prince NAPOLEON's letter are sufficiently intelligible; but it may be thought that, in proportion as they are so, the PRINCE's motive in writing the letter becomes harder to interpret. Why should he desire thus to break up the Imperialist party? He was under no pressing necessity to avow his convictions about the religious orders. No one had asked him for his opinion for or against them. He is not himself intimate with the

Clerical party, and his tastes and antecedents seemed to make it most natural for him to maintain an attitude of impartial and amused criticism of the violent language resorted to by both combatants. Why has Prince NAPOLEON put all these considerations aside and descended into the battle, with, as it may seem, no other object than that of throwing his own special followers into confusion? More than one possible answer may be given to this question. One is, that the change which the party had lately undergone, though pleasant enough for the rank and file, was not equally pleasant to its chief. It really amounted to an absorption of the Bonapartists in the Conservatives; and, as the ultimate aims of the Conservatives are Royalist, there was real danger that the aims of the Bonapartists might insensibly come to be Royalist too. Had Prince NAPOLEON's position in the party been more established this danger might have been considerably less. With the Legitimist pretender impracticable, and the Orleanist pretender self-effaced, a strong Bonapartist pretender might have held a conspicuous position among the rival Conservative factions. But to do this Prince NAPOLEON must himself have been a Conservative; at all events, he must not have been hampered by a character and a history which are scarcely compatible with Conservatism of the Clerical and reactionary type which now prevails in France. When once the impossibility of his leading the Bonapartists as a Conservative is admitted, the necessity of his leading it in some other character becomes evident. Prince NAPOLEON is not a man to throw away his chances. Accident has made him the head of the house, but the dignity did not, we may be sure, find him unprepared. The combinations which might raise him to greatness had no doubt been weighed and calculated, and he had not still to decide upon a policy when the news from Zululand arrived. He may only have been waiting for an opportunity to mark his assumption of the leadership by some decided step, something which should force men to ask themselves whether they were still Bonapartists. From this point of view it does not really matter that the immediate result of this step has been to breed a quarrel between the PRINCE and his followers. It would have been of little use to retain their nominal allegiance if this had been done at the cost of foregoing all further demands on it.

Another answer is that Prince NAPOLEON possibly sees that the Bonapartists have very few chances if they are content to remain the mere detachment of the Conservatives which they have lately tended to become. After all, there is no real identity between them and their allies. The one looks forward to a restoration which shall reunite France to a past which begins in the tenth century; the other looks forward to a restoration which shall reunite France to a past which begins with the nineteenth. The attitude of the two parties towards the Revolution of 1789 is necessarily and radically different. From that Revolution the Empire and the Republic alike take their origin; and Imperialists, equally with Republicans, are bound to accept, not merely its accomplished results, but the ideas on which those results are founded. Consequently it is the business of the Imperialists to show a reason for their existence, not merely as against the Republic, but as against the Legitimate Monarchy. In their recent relations with the Conservatives this necessity has been allowed to drop out of sight, and Prince NAPOLEON is probably of opinion both that it is essential to recall it to view, and that the quarrel with the religious orders affords an excellent opportunity of doing this. The ecclesiastical controversy is one about which the majority of the Republican party is greatly excited, and in spite of the Republican journals a great number of Republicans will be disposed to regard Prince NAPOLEON with far more friendly eyes now than before the publication of his letter. In the reactionary party he could never have been of any importance. In the Republican party he may be a force which the politicians at present in power may hereafter have to reckon in a way they will not much like.

LORD HAMPTON.

LORD HAMPTON, better known as Sir JOHN PAKINGTON, furnished one of many instances of the practical and administrative capacity which may be found among members of Parliament who have not been regularly trained for office. Birth and early association connected him with the Conservative [illegible] which might almost be [illegible] Minister. Though he was [illegible] without intellectual or rhetorical [illegible] PAKINGTON held opinions of his own on [illegible] which might in different circumstances have [illegible] to rank as a Liberal. In the days of his political [illegible] official activity, as at present, there was no real difference of temperament or of principle between moderate and intelligent members of the two great parties; and twenty or thirty years ago the passion and bigotry of popular constituencies operated less directly and less constantly on the minds of their representatives. Sir JOHN PAKINGTON had the good fortune to represent throughout his career a small rural borough, which only transferred its allegiance to a newcomer when he was far advanced in years. He was consequently at liberty to serve his country to the best of his judgment; and, while many of his contemporaries were more showy and more versatile, he was excelled by none in conscientious devotion to the public good. If his speeches were long and tedious, they contained the result of serious thought and study; and they were never defaced by personal or factious invective. On some occasions Sir JOHN PAKINGTON acted independently of his party, though he was never suspected of intrigue or of disloyalty to his political associates. It cannot be said that even among the most intolerant of his opponents he provoked any special enmity; for the spiteful comments which have lately been made on his appointment to a modest post were but incidentally addressed to himself.

It was much to his credit that, at the disruption of the Conservative party in 1846, he adhered to Sir ROBERT PEEL, when Lord STANLEY seceded from the Government. On this, as on other points, he belonged to the more advanced or less narrow section of the party. He had consequently no share in the discredit of the scandalous coalition by which Lord JOHN RUSSELL and Lord GEORGE BENTINCK drove the best Minister of the time from office. One of Sir ROBERT PEEL's last official acts was to recognize Mr. PAKINGTON's services by his elevation to a baronetcy. When, on his resignation, Sir R. PEEL finally retired from his position as a leader of a party, his adherents were at liberty to choose between the separate organization which was formed by the outgoing Ministers and reunion with the mass of the party. With Sir F. THESIGER and other faithful followers of Sir ROBERT PEEL who had voted for the repeal of the Corn-laws, Sir J. PAKINGTON determined to remain a Conservative. The Peelites, as they were called, consisting of Sir JAMES GRAHAM, Mr. GLADSTONE, the Duke of NEWCASTLE, Mr. CARDWELL, Mr. SIDNEY HERBERT, and three or four others, had with few exceptions held office under Sir ROBERT PEEL. It was not to be expected that the independent members who had acted with them in the Corn-law struggle should to the same extent share their just resentment against the Protectionist leaders. Neither the Duke of WELLINGTON nor Sir R. PEEL himself assumed the character of Peelites. During the short remainder of his life, the great Conservative statesman occupied himself chiefly in protecting his wayward Whig successor from the consequences of his blunders. Sir JOHN PAKINGTON accepted Lord DERBY as his chief; and when Mr. DISRAELI, in spite of Lord DERBY's jealous reluctance, forced himself into the position of leader in the House of Commons, Sir JOHN PAKINGTON became one of his most useful supporters; yet some surprise was felt when, six years after the defeat of the Conservative Government, he was selected as a member of Lord DERBY's first Cabinet. Up to that time his highest official functions had been those of a Chairman of Quarter Sessions.

In December 1851 Lord JOHN RUSSELL dismissed Lord PALMERSTON from office; and in March 1852, with a humorous celerity of retaliation, Lord PALMERSTON forced Lord JOHN RUSSELL to resign. The Peelites could have furnished the materials of an excellent Cabinet, but they were for the moment unpopular in consequence of their resistance in the previous year to the foolish Ecclesiastical Titles Bill; and they had in any case no party to back them. Lord DERBY once said that the uncouth grammatical term *anacoluthon* should be translated by the word Peelite, or a leader without followers. The disruption had, in the American phrase, decapitated the Conservative party so completely that when Lord DERBY formed a

[illegible] to be raised for the [illegible] a Privy Councillor. There had [illegible] times of a similar promotion [illegible] of Parliament to high official posts; [illegible] of Mr. DISRAELI's accurate judgment of [illegible] Lord DERBY found it possible to select a Cabinet [illegible] inferior in the ability of its members to the [illegible] which it superseded. General PEEL, Mr. [illegible] and Mr. WALPOLE supplied by natural aptitude [illegible] Parliamentary experience their want of official knowledge. Lord DERBY and Mr. DISRAELI might be fairly pitted against Lord JOHN RUSSELL and Lord PALMERSTON; and Sir JOHN PAKINGTON's industry and good sense soon acquired for him the character of an efficient head of a department. Lord DERBY's Administration, though it lasted only for a few months, produced many advantages to the party. Mr. DISRAELI took the opportunity to relieve himself and his colleagues from the burden of Protectionist principles; and Lord PALMERSTON, for reasons of his own, facilitated the operation. If the Peelites had remained neutral, Mr. DISRAELI would probably have defeated Lord JOHN RUSSELL in the decisive contest on the Budget; but the surviving colleagues of Sir ROBERT PEEL took the opportunity of a just revenge, and Mr. GLADSTONE, in his speech on the Budget, delivered a fatal blow to the Government.

The Conservatives, on returning to the Opposition benches, found themselves in a better position than before their brief trial of office. Their leaders had now Cabinet rank and a certain official experience, and though they could make no immediate impression on the solid ranks of the coalesced Whigs and Peelites, they were from this time ready to profit by any favourable opportunity. When Lord DERBY in 1858 formed his second Ministry, it was a matter of course that Sir JOHN PAKINGTON should hold a Cabinet office. When he became First Lord of the Admiralty, he was as ignorant as most of his predecessors and successors of all matters relating to the navy; but his natural capacity for administration, cultivated by his short experience at the Colonial Office, enabled him to master the rudiments of his business, and his patriotic zeal was stimulated by the discovery that his predecessors had allowed rival Powers to attain maritime equality or superiority. He perhaps described his measures too ambitiously when he boasted of reconstructing the navy. The ships which he built have long since been superseded, but nearly all chiefs of the Admiralty during twenty years have thought it necessary to profess the same desire to create a navy more powerful than that of any rival. His tenure of office was again not destined to be long. Mr. GLADSTONE had indeed so far allied himself with Lord DERBY that he voted on the side of the Government in the division which followed the general election of 1859; but Lord PALMERSTON prudently complied with his terms on the formation of his Cabinet, and from that time he approached more and more rapidly to the democratic tendencies which have not yet reached their lowest point. From 1859 to 1866 the Opposition made no attempt to recover office; and Sir JOHN PAKINGTON, acting separately from his colleagues, employed himself mainly in promoting national education. One of his schemes included the formation of School Boards, which, in accordance with the doctrines then professed by Nonconformists as well as by Churchmen, were to provide religious education in accordance with the opinions of the local majority. Although he was from time to time sharply criticized by leading members of his own party, Sir JOHN PAKINGTON persisted in his efforts; but it was impossible to effect so great a change without official authority, and without the support of a Parliamentary majority. In 1866 Sir JOHN PAKINGTON returned to the Admiralty, and in the following year he succeeded General PEEL at the War Office. He had not lost his characteristic zeal and energy; but for the third time he was compelled with his colleagues to retire after a short term of office. He had probably concurred, less unwillingly than some of his colleagues, in Mr. DISRAELI's Reform Bill, though he may have been less confident than his leader of the supposed party advantage of sinking to a lower political stratum. When Mr. DISRAELI at last succeeded to office as leader of a majority, Sir JOHN PAKINGTON had arrived at the age of seventy-four. He was compensated with a well-earned peerage for the omission to find him a place in the new Cabinet; and he accepted the comparatively humble post of First Commissioner of the Civil Service. The reward of a long and useful career was not excessive, and there can be no doubt that he continued, as in former times, to perform his duties with conscientious assiduity. No politician or Minister has left a more blameless reputation.

A QUESTION OF AUTHORSHIP.

FOR the last week there has been going on in the columns of the *Times* an interesting discussion as to the invention of the Farmers' Alliance. With that body itself and its objects the discussion has also had a good deal to do, though we need not have very much to do with it here. It seems, on the authority of some journals and of the person who claims to be its father, that the Farmers' Alliance has "driven the wedge home between "the farmers and the landlords," and has thus contributed to the late Liberal victory. To have achieved a class division between two sets of persons whose interests, in the interest of the country, ought to be married indissolubly, would seem to be rather a dubious feat. The notion suggests itself, too, as a short hint to an impartial farmer, that the result of such a proceeding might be by no means beneficial to the farmers themselves. Even under present circumstances, compulsory expropriation or compulsory division of property is not very likely in England. The most that the Farmers' Alliance, if it had really assumed any attitude hostile to the landlords, could expect would be legislation crippling the owner in his contract with his tenant. In such a case it might probably occur to the owner whether it might not be possible to do without tenants altogether. In Hungary and in America it is said that farms of a size equal to the largest English estates are cultivated, often under paid management, with a profit. Agricultural colleges are not unknown, and there are plenty of capable young men quite willing to go to them if the subsequent difficulty of finding capital for tenant-farming were withdrawn. It might some day strike a landlord of ten or twenty thousand acres that a staff of educated bailiffs or agents and a regular commercial management of his property might be preferable to the present system of capricious returns of rent at the most inconvenient times, with a staff of grumbling and caballing tenants placed by the law in a position of "Heads we win; tails you lose," and not to be calculated upon even at the polling-booth. Such a change would be a grave one in the rural economy of England, but it seems a not impossible consequence of aggressive farmers' organizations. However, the present question is a less serious one than this. The problem is not so much what is the Farmers' Alliance going to do, as who formed this notable organization? While M. RENAN has been lecturing on the origin of Christianity, Mr. F. H. O'DONNELL, late member and member-elect for the borough of Dungarvan, has been lecturing on the origin of the Farmers' Alliance. The latter question may be of less general importance than the former, but it is unquestionably possessed of interest in its way.

Mr. O'DONNELL is rather an authority on the subject of origins, and it is but recently that he indulged in a controversy with Lord LIFFORD on the subject of his own. We do not propose to enter upon that delicate question further than to observe that internal evidence seems to justify Mr. O'DONNELL's claim that Ireland and not Scotland gave him birth. For, in the first place, he is a decidedly amusing person, and, as a rule, there is more of this quality in those descendants of the bare-armed Fenians who have remained in Erin than in those who migrated to Caledonia. In the second place, there is in Mr. O'DONNELL another quality for which we find it hard to select a name which shall be at once polite and appropriate. The brutal Saxon is wont to call it "Irish impudence," and with the due allowance for the said brutality it might perhaps be called "engaging self-assertion." A Scotchman is not usually behindhand in estimating himself highly, but his self-assertion is rarely of such a lively and vocal character as Mr. O'DONNELL's. On this particular occasion Mr. O'DONNELL surpassed himself. Writing to the *Times* about the general election, after an appropriate war-dance over the bodies of the prostrate Tories, Mr. O'DONNELL proceeded to point out his own part in procuring the victory. "When I founded and organized the "Farmers' Alliance during April and May of last year," said he with a fine cursoriness of statement, "what had I "in view but the crushing, the overwhelming overthrow

"of British landlordism?" In other words, the cause of the late Liberal victory is Mr. O'DONNELL, with only the intermediate step of causation supplied by the Farmers' Alliance. It is perhaps not surprising that the authorities of the Alliance demur to this sweeping assertion of parentage. They apparently belong to the unwise majority of children who don't know their own fathers. The Secretary of the Alliance, Mr. W. E. BEAR, wrote at once to disown his maker. He admits a certain suggestion on Mr. O'DONNELL's part, but denies everything else, and is especially indignant at the statement that "Irish agitation has been trans-"planted into the centres of English landlordism." The chosen of Dungarvan would have been false to the noblest traditions of his race if he had failed to accept the challenge. He replied in a letter of four paragraphs, in each of which a distinct flourish and "whack" of the shillelagh is visible and audible. In the first, scorn is loftily applied to the "Liberal Secretary" who "would gladly disavow "an obnoxious obligation." In the second, Mr. O'DONNELL asserts that he paid the expenses of the first meeting of the Alliance at the Westminster Palace Hotel, where (more by token) the inquirer can see the identical receipt. In the third, "the merit of others" is recognized, "but," the writer repeats sternly, "I "founded the Farmers' Alliance." Finally, Mr. BEAR is reminded that, "as he will remember, I have always "admitted that his ignorance of Irish agricultural condi-"tions was only equalled by his excellent sense in English "and Scotch affairs." It must be allowed that the blackthorn of Dungarvan is no mean weapon. The Secretary's retort that Mr. O'DONNELL promised five pounds and paid two guineas is worthy of a Saxon. In the first place, it reduces the question to peddling matters of arithmetic beneath the attention of a great soul which, in travelling about England on other business, founds casually, and as a *parergon*, a Farmers' Alliance. In the second place, it shows a lack of astuteness. It would have been wiser of Mr. BEAR to "repee the thrilling obligeotion," as Captain COSTIGAN has it, of the two guineas, and to claim the five pounds. A doughtier champion, however, now appears to teach the fainting battle how to rage. Mr. JAMES HOWARD, the Chairman of the Alliance, disposes of Mr. O'DONNELL very shortly. The founding of the Alliance was, he says, a question of time only, he himself and Mr. BEAR having designed it for years past. Mr. O'DONNELL's action happened to coincide with the actual establishment of it; but at the very first meeting he was found to be impracticable. The words United Kingdom shocked Mr. O'DONNELL's Irish soul, and Mr. HOWARD "cut the cable"—and Mr. O'DONNELL. Mr. HOWARD further denies that the Alliance is political or that its object is discord. These are points upon which there seem to be differences of opinion; but Mr. HOWARD, who has got into Parliament on the shoulders of the Alliance, ought to know. We have not yet seen the repartee which may be expected from the claimant to the authorship of that association, who is left so unpleasantly adrift by its chairman. Perhaps Mr. O'DONNELL, having asserted himself sufficiently, will disdain to retort upon his ungrateful children, and will be content to leave Mr. BEAR in the attitude of REGAN, and Mr. HOWARD in that of GONERIL, to the reprobation of the world. It is a pretty quarrel; but, like other things, it might get tedious if it went on too long.

There is, however, a certain tone of asperity in Mr. HOWARD's letter which is not altogether unworthy of notice. It may be that "a little grain of conscience made "him sour," and, if so, we do not greatly wonder at it. It is admitted that Mr. O'DONNELL had some connexion, if only an accidental and temporary one, with the formation of the Alliance. Mr. HOWARD found him impossible and cut him adrift. Now would it not have been a little wiser if Mr. HOWARD and Mr. BEAR had declined the connexion altogether instead of severing it after a time? Mr. O'DONNELL's opinions on land questions could hardly be unknown to them, unless they are persons of singular want of knowledge in their own special subjects. It is true that the anti-rent agitation had not in May flaunted itself so unblushingly as it did in the late summer and early autumn. But though this might be an excuse for outsiders, it certainly could not be one for experts. If opposition to landlordism was so abhorrent to the real founders of the Alliance as Mr. HOWARD wishes to make out, it was certainly odd that they should parley with a member of the extremest group of Irish intransigents. At any rate they can hardly complain if Mr. O'DONNELL, especially when he sees his own view of the matter enforced by authorities more or less independent, should attribute to the Alliance the principles which he had himself in view in helping to found it. Oddly enough too, Mr. HOWARD does not seem to have differed with Mr. O'DONNELL on any point affecting the land question, but on one of pure politics. We are glad that the newly elected member for Bedfordshire is staunch to the Union—that he did not, like some political friends of his, try to make terms with Home Rule at a time when it seemed that Home Rulers were necessary to the Liberal party. But the Union and the land laws are, after all, two separate questions, having no direct, though it may be much indirect, connexion. It would have been more satisfactory if moral as well as political difficulties had helped to develop the incompatibility between father and children. As it is, Mr. HOWARD's assurances of the objects of the Alliance are satisfactory, though a little vague, and not wholly consistent with the assertions of others. But for the future he will do well to remember certain ancient proverbs about evil communications, about the information supplied as to a man's character and objects by the character and objects of his companions, and so forth. On the face of the thing it looks very much as if Mr. O'DONNELL's claim to have thrown, in one way or in another, an apple of discord into English rural life were by no means unfounded. Whether Mr. HOWARD and Mr. BEAR were his accomplices or his dupes is an interesting but secondary question.

CHARITY ORGANIZATION.

LORD DERBY gave as one of his reasons for making a speech at the annual meeting of the Charity Organization Society on Tuesday, that it has been bitterly and continuously attacked. Lord DERBY accounts for this unpopularity by the fact that one of the main functions of the Society is the detection of imposture. Desirable as it is that the rogues who write begging letters should be exposed, they cannot be expected to enjoy the process, and even when exposed, they have occasional opportunities of throwing dirt on the Society which has interfered with their peculiar industry. It is strange if, among the many who have given them money, they do not find some who will continue to believe their story even after its falsehood has been proved; and occasionally they are able to persuade those to whom they apply that it would be useless and even cruel to make inquiries about them from a Society which will be sure to believe its own officials, no matter what they say. Occasionally, too, the most careful inquiry will lead to a wrong conclusion, and relief which is really needed may be refused in the honest conviction that the applicant is undeserving. The really poor are sometimes as perversely stupid as the sham poor are perversely ingenious; and, in their desire to put their case in the most favourable light, they conceal things which they had better have told. Some one who knows that they are really very proper objects of charity gets indignant when their application is rejected, and from that day forward the Charity Organization Society has another enemy.

There is another circumstance also which perhaps goes quite as far to account for the attacks made on the Society, and that is the misconception which often exists as to its true object. It is sometimes assumed that to organize charity is the same thing as to supersede it, and that the Society has not done its duty if it refuses relief to any one who is really in distress. In point of fact, the Society, as originally constituted, was not intended to relieve distress at all. It was supposed that this duty would be adequately discharged by existing charitable agencies, if they would only listen to the Society's exhortations and avail themselves of its apparatus for making inquiries. By degrees it was found that the Society's operations brought the members in contact with a good deal of distress which no existing agency seemed adequately to meet. Existing agencies had their lists full, or looked coldly on persons recommended by a Society with which they felt no sympathy; and in this way local Relief Committees grew up, and found more and more to do, with the result that relief now employs a larger share of the Society's resources than organization itself. Still the distribution of this relief is governed by

rules which are not, and are not meant to be, those which govern private charity. The reason for this distinction is obvious. The Relief Committees of the Charity Organization Society are not intended to take the place of other charitable agencies. On the contrary, they are specially designed to fill any gaps which may be left in the network of these agencies. Considerable care, therefore, is necessary to prevent mutual overlapping, and one of the results of this care is the frequent rejection of cases, not as undeserving, but as "ineligible." It often happens that people who have recommended cases to the notice of the Society take this rejection as a personal affront. They forget that the Society was founded, not to spend money on cases sought out by private charity, but to seek out cases for private charity to spend money on, and they take every occasion that offers itself of proclaiming their disappointment and disgust that the Society is not something else. There is a rule, for example, which forbids relief to be given except in cases in which there is reason to suppose that permanent good will be done. This is not a rule for the exercise of individual liberality. It was never intended to lay down as a general principle that a man may not be saved from starvation to-day because he is very likely to be starving again to-morrow. The rule is simply framed for the guidance of the Society's own operations, and the meaning of it is, that as there are abundance of agencies, charitable and legal, which relieve cases of ordinary destitution, the Society's money shall be kept for cases in which a little judicious outlay may place the applicant beyond the reach of destitution. If a case rejected as ineligible on the ground that no permanent good could be done by relieving it happens to have been recommended by some one who has no real knowledge of the Society's operations, it is as likely as not that he will be excessively indignant at the refusal of relief, and will very possibly talk about drying up the generous flow of charity, and, in fact, write much such a letter as that quoted by the Duke of Northumberland on Tuesday. It is fair, however, to say that certain members of the Society are not always careful enough to distinguish between distress which may be properly relieved by private charity and distress which may be properly relieved by the Society's Committees. Nothing is more calculated to do the Society harm than an attempt to treat these two spheres as necessarily identical.

It must be admitted, as regards the organizing function of the Society, that a good deal of time is sometimes wasted and a good deal of nonsense sometimes talked. If it were desired to give practical people a distaste for charity organization, the best possible way would be to show them the notices of motions to be discussed at the weekly meetings of the Central Council, and to withhold from them the fact that there are a large number of District Committees doing actual work among the London poor. Men who in their own estimation are excellently qualified for seats in the House of Commons are occasionally compelled to content themselves with seats in the Council of the Charity Organization Society; and, under these circumstances, it is useless to hope that a great deal of eloquence will not be spent on abstract resolutions. But even the Central Council does more useful service than might be expected from the reports of its debates. It works out schemes which, if they were not taken up by somebody with energy and leisure, would never be worked out at all. It has lately, for example, been giving careful attention to the project of superseding charitable by provident dispensaries; and Mr. Stansfeld stated on Tuesday that he hoped in a few days to lay before a large representative meeting a plan, in the first place, for covering the whole metropolis with a self-supporting system of provident dispensaries, and, secondly, for so associating the dispensaries with the hospitals that both hospitals and dispensaries might each carry on the work they were specially fitted to deal with. At present the whole system of medical charity is in the most unsatisfactory state possible. There is no more reason for presenting people with advice and medicine when they can afford to obtain them for themselves than there is for presenting them with food or clothing when they are in a position to buy both. Yet hospitals and dispensaries, for the most part, pay no attention to the poverty of the applicant. Either they dispense advice and medicines to all comers, or they regulate their benevolence, not by the inability of the applicant to get relief in other ways, but by his success in getting an order from a subscriber. Upon the provident plan, every one who is not absolutely destitute would pay a small weekly sum to a district dispensary, in return for which he would get medical advice and medicines. The class of cases which are now dealt with in the out-patient department of hospitals would thus be provided for; the hospitals would be enabled to devote themselves in a great degree to the care of in-patients; and those who now throng the out-patients' room, without any adequate cause beyond their own desire to save expense, would be forced either to pay at least a subscription to a dispensary or to run the risk of having their circumstances inquired into and their application rejected by the hospital officials. Probably a very small weekly payment, if the subscribers were numerous, would cover the expenses of a provident dispensary, and cases in which this weekly payment had not been made would properly be left to the Poor-law authorities. The increasing connexion between the Charity Organization Society and the Guardians of the Poor is one of the most encouraging features of the movement. The right enjoyed by the English pauper to maintenance at the cost of the community is so absolute that the greatest possible care is needed in its administration. Genuine destitution is the only title to this relief that can be safely recognized, and the existence of such machinery as that provided by the Charity Organization Society enables the Guardians to pass over many cases which without such machinery they would probably feel compelled to relieve. Altogether, though the Society is not perfect, its merits very much exceed its faults, and its disappearance would leave a very serious gulf in the existing arrangements for dealing with poverty.

THE NEW PROVINCIALISM.

It has long been held that among the special blessings enjoyed by England was the absence of anything like a true provincialism, or feeling of estrangement between the capital and the country. The very use of the term "provinces" has been condemned as a late and unintelligent vulgarism expressing a difference which does not exist. It is quite true that until very recently those who held this view occupied an exceedingly strong position. Even in old days, when "Lunnon" was the object of something short of affection on the part of countrymen, it was regarded rather with awe than with dislike. The Londoner was an eccentric, uncouth, and rather immoral being, but he was wise and knowing, especially as regarded political matters. The influence of landlordism, too, formed a link between town and country which was hardly known anywhere else in Europe. The greater, if not the smaller, landlords were in more or less sympathy with the metropolis, and the country with the landlords. As coaches, and in the beginning railroads, increased, the bonds of union were drawn tighter, and a good many misunderstandings were removed. The elections for London, Westminster, and Middlesex still had a kind of prerogative force in the kingdom, and though counties and small boroughs by no means followed like sheep, the importance of metropolitan opinion in political matters was never for a moment contested. Of late years, however, we have seen a good deal of this changed, and the most singular feature of the late—in compliment to Orkney and Shetland we should perhaps say the present—general election has been the split between the capital and the country. The so-called metropolitan boroughs have indeed returned a majority of Liberals; which, however, those who have profited by it cannot pretend to construe as a majority of wealth, knowledge, or intelligence. The cities of London and Westminster have given the Conservatives an enormous majority, and the Home counties, which, owing to the centrifugal system of modern London living, represent the capital more than even the cities of London and Westminster, and far more than the satellite boroughs, have returned in the face of one of the strongest political reactions ever known a solid phalanx of twenty Tory members. A singular letter which appeared in the *Times* of Wednesday from Mr. George Melly, a well-known Liverpool Liberal and an ex-member of Parliament, asserts, after Sir W. Harcourt, that London has been completely ignorant of the political opinion of the country; or, as we should prefer to put the thing, that the country has chosen to ignore or contradict the political feeling of London. Mr. Melly's letter is not directed avowedly to this point, but to a previous letter of Sir George Bowyer's, with which we need not trouble ourselves. It is sufficient that the reply contains a distinct expression of the existence of a political feeling in the country hostile to that of London, which is one of the most flagrant notes of provincialism. Nor is it superfluous to add that the persistent adulation which Mr. Gladstone has for years paid to provincial opinion as contrasted with metropolitan confirms this theory. That adulation indeed has been no doubt to a great extent a cause as well as a consequence of the phenomenon. But all careful students of Mr. Gladstone must have noticed that he often has a singular *flair* of popular feeling, a quality which has stood him in good stead, and which enables him to lead by dint of following, in a way

to which historians, in the case of statesmen of less severe and lofty morality, have sometimes applied hard names.

It seems at first sight incredible that such a feeling, which is contrary to all notions of progress, civilization, and so forth, should have grown up in these latter days. But, if the conditions are inspected more narrowly, the strangeness wears off. In the first place, paradoxical as it may seem, the very perfection of means of communication has loosened instead of tightening the hold of London on the country. In old days, and even within the last twenty or thirty years, a man who had occasion to come to London on business was forced to stay there perhaps for weeks, certainly for days. In the last few years this has been changed. A man eats his breakfast in a great town of Lancashire or Yorkshire, travels up to London, does a couple of hours' business, and is back and in bed before midnight. If his business is not capable of being despatched quite so rapidly, he puts himself into the sleeping-car of the mail, is shunted into a siding at St. Pancras or Euston till it is time to get up, breakfasts in the refreshment-room, does his day's business, and returns in the same way to breakfast at home thirty-six hours after he left it. In neither case has he time to shake down into town life, to rub opinions with his fellows of the capital, to cease, in a word, to be provincial. So with holidays. Where once he took his wife and daughters to London, he now takes them to Paris or to Rome. There are day schools or grammar schools in his own town, whether it be large or small, which enable his children to pass their youth as well as their manhood in it. In some cases regular law courts attend to local business. The very amusements which quite recently were only attainable in London come to the great and even the small provincial towns to seek spectators. Nor is it to be forgotten that the provincial press has immensely increased of late. Not so very long ago a daily newspaper was unheard of in any but the very largest country towns; now such papers are as common as blackberries, while all the larger towns have their halfpenny evening papers as well, which make the London press almost superfluous. In this provincial press, too, there is an element which works positively in the same direction in which the influences just mentioned work negatively. The first-hand knowledge of London life, as distinguished from mere office business, is relatively diminishing. But a marvellous second-hand knowledge is supplied by the great creature known as the London Correspondent. This wonderful man belongs to the Reform and the Carlton at the same time, takes friends to dine—apparently by special permission of the Committee—at the Athenæum, is hand and glove with every Cabinet Minister, every foreign Ambassador, every famous artist and man of letters. Mr. Melly unconsciously supplies a delightful instance of the powers of the London Correspondent. "It was believed in the provinces," he says, "rightly or wrongly, that the ovation [to Lord Beaconsfield in the summer of 1878] was arranged and paid for; that Woolwich artisans were brought in special trains to swell the triumph; that hired mobs were incited to disturb public meetings." This is the sort of thing, as every one who has occasion to read country papers knows, with which their correspondence columns teem, and Mr. Melly, with some ingenuousness, points to the results of the election as a consequence of it. To these important influences—ignorance of and exclusion from the actual intellectual life of London, and fantastic, not to say false, representations of that life—there are others to add. The Ballot has weakened, if it has not destroyed, the influence of large proprietors, great merchants, and the like, who actually live in London, and are partakers in the movement of the place. No greater proof of this could be had than the large number of "carpet-baggers" who have ousted local magnates in the recent contest. Last of all, in large sections of the country like Scotland and Wales there has been no hesitation in appealing to a kind of pseudo-national sentiment, which is in itself declared provincialism pure and simple. From all which considerations we are inclined to think that Mr. Gladstone and Mr. Melly are perfectly right, though doubtless they will not thank us for the form which our approval takes. It does actually seem that a recrudescence of provincialism has taken place, that it has played an important part in the late contest, and that it will have to be reckoned with in political calculations henceforward.

If this is the case, it appears to us to be beyond all doubt a grave misfortune. It is not only that any such feeling must interpose a serious difficulty in the way of consistent and sober statesmanship, which is hampered enough already, in all conscience. It is not merely that the loss of national unity of feeling is a very considerable loss; the worst of it is that, if the provinces are going in this way to assume a kind of *frondeur* attitude towards the educated inhabitants of the capital, it is pretty certain that they will be habitually in the wrong. For it must be remembered that the capital of England at present, and the cultivation and society which represent it, by no means deserve the uncomplimentary descriptions which have in times past been applied to capitals such as Rome or Paris, and which at some times of its history might have even been applied to London itself. The London Correspondent before mentioned (and Mr. Gladstone and some other persons of distinction have not been ashamed to follow him) is wont to represent the Clubs, notwithstanding his own multifold membership thereof, as bodies consisting of luxurious idlers, dividing their time between wicked cabals against pure-minded statesmen and indulgence in the grossest luxuries. It need hardly be said that, if the provinces (the phrase is rather Mr. Melly's than ours) believe this, they make a very absurd mistake. In the first place, since the multiplication of Clubs, good, bad, and indifferent, the term has lost any specific meaning; and, in the second place, London society, in the large sense in which it has just declared its faith in the present Government, or rather its disbelief in that which is to come, cannot be described by any such term at all. It does not consist of the luxurious idlers of democratic imagination in any but an infinitesimal proportion. It consists of men of all degrees of wealth, intelligence, and knowledge, most of whom work more or less hard in their way, who, almost whether they will or not, have the movement of affairs at home and abroad constantly before their eyes, who are singularly free from respect of persons, and who have none of the local jealousies, prejudices, and limitations which are so noticeable to a Londoner in the inhabitants even of the largest provincial towns. Mr. Melly, who is full of matter for comment, tells us that in Leicestershire the Liberals hung portraits of Mr. Gladstone across the lanes for the rustics to worship, and that "the seed of the Bulgarian agitation has never ceased to grow." These are two admirable illustrations of the sort of fetish worship which forms part of all provincialism. The average metropolitan elector who gave his vote last week for the Conservatives would certainly not have been induced to do so by a portrait of Lord Beaconsfield being hung across Chancery Lane. As to the Bulgarian affair, he probably reflected that a good many things had happened since that, and gave his vote according to actual circumstances, and not according to his views four years ago. Indeed Mr. Melly's reference reminds one strikingly of some remarks of Frederick the Great about the Trojan war. This attention to actuality is what may, as a rule, be expected from a metropolitan population which is not frivolous or uninstructed; and it is a want of this attention to actuality and a concentration upon all sorts of bygone questions, personal likings and antipathies, vague accusations of immorality, and so forth, which is eminently characteristic of provincialism. The provincial—we are not now speaking injuriously, but defining him as a general idea—is always behind the times, can always be led away by red herrings of sufficient potency, is always ready to let his jealousy of the capital vent itself. We should have said not very long ago that this unpleasant species was unknown in England. But Mr. Gladstone, it would appear, has discovered the cockatrice's egg, and has succeeded in hatching it with the warmth of his flattery. The election hints the fact, Mr. Melly states it more or less openly, and we, albeit unwilling, must, we suppose, admit it.

MISS COBBE'S RECOLLECTIONS OF MARY CARPENTER.

MR. LECKY has pointed out with no less force than eloquence the profound influence exercised by "the mediæval conception of the Virgin Mother" in elevating woman to her rightful position in society. And he rightly considers it a striking illustration of the qualities which prove most attractive in women that one "of whom we know nothing except her gentleness and her sorrow" should have exerted a magnetic power upon the world incomparably greater than that of the most majestic female patriots of Paganism. And this influence was materially aided by the noble example of the virgin martyrs of the early Church, like St. Perpetua and the Lyonese slave girl Blandina. It introduced and consecrated a new ideal of excellence in which women may naturally claim pre-eminence. For the change from the heroic to the saintly, or from the Pagan to the Christian ideal, was a change from an essentially masculine to an essentially feminine type of goodness. In the classical ages it was rather by overcoming than by ennobling the characteristic peculiarities of their sex that women became illustrious. But we admire St. Elizabeth of Hungary, or Mrs. Fry, or Sister Dora, for the lofty qualities they exhibited, not in spite of their sex but in consequence of it. It is not indeed too much to say that no earlier religion, not excepting the Jewish, had given adequate scope to that gracious instinct and genius of charity which may be termed the crowning glory of womanhood. In the Christian Church it seemed at once to spring up by a spontaneous growth, and we find it already conspicuous in the New Testament. Coming down a little later, the mothers of St. Augustine, St. Chrysostom, St. Basil, and others eminent among the Fathers of the Church were mainly instrumental in the conversion of their sons, while in the organization of charitable works women took a leading part from the first. Fabiola, Paula, Melania, and other noble Roman ladies devoted their time and their means to the founding and propagation of vast charitable institutions; the Empress Flaccilla used herself to nurse the sick in the hospitals, and Tertullian tells us, in the second century, that the discharge of such duties was held incumbent on Christian wives. At a very early period this new development of woman's mission received a direct ecclesiastical sanction in the institution of "widows," "deaconesses" and consecrated "virgins"—we need not enter here on the various controversies raised as to the precise form of these different offices or societies, which eventually merged in the conventual system of mediæval Catholicism. The total suppression of that system at the Reformation is regarded by Mr. Lecky, not without reason, as a misfortune to women and to the world in general. He even goes so far as to say that there is nothing so much to be deplored in modern history as the mistake made by the Reformers, who were often so timid in doctrinal innovation, when they levelled to the ground, instead of seeking to regenerate it, the whole conventual institution of the Church." It is obvious to remark that their mistake has been more or less

exemplified in our own day, both in the English Church and among foreign Protestants, by the revival of sisterhoods, deaconess institutions, and the like. But it is also true, and is more to our immediate purpose, that under no phase of Christian belief which retained anything of the spirit of the Gospel, Catholic or Protestant, have there ever been wanting splendid individual examples of that charitable self-devotion which finds its corporate expression in the life of religious orders of women. Macaulay observed long ago that Mrs. Fry the Quakeress would certainly have been canonized by the Church of Rome, and the same may be said of the Unitarian Mary Carpenter and the Anglican Sister Dora, to take illustrations only of recent date. As regards the former indeed, Miss Cobbe tells us that she has "heard pious Catholics, while she lived, speak of her as 'that other Mary—Mary Carpenter.'"

We have so lately reviewed Mary Carpenter's *Life and Work* that there is no occasion here for attempting any sketch or criticism of her career as a whole. It is Miss Cobbe's avowed object in the suggestive and very readable paper she has contributed to the second number of the *Modern Review* to supplement the published Life by some personal recollections of her own, and these offer several points of interest. In her religious convictions Mary Carpenter belonged to the extreme right, or, as it is sometimes called, orthodox section of the Unitarian body, which is now, we believe, a rapidly diminishing one. Miss Cobbe quotes the language of prayers that she was in the habit of reading, which appeared to her—as it certainly does to us—more "Trinitarian" than Unitarian, and which was therefore to herself, as an avowed theist, not only unreal but "unspeakably painful." And it is curious to learn how Mary Carpenter, who rejected the doctrines of the Church of England not only with aversion but with something like contempt, thought it a sufficient and conclusive answer to any sceptical difficulties based on modern Biblical criticism to say, "Oh, but my father [Dr. Lant Carpenter] *settled all that! He harmonized the Gospels.*" It may be, as Miss Cobbe suggests, that in her later years her views on such matters became broader; but at all events we have here an instructive illustration of a fact sometimes apt to be forgotten or ignored, that rigid dogmatism is confined to no one single school of Christian, or indeed of non-Christian, belief. Puritans, Baptists, Quakers, and even atheists—who would have scorned the modern sobriquet of Agnostics—have shown themselves every whit as dogmatic, and moreover quite as ready to persecute for their own cherished beliefs or unbeliefs, as the sternest of Roman Catholic inquisitors. But the special charm and nobility of Mary Carpenter's character and work, and it may fairly be added of her religion, was independent of the particular form of theology she had inherited from her father, and we can readily accept Miss Cobbe's assurance that no words can exaggerate the depth and sincerity of her devotion and saintliness of life. Few lives could better endure the Scriptural test of being judged by their fruits. Ascetic, or rather Stoical, as she was in her own temper and habits, she could be generous and indulgent to the weaknesses of others, and her cheerful and kindly forbearance in dealing with her ragged scholars is no less admirable than her courage, energy, and self-devotion. All these qualities were called into play in the "Ragged School of St James' Back," situated in a filthy and disreputable lane at Bristol—now happily swept away—into which no policeman would ordinarily venture to penetrate:—

It was a wonderful spectacle to see Mary Carpenter sitting patiently before the large school gallery in this place, teaching, singing, and praying with the wild street-boys, in spite of endless interruptions caused by such proceedings as shooting marbles at any object behind her, whistling, stamping, fighting, shrieking out "Amen" in the middle of the prayer, and sometimes rising *en masse* and tearing, like a troupe of bisons in hob-nailed shoes, down from the gallery, round the great schoolroom and down the stairs, out into the street. These irrepressible outbreaks she bore with infinite good humour, and, what seemed to me more marvellous still, she heeded, apparently, not at all the indescribable abomination of the odours of a tripe and trotter shop next door, wherein operations were frequently carried on which, together with the *bouquet de peuple* of the poor little unkempt scholars, rendered the school, of a hot summer's evening, little better than the ill-smelling *giro* of Dante's "Inferno." These trifles, however, scarcely even attracted Mary Carpenter's attention, fixed as it was on the possibility of "taking hold," (as she used to say) of one little urchin or another, on whom, for the moment, her hopes were fixed.

Nor was the humorous element by any means absent from her own mind or from the circumstances of her self-chosen calling. The droll things which occurred daily in this school, and the wonderful replies of the untrained and unruly urchins whom she was labouring so hard to civilize, amused her immensely. She would say herself, "Only to get them to use the *school comb* is something!" One day she complained to Miss Cobbe that she had been heaping coals of fire on the head of an ungrateful teacher without producing the desired effect. "It will take *another scuttle*, my dear friend, was the reply." At this she laughed heartily. But the next evening she had to make the sorrowful confession, "I tried that *other scuttle*, but it was no go!" Some of the boys' answers are very happy in their way. Thus one young ragamuffin, being asked what was meant by conscience, replied, "A thing a gen'elman hasn't got, who, when a boy finds his purse and gives it back to him, doesn't give the boy sixpence." Another, who was questioned as to what pleasures he enjoyed most in the year, was candid enough to confess, "Cockfightin', ma'am; there's a pit up by the 'Black Boy,' as is worth anythink in Brissel." Miss Cobbe adds an amusing anecdote of her own experiences in this same unpromising locality, which is creditable alike to herself and to her penitent disciples:—

One winter's night when it was raining heavily, as I was passing through Lewin's Mead, I was greeted by a chorus of voices, "Cob-web! Cob-web!" emanating from the depths of a black archway. Standing still under my umbrella, and looking down the cavern, I remarked, "Don't you think I must be a little tougher than a cobweb to come out such a night as this to teach such little scamps as you?" "Indeed you is, mum; that's true!" "Well, don't you think *you* would be more comfortable in that nice warm schoolroom than in this dark, cold place?" "Yes, 'm, we would." "You'll have to promise to be tremendously good, I can tell you, if I bring you in again. Will you promise?" Vows of everlasting order and obedience were tendered, and, to Miss Carpenter's intense amusement, I came into St. James' Back, followed by a whole troop of little outlaws reduced to temporary subjection. At all events, they never shouted "Cob-web" again.

So thorough and hearty was Mary Carpenter's devotion to her rough and often uphill work, that a gentleman who contemplated it—from a considerable distance—thought "it was, after all, just like fox-hunting." She got up as cheerfully on a cold winter's morning to look after some hopeful little pickpocket as he got up to follow the hounds. But it must not for a moment be imagined that her view of her self-imposed duties, however cheerily she discharged them, was not a deeply and even passionately serious one. It was to her the one end of existence, and she could conceive no higher or more pressing obligation than to turn any one of those poor little sinners from the error of its ways. On one occasion she was deploring that everybody would not agree to give his undivided attention to "*the* great cause of the age," because, if they *did*, it would at once be carried. But what is the great cause of the age? was the universal exclamation. Was it Parliamentary Reform? or Woman's Rights? or Teetotalism? or Abolition of Slavery? or what? "Why," she replied indignantly, "the *Industrial Schools Bill, of course.*" It is by such singleminded and unselfish enthusiasm as this that great reforms and beneficent conquests are achieved in the world. And Mary Carpenter was as completely absorbed, heart and soul, in the moral and spiritual culture of each individual child that came under her care as though there had been none besides, nor did any want of responsiveness on their part daunt her or tempt her to desist from the task of what she was wont to call "mothering" these waifs and strays of society. Her interest was in the children themselves, and did not evaporate, as sometimes happens, in an official interest in the Institution. One characteristic story we must subjoin in conclusion, which shows that, while her whole tone of mind and way of regarding her life-work was not only an intensely earnest but an intensely religious one, nobody could have a keener discernment of any sort of cant or a more hearty contempt for it:—

She told me one day of her visit to a celebrated institution, said to be supported semi-miraculously by answers to prayer, in the specific shape of cheques. Miss Carpenter said that she asked the matron (or some other official) whether it was supported by voluntary subscriptions. "Oh dear, no, madam," the woman replied; "do you not know? It is entirely supported by prayer." "Oh, indeed!" replied Miss Carpenter. "I dare say, however, when friends have once been moved to send you money, they continue to do so regularly?" "Yes, certainly they do." "And they mostly send it at the beginning of the year?" "Yes, yes; very regularly." "Ah, well!" said Miss Carpenter, "when people send me money for Red Lodge under those circumstances, *I enter them in my Reports as Annual Subscribers.*"

LOCAL STEEPLECHASES.

NEXT to the sacred festival of the Bank Holiday ranks the local steeplechase in the estimation of the country bumpkin. It is a feast day of stricter obligation than even that of the county ball, the agricultural show, or the confirmation. We have long ago become weary of hearing the Derby spoken of as the Carnival of Great Britain, but we believe that the local steeplechase might with more justice be described as the grand festival of English country life. Against flat races many people protest, and spasmodic efforts are occasionally made to put down nearly every regular race meeting in the country. If the principle of local option were applied to races, the lives of very few meetings would be worth twelve months' purchase; but with steeplechases it is far otherwise. The latter are absolved on the convenient plea of being "very different things," and even the clergyman often connives at them, if he does not actually attend them in person. Some few of us may perhaps remember the time when local flat races stood on much the same footing, when horses were trained at home, and two-mile heats over hilly courses were the fashion. We recollect a divine of the old high-and-dry school who always attended the races which annually took place near his comfortable rectory. On the Sunday preceding the meeting he used to take occasion when in the pulpit to deliver himself of a kind of *apologia* for the institution, and as regularly as the year came round he endeavoured to prove from a well-known passage in holy writ how it was evident that St. Paul "and the other gentlemen of his day" were in the habit of attending the races of the period. He was careful to point out that, although there was no harm in going to races, there was serious harm in heavy gambling and excessive beer-drinking—sins that he had no mind to. The days of this good man are long since ended, and in these times the general consensus of opinion among the steady-going leaders of rural opinion seems to be that flat races are wrong, but that steeplechases are right.

The first symptom of the approach of the annual steeplechase is the appearance of small account-books and pencils in the hands of certain of the sportsmen of the neighbourhood. When out hunting and in the country towns, these gentlemen go to all their acquaintances and ask for a subscription to the coming steeplechase. At the meets of the hounds, dirty-looking light-weight boys appear on long-tailed well-bred horses, which horses are destined to be described for the future as having been regularly hunted with the Slopperton Hounds; and those who value the soundness of their own limbs or those of their steeds will do well to give them a wide berth, for, being unaccustomed to the hunting-field, they frequently lash out furiously with their hind legs when other horses approach them. Here and there, in large grass-fields one sees some bushes, brambles, and two or three hurdles made up into an artificial fence, over which the farmers train their horses—an unmistakable sign of an approaching steeplechase. Many a hunting man puts one of his best horses on one side to be trained for the great event. Endless councils of war are held with stud grooms about the training of these champions, and their condition and the state of their legs become more interesting for a few weeks than all domestic and foreign politics put together. A crowd of husbands, wives, sisters, and brothers anxiously watch the steeplechase horse taking a gallop round a large field, and unless he goes absolutely lame, or roars like a bull, they are all in ecstasies at his performance, and are convinced that his victory is a moral certainty. Between the owner, the stud groom, and the advice of friends, the chances are strongly in favour of the horse's being galloped till he breaks down, and if he does not break down, it is not unlikely that his wind will be affected. As regards the jockey there is often a battle royal. The owner wants to ride himself, but his wife or mother won't let him. There is much finessing on both sides. The terrified female relative believes that her husband or son "will not really be so cruel when the time comes, but that it is better not to say too much about it"; the would-be jockey, on the other hand, thinks that if he keeps quiet his female guardian will eventually give way. As the time approaches, the strain becomes too great and there is a grand climax. Tears are copiously shed, and the "if-you-love-me-you won't-do-it" argument is resorted to. If the jockey is the father of a family, he is asked whether he has a spark of affection for his offspring remaining, and his wife declares that if her husband rides, nothing will induce her to go to see him, and that she will spend the whole day locked up in her room weeping bitterly on her knees while her unfeeling spouse is enjoying himself.

The local steeplechase is one of the few occasions for which country houses are filled with guests. It is a kind of general picnic, and it occupies the whole party from breakfast time until dinner, which is saying not a little, while it affords food for conversation during the evening before and the evening after. Few entertainments are more dependent upon the weather. Many steeplechase courses are selected near rivers, because the land adjoining them is often flat, while the surface is covered with grass, and, the pasturage being rich and suited for cattle, stiff ox fences divide the enclosures. Consequently when there are unusually heavy rains, it sometimes happens that the course is flooded by the overflowing of the river, and the affair has to be put off. The most popular conveyance for use at steeplechases is a large break. Many of these carriages crowd the roads on the morning of the race, filled with people wrapped up in cloaks and ulsters, while large luncheon baskets peep between the legs of the coachmen and footmen on the boxes. There are landaus and broughams; but smart carriages seem singularly out of place when careering through the mud, and over the ridge and furrow which usually has to be traversed before the point is reached from which the race is to be witnessed. There are also farmers' shandry-dans of all descriptions, with women attired in gorgeous bonnets sitting in the back seats, the general characteristic of the vehicles being that they are in the condition technically known as "out of trim." When a carriage has been driven on to the course there is a rush of men to take out the horses and the pole and push it into a favourable position. There are bumps and jostlings, but at last the machine is brought to anchor. At the time of year at which the greater number of these steeplechases take place there is generally a cutting easterly wind, and as the spot usually chosen for the spectators is the crest of a hill, all the surroundings are eminently calculated to produce bodily discomfort in the present and influenza in the future. It not unfrequently happens that there is a heavy downpour of rain throughout the proceedings. The turf about the carriages then becomes trodden down until it is a sea of mud, and universal misery is the consequence. Boots, trousers, and dresses are soon saturated with wet and loaded with damp clay. But we will not dwell on these horrors. Be the weather wet or fine, there is generally confusion in the saddling tent. After months of anxious preparation, the amateur jockeys and trainers seem to have left everything of importance to the last moment, and every one who is concerned either directly or indirectly with the race appears to be in a fuss. To add to the confusion, one rider has failed at the eleventh hour, and a substitute has to be procured and thrust into boots, breeches, and racing colours which do not fit him, at even greater speed than his horse is likely to carry him. There is something wrong with one man's stirrup leathers, the girths of another are cracked, and a third has left his saddle-cloth and weights at home. When in racing costume, the varieties of make and shape of the British gentleman are very conspicuous, and the peculiarities of the lean and the fat are revealed in all their glory. At last the group of horsemen are started. As they clear the first fence, the spectators give the sort of roar of admiration which is heard at a display of fireworks when a large rocket is sent off. When one horse refuses at the second fence there are shouts of laughter, and when he refuses again the populace is even better pleased. If, when chastised for his misbehaviour, the brute takes to kicking, there are screams of delight. When he at last gets over the dreaded obstacle all eyes are turned to the little party of leading horses which are now in the distance, the colours of the jockeys bobbing up and down over the ridge and furrow, or gliding with apparently little effort over the fences which come in their way. There is now a general rush to the water-jump, which the competitors have to negotiate on their course the first time round. Spectators crowd on either side of this artificial arrangement, hoping to see a good splash or roll, some broken bones, or even perhaps a corpse. Presently the leading horses come in sight and rapidly approach the sham brook, agony being depicted upon the faces of their riders. As each animal bounds over there are more sky-rocket roars of approval among the spectators. In most cases the worst that happens is that some of the horses drop their hind legs into the water where it is only a few inches deep—indeed the water-jump is often one of the safest fences in the whole course. A few fields further on a horse is seen to be riderless, but a cry of "he's up" relieves the minds of those ladies who would consider it the proper thing to be greatly shocked if any one were to be seriously hurt. Three fields from home there are only two horses left in the race, one of which refuses, and the winner comes in absolutely alone, the finish being not unfrequently the tamest part of the business. There is immense cheering, and the course is crowded, when two of the field, whose very existence had been forgotten in the general admiration of the winner, come galloping in among the people, making a very pretty race for second honours. The crowd scatters as if a shell had burst among them, and one man is knocked down and injured; but, as he was not riding in the race, he somehow or other is not supposed to count.

An interval then follows for luncheon. There is an unpacking of hampers and a spreading of white cloths on box seats, moveable tables, and ladies' knees. The parties belonging to the different carriages come flocking back like chickens to a hen, and a great feast begins. Accidents will happen at steeplechase luncheons, but they are supposed to add to the fun. The bottle of salad mixture has broken in one hamper, and its contents have permeated all the other eatables. A large dish of mutton pies has been upset by a clumsy servant, and the pies have rolled under the carriages. An eager groom, who is acting as a temporary footman, has put his foot into a mayonaise, and a gentleman on the box of a landau has upset a bottle of champagne among four ladies who are sitting in the carriage below. We never understand why it is that people drink champagne at race luncheons who scarcely ever drink it on any other occasion. When the Englishman is celebrating high festival he considers it the proper thing to drink champagne and eat lobster salad; champagne and lobster salad consequently appear in profusion at all our steeplechases, ball suppers, and wedding breakfasts. The worst of it is that the champagne which flows so copiously at steeplechases is often very bad, and wise men and women will fight shy of fluids passing under that name on racecourses. Plenty of luncheon, much small talk, and a little racing make up the grand total of most local steeplechases; while their after consequences are a great number of bad colds. Like other amusements, they have their drawbacks; but, as amusements go, local steeplechases are not, as boys say, bad fun.

THE MEDIÆVAL ABBESS.

We have no mediæval chronicle by an English nun of an English nunnery. The female historian is a product of modern culture, and we might in vain look into the convents or the castles of olden time for an Agnes Strickland or a Mrs. Everett Green. While Simeon of Durham, William of Malmesbury, Jocelin of Brakelond, the monks of St. Albans, and many more of the cloistered brotherhood were diligently preparing their respective narratives of the past, or recording events that were happening around or within their chapter-rooms, we do not find a single female recluse relating the incidents of her conventual life, or even becoming the historian of the mystic strivings and communings of her own poor soul. Such literary lady abbesses as Bokdovina of Poitiers, Heloisa of Argenteuil, Hrothswitha of Gandersheim, or Hildegarde of St. Rupert's Mount, find no likenesses in the convents of England; and it was St. Teresa of Avila, and not a glorified virgin of English origin, who by her soul-piercing glances and seraphic outpourings attracted the "consecrated kisses" of Crashaw's muse. We need not suppose that all the communities of religious women were like the sisters of St. Mary de Pree, Herts, so uneducated that they could neither read nor sing, for their case was confessed to be exceptional. There were few nunneries where the inmates could not sing anthems by note in the chapel choir, as well as "chant faint hymns to the cold fruitless moon" in the cloistral walk; but it must be owned that the genius of the English nun has not impressed itself on our minds in a literary form. It is true there is the treatise on Hawking, attributed to Juliana Barnés, Prioress of Sopewell, a cell of St. Albans; and it is possible that in the

scandalous destruction of the monastic libraries at the suppression of religious houses some writings of female authorship may have perished, a fate from which Wynkin de Worde secured Juliana's book.

If we may estimate the loss of the literature of the nunneries by analogy with the destruction of their material fabrics, it would seem to be enormous. Of the Benedictine monasteries there are many noble remains, but of the nunneries of that Order almost the only complete church of importance is Romsey Abbey, a building that sheds its dignity over the whole county of Hants. Besides this, there exist a few chapels which have been converted to parish uses, such as St. Helen's, Bishopsgate, and the Norman church of Elstow; also there are the stately thirteenth-century columns of Whitby, and the interesting buildings of Lacock in Wilts; but of the seventy-nine nunneries which once gave their picturesque forms to the landscape, the vestiges are now mostly confined to the foundation-charters by which the abbesses held their estates and privileges. A study of these humble-looking documents will help more to recall the former significance of the institutions they represent than even the visible grandeur of the architectural remains of some famous abbey of which kings were the founders and queens the nursing-mothers.

The first Benedictine nun was St. Scholastica, St. Benedict's sister, who about A.D. 543 founded a convent on Monte Casino. The first English nunnery was instituted at Folkestone, A.D. 630, by King Edbald, for his daughter Egwitha, whose haloed head is now on the town seal. The original charter of that house has perished, but Capgrave has preserved a notice of the foundation. One of the earliest English documents extant is a charter granted to Barking Abbey by Ethelred, King of the West Saxons, A.D. 692. It is undoubtedly genuine, and has been reproduced in the first volume of *Facsimiles of Ancient Charters* from the Cotton MS. Barking was conspicuous for royal nurture, and among the illustrious ladies who followed one another in the government of the Abbey were Oswyth, daughter of Edifrith, King of Northumberland, Ethelburgha, wife of Ina, King of the West Saxons, who was afterwards canonised, and Cuthburgha, sister of the same Ina. Elfrida, the widow of King Edgar and mother of Ethelred, after ejecting Wulfhulda, a beautiful nun of Wilton whom Edgar had seduced, took upon herself the conduct of Barking Nunnery; and Maud, wife of King Stephen, for a short time governed the same house. During the oversight of Adeliza, who succeeded Maud, Stephen and his whole court were entertained for several days in this convent, his queen, the late abbess, being among the company. In the Cotton Library is a charter with the Great Seal attached, which is dated at Barking and witnessed by the nobles present. As some atonement for the massacre of Archbishop Becket, the sister of that prelate was placed by Henry II. at the head of Barking Abbey, a dignity which made her one of the four greatest abbesses of the land, the three others being of Wilton, St. Mary's at Winchester, and Shaftesbury. We may cite Canon Venables's article "Abbess" in the *Encyclopædia Britannica* for the statement that the office of abbess was elective, the choice being by the secret voting of the sisters from their own body, the elect nun being afterwards solemnly ordained by the bishop. This was certainly the regular form, but distinct charters show that there were modifications in practice. At Barking the abbess was appointed by the King until about A.D. 1200, when by Papal decree the election was vested in the convent and confirmed by Royal authority. Bishop Gundulph, the founder of Malling Abbey, Kent, is reported to have governed that house himself, and to have appointed Avicia, the first abbess, only when on his death-bed. Kilburn, in Middlesex, was founded by Walter Abbot, of Westminster (ob. 1191), who assigned the manor of Paddington to the almoner of the Abbey for the provision of doles at the celebration of his anniversary. The Abbots of Westminster were prescriptively exempt from episcopal jurisdiction, an immunity which was also asserted for their dependency of Kilburn. This claim led to discord between the head of the diocese and the mitred dignitary of Westminster. To decide the dispute, Roger, Bishop of London (A.D. 1225), referred the question to the Papal Court. The result was that the prioress of the house, though appointed by the abbot, was ordered to be obedient to the bishop, who was to have access to the cell of Kilburn, to be received with procession, to preach, hear confession, and enjoin penances. The regulation of the house belonged to the abbot, and that he was not invariably severe in all the details of domestic arrangement may be inferred from the fact that the last prioress's chamber was furnished with eight pillows of down, and its walls were hung with green and red silk enriched with figured borders. Before the nuns of Langley, near Bredon, Leicestershire, could elect their own prioress, the permission of the lay patron was to be obtained, who on such occasions sent a page with a white staff to guard the door of the priory till the election was over, a process not unlike the election of the Pope. Thomas de St. Walery, lord of Ambrosden, the son of the founder of Studley Nunnery, Oxfordshire, in confirming and enlarging the privileges granted by his father, made a provision that the Prioress of Studley should always be elected with the approbation of himself and his heirs, or of his seneschal, should he be absent from England; but after the election she was to be presented to the Bishop of Lincoln. She was then to do fealty at her secular patron's Court. Stamford Abbey, in Northamptonshire, was subordinate to the Abbey of Peterborough, and was built in the time of Henry II. for forty nuns. It was an annual custom on the morrow of the Feast of St. Michael for the prioress and some of her sisters, in the name of the whole convent, to render, either by word or in writing, under the convent seal, a recognition of their subjection to the abbot. This was a less generous ordination than that enjoyed by the nuns of Annethwaite, in Cumberland. The good works of William Rufus are thought to be limited in number; but among his pious acts was the foundation, in the second year of his reign, of that convent, which he dedicated to Christ Jesus and His mother Mary. The privileges of the nuns were to be the same as those of the monastery of Westminster, and their lands to be held as freely as "hert may it thynk or ygh may it see," which is a bit of epigrammatic English inserted into the twelfth-century Latin charter.

The coming woman, when emancipated from home and husband, and raised to a seat among the lawgivers at Westminster, will have regained only a part of the authority formerly possessed by certain of her kindred. The mediæval abbess, in the midst of her devout family, was endowed with prerogatives which might satisfy the utmost greed of the votary of Social Science of the present, but which the latter will no more recover in full for her sex than Isis will again gather into one body the alienated limbs of the good Osiris. It might hardly be suspected that so advanced a stage of feminine rights had been reached more than five centuries ago as that women should be invited to co-operate with bishops and barons at the National Council. Fuller, indeed, says in his *Church History* (Book VI.) that abbesses, though holding baronies, "never were summoned as baronesses to Parliament, because that honour was never conferred on any ecclesiastical female." A reference to Palgrave's *Parliamentary Writs* (vol. i. 164) will show that certain abbesses were not only theoretically entitled, by their territorial importance, to a seat in the Legislature, but that they were actually required to attend, at least on one occasion, with the great abbots, prelates, and secular magnates, the King's Parliament at Westminster. The business was to treat upon an Act for conferring knighthood on the first Prince of Wales with three hundred of his companions, and the Abbesses of Shaftesbury, Barking, Wilton, and St. Mary's Winton were summoned "*in propriâ personâ*" to the consultation. A grand religious ceremony closed the proceedings, when the crowd was so dense at the Abbey that two knights were killed in the crush, and the Prince could only find room to go through his part of the ceremony by standing (so it is said) on the high altar.

The agitation for women's rights, at least in the form of the assertion of some specific claims which might seem prescriptive only to certain classes of men, dates many centuries back. The spiteful frenzy of the platform aspirant to masculine privileges is suspiciously modern. More convincing than passionate outcries against oppression was the authority of the vellum deed with its *inspeximus*, sealed with the seals of successive monarchs, which the mediæval abbess coolly brought before the Royal Commissioners who demanded the antecedents of her tenure. Whether the contracted Latin of her charters was always intelligible to the abbess herself may be questioned, but she had at hand some learned chaplain or lawyer who could unfold its mystery. For instance, we find a generous expounder of the muniments of Godstow Nunnery, whose reason for affording a translation of these documents was, he says, that "women of religion in reading books of Latin be excused of great understanding where it is not their mother-tongue."

Among the prerogatives asserted by the Benedictine Abbess of Wroxall, in Warwickshire, was the right to hold a court leet and to erect its natural appendage, a gallows, both in Wroxall and Hatton, which claims were brought into question at the time of the inquisition of Edward I. into manorial customs. In the *Placita de quo Warranto*, however, it was proved that the pretensions in question had been confirmed by Henry II., Richard I., John, and Henry III.; they were consequently allowed by the greatest of the Plantagenets. Godfrey Gifford, Bishop of Worcester, made in his old age a visitation of Wroxall, and preached upon the text, *Non est talis mulier super terram*. There were, however, many such politically privileged abbesses as the lady he addressed on one Eve of St. Luke. The Abbess of Malling was one of those who in the *Placita* (6 Edward I.) renewed their pretensions before the royal justiciaries to enormous liberties and franchises. Besides the minor prerogatives comprised in the assize, or correction of abuses in the supply of bread and ale, and the holding of periodical markets and fairs, she claimed to have "view of frank-pledge," that is, the office usually held by the county sheriff, to take the oaths of young freemen in order to see that each was settled in some tithing which was collectively answerable for his fidelity towards the king and his subjects. The Abbess also vindicated an immemorial right, which King John had confirmed, to the nuns of St. Mary de Malling, that they should hold all their lands freely and unmolested, with the liberty of keeping court or holding trials within their jurisdiction, including the right of *furcas*, or to condemn malefactors, if men, to the gallows, or, if women, to be drowned in the nearest pool or river. In a similar manner the Abbess of Godstow (9 Edward V.) claimed view of frank-pledge, the assize of bread and ale in Eton, and the right of gallows on their own land, "without the license and will of our Lord the King."

Whether the powers of the abbess extended to the entombing alive of erring sisters, as we are taught to believe in *Marmion*, may be open to question. The picturesque voyage of Abbess Hilda with her holy maids to Lindisfarne, and the tragic issues announced by the passing knell that swung over the midnight wave to the answering rock of Northumbria, causing the Warkworth hermit to tell his beads with increased devotion, and frightening the stag

on Cheviot Fell, are poetical fiction—"merely this and nothing more." We doubt whether there is an authenticated instance in Christian annals of any such tragic entombment. We remember an honest clergyman of the most pronounced Protestant type, who proposed to intensify the already sufficient charges of cruelty against a corrupt Church by adding to the treatises he had already written a paper on instances of offending nuns being committed to the grave while in health and vigour; but, after a painful search among home and foreign historians, our zealous friend was obliged to rest satisfied with the doubtful note on the subject in Sir Walter Scott's poem. Here we may touch upon the difference in the story of the wrongdoing of Marmion, as told in a document to be found in Dugdale, compared with the account with which Scott has made us familiar. According to the former narrative the Conqueror gave to Sir Robert Marmion the town and castle of Tamworth, with much surrounding district. The Abbey of Pollsworth being within the territory thus conferred, Sir Robert "chased away" the Abbess Osryth and all the ladies of the house of Pollsworth, so that they retired to their cell of Woldbyry, and stayed there nearly a year. Within that space Marmion made a great gathering at Tamworth Castle of earls and barons and fine ladies. The feast being over and the guests retired to rest, Lord Marmion was visited in his sleep by a nun with a cross in her hand, who said to him, "Yield to me and my sisters my lands and my tenants, the which King Egbright my father me gave, or you shall have an evil end, so shall you go into hell." Lest he should confound a reality for a dream, the lady smote him in the side with the point of her cross, and so vanished. With a sharp cry he awoke, and calling his lords, they recommended confession to a priest, and the priest ordered the restitution of the abbey to the nuns. Sir Robert Marmion and the other great lords who were at the gathering accordingly rode on the morrow to the cell of Woldbyry and brought again Oswyth and her sister to their former abode; restoring to them at the same time their lands and tenements unto the "leyst alpurth of godys." This restoration to the "last half-pennyworth" may be applied analogically to the Sisterhood of Mr. Jacob Bright in their demand to be reinstated in their Parliamentary sphere, whence subjected woman has for many days been estranged.

BRITISH DECORATIONS.

IT is related that Napoleon I., when setting foot upon the British man-of-war which was to convey him to St. Helena, was particularly impressed with the appearance of the marine guard of honour drawn up on the quarter-deck to salute him. He inspected it carefully; and, noticing the total absence of anything like decorations among the men, inquired whether none of them had seen any service? On being informed that there was hardly a man present who had not been repeatedly engaged, he exclaimed, "What! plenty of fighting and no medals! that is not the way to encourage the military spirit." Possibly not; but we would venture to observe that just then the military spirit, with us at any rate, required but little encouragement. We had, in fact, at that moment barely concluded twenty years of well-nigh incessant war with the chief naval and military Powers of the world; war that was waged by land and by sea in every quarter of the globe, and in which our soldiers and sailors alike had achieved an almost unbroken succession of victories and triumphs to which, by the admission of the historians of our then bitterest foe, there is hardly a parallel in history. Nor was the martial spirit confined to the actual combatants; the nation at large participated in it to the full. Challenges to fight were thrown down and accepted on the smallest provocation and without a moment's hesitation, supplies were voted with enthusiasm, and the accumulation of a national debt eclipsing in magnitude anything that the world had then seen was viewed with indifference and regarded as of secondary importance to the honour and success of our arms. And yet not a single decoration was to be seen among the rank and file of our fleets and armies, and very few among the officers; even those few being principally the gifts of foreign potentates. As we shall presently see, we have since made up for lost time in this respect; but, whether the martial spirit has been thereby stimulated among our soldiers and sailors, whether they fight better now than in days of yore, is a question upon which our readers can form their own opinion.

Although, according to a well-known authority—the author of *Medals of the British Army*—decorations for military service date back as far as 1643, there was no regular issue of them, and in later times the only decorations to be seen in our army were granted by foreign monarchs. For instance, in 1794 Pope Pius VI. presented gold medals to certain officers of the 12th Lancers, in recognition of the good conduct of a detachment of that regiment which was quartered at Civita Vecchia; and in the same year gold medals were presented by the Emperor of Germany to the officers of two squadrons of the 15th Light Dragoons (now Hussars) to commemorate their devoted gallantry at Villiers-en-Couche. The first general issue of a medal was that granted for Waterloo, which was authorized in March 1816, and was presented to all officers and men who had served in that campaign. It appears strange enough to us that no recognition was made of the long series of military and naval battles which occurred during what is known as the revolutionary war; but, in spite of repeated efforts, it was not until 1847 that the injustice of the omission was recognised, and on the 1st of June in that year it was announced in orders that "Her Majesty had been graciously pleased to command that medals should be struck to record the services of her fleets and armies during the wars commencing in 1793 and ending in 1814, and that one should be presented to every officer, non-commissioned officer, and private or seaman who was present in any battle or siege to commemorate which medals had already been struck by H.M.'s predecessors and had been conferred upon generals or superior officers." In March 1851 another order appeared, announcing that Her Majesty had approved of the application of the East India Company to grant a medal for services ranging from the storming of Allighur in 1803 down to the siege of Bhurtpore in 1826, and further confirming the grant of certain medals already awarded by the Company. The ice once broken, the stream of decorations set in, and has continued to flow with increasing force ever since. Colonel Brine, R.E., has tabulated and arranged them as far as possible in chronological order on a single sheet folding into a demi-octavo paper cover (Stanford), and we shall presently offer a few remarks on the execution of the work. In the meantime we may summarize the details by observing that there are now in existence seven British Orders available for the sterner sex, both civil and military; namely, the Garter, the Bath, the Thistle, the St. Patrick, the Michael and George, the Star of India, and the Indian Empire; and to these we may add the Guelphic Hanoverian Order. For the softer sex there are the English Maids of Honour, the Victoria and Albert, the Crown of India, and the St. Katharine for nurses—the last-named, by the way, being jet-black, a colour which we should have thought more suggestive than appropriate in an hospital. Of purely military decorations awarded for various campaigns or wars, we have fifteen—namely, the military war-medals for services between 1801 and 1814, the gold medal and the gold cross for certain battles in the Peninsular war, and the following medals:—the Waterloo; the South Africa (three wars, exclusive of the Zulu war); the China (three wars); the Afghan, Scinde, and Gwalior; the Sutlej; the New Zealand (three wars); the Punjab; the Indian or Frontier medal (which includes one Persian, three Burmese, and endless little wars, such as the Umbeyla, Hazara, Looshai, Jowaki, and Perak campaigns); the Crimean; the Mutiny; the Abyssinian and the Ashantee medals. In addition to the above, there are various military decorations for exceptional or gallant services, such as the Order of British India for native officers, the Indian Order of Merit for native soldiers, the Long Service and Good Conduct medal, the Distinguished Service medal, the Victoria Cross, the Empress of India commemoration medal, and the Best Shot of the Army medal. There are also eight different decorations awarded at various times by foreign potentates, such as the Legion of Honour, and the Turkish and Sardinian medals. Of purely naval decorations we have eight—namely, the Naval War Medal, 1793 to 1840; the Naval Gold Medal, 1794 to 1815, for superior officers; the Arctic Discoveries; the Good Conduct; the Baltic; the Conspicuous Gallantry; the Arctic Medal, 1875-76; and the Victoria Cross, which in the navy is suspended by a blue ribbon, whereas red is worn by the army. Wherever our land and sea forces co-operated, as in the Crimea, China, &c., the navy received a medal similar to that awarded to the army. Lastly, there are sundry medals open to all classes, such as the Royal Humane Society; the Royal Lifeboat Institution; the Shipwrecked Mariners; the Tayleur Medal, for saving life at sea; the Albert Medal, for saving life by land and by sea (two classes); and the St. John Ambulance Order.

Every one remembers how Lord Macaulay, in his essay on Lord Clive, sneers at "the merest bauble, a medal, a cross, or a yard of coloured ribbon"; but it would take more than even a Macaulay's sarcasm to undermine the popularity which these things undoubtedly possess, at any rate with those who wear them. There is only one process which could deteriorate their value, and that unfortunately is precisely the one which is now in full force—that is to say, that, with our usual tendency to violent reaction, we are making them so common that they are rapidly becoming worthless. Take a single case, that of the C.B. Time was when this decoration was only conferred upon officers for some signal, exceptional, or meritorious service; and so long as this rule was observed it was in every sense a distinction as well as a decoration. Now it has become a sort of rule to confer it upon every officer who commands a regiment during a campaign, no matter how brief or bloodless its share may have been, and for such an officer not to receive it is tantamount to a mark of official displeasure, as a recent example in the Zulu war has clearly proved. Under these circumstances, though it may still be a decoration, it certainly is no longer a distinction. In the same way, every official who fills a post of the smallest responsibility in any of our colonies without committing any serious blunder during his term of office, expects, and feels himself aggrieved if he does not receive, the C.M.G.; and of late there has been a tendency to bestow this decoration on superior officers who serve in our colonial wars as a sort of supplement to the C.B. It seems strange that, although there is only one Imperial order for services rendered in our numerous colonies—namely, the Michael and George—no less than three have been created for India, namely, the Star of India, the Crown of India, and the Indian Empire. By the way, we notice in Colonel Brine's sheet that New Zealand has an order of its own; and probably other colonies will soon follow suit, until the number will become somewhat bewildering. Perhaps it would be as well to forestall the in-

advisable, and to institute one or two Imperial Orders for general use among our numerous possessions. Titles could easily be found; for instance, the "Star of Universal Dominion," the "Cross of Imperium et Libertas," or the "Order of the Empire on which the Sun Never Sets," would each and all, we think, be appropriate and withal attractive; but we merely submit these as suggestions. With regard to medals proper, we mean those given for service against an enemy by land or sea, there is much that seems open to objection in the system of award. They are lavished too freely and without sufficient discrimination; hence their value also is rapidly deteriorating. As a general rule, a medal is given to every man who serves in a campaign, and clasps or bars are added for every general engagement in which the wearer took part. Some of these, such as the Sutlej and Punjab medals, each with three clasps; the Crimean medal, with four clasps; and the Mutiny medal, with five clasps, all represent stern hard fighting, and, moreover, exposure to climate, and were well and fairly earned. Again there are other medals of a less pretentious nature, which nevertheless represent a considerable amount of irregular fighting and exposure to climate and disease, such as the first Burmese and Ashantee medals. On the other hand, sundry medals have been issued which represent neither danger from an enemy nor from any other source. The Baltic medal is an example. We equipped and despatched a magnificent fleet which did literally nothing. A few corvettes or frigates bombarded an isolated port here and there; but, unless we are mistaken, not a single line-of-battle-ship fired a shot in anger. Yet every sailor and marine in the fleet received a medal. Again, take the Abyssinian medal. Not a single man was killed in action during the campaign, or rather expedition, and only about fifty were wounded. Again, take the operations of the Peshawur Valley column in November 1878. The sole action in which it was engaged was the capture of Ali Musjid, which entailed a loss of 2 officers and 14 men killed, and 30 men wounded. Yet not merely a medal, but a special clasp, is to be awarded for this paltry affair, the said clasp being apparently intended to counterbalance that given to the Kuram Valley force for the action of the Peiwar. Considerations of this nature will frequently present themselves in military operations, and cannot always be ignored; but we fear that the value of the decoration is not raised by such concessions. The Crimean campaign has, however, more to answer for in this respect than any other. Here is a list of decorations worn by many officers now in the service who were not present at a single battle, having only landed in time for the close of the siege of Sebastopol:—Crimean medal, Turkish medal, Sardinian medal, Legion of Honour, Medijie, and C.B.

We cannot congratulate Colonel Brine upon the execution of his work; the very title is, in fact, misleading. For instance, if we wish to know what the Order of the Garter is like, we are confronted by a patch of blue paint and nothing else, which leaves us nearly as wise as we were before. A more correct title would have been "Ribbons of British Decorations," for that is all that Colonel Brine gives us. Nor are even these always correctly represented; for instance, the ribbon of the Bath is crimson, not light red, as given; the Sardinian ribbon is far darker than Colonel Brine represents it; and the beautiful Scinde and Gwalior ribbon is mutilated almost beyond recognition. Still it is the first attempt yet made in this direction, and perhaps we may some day be favoured with a more elaborate work. We have also to notice *British Naval and Military Medals and Decorations*, by Mr. J. Harris Gibson (Stanford). Mr. Gibson confines himself to purely military and naval medals and decorations. He makes no attempt at illustration, but his descriptions are nevertheless complete, exhaustive, and correct. The obverse and reverse of every medal, the ribbon by which it is suspended, the number of clasps accompanying it, and the service for which it was awarded, are all given in a clear, concise, and simple manner. In addition to the medals already noticed, Mr. Gibson gives us a long list of what may be called private medals, peculiar to various regiments or ships, which must have cost him considerable trouble and research. His list of naval battles and services, including as it does even boat actions, is the most complete and comprehensive we have seen. We have known many more ostentatious works, but none which more thorough[ly] merits success.

M. GOT'S DIARY IN LONDON.

M. GEORGES D'HEYLLI, who is known as the writer of various *brochures* and volumes connected with theatrical matters, has added to the list of his works a little book containing the diary, or passages from the diary, kept by M. Got when some of the Comédie Française came to London in 1871, and also the journal kept by M. Sarcey in 1879. M. d'Heylli opens his interesting compilation with an introduction which gives a brief account of the three journeyings undertaken by the Comédie, one of which in 1868 carried them through provincial France, while the others were the two visits to London above referred to. The difference between the first expedition and the second was marked enough. As soon as it was known that the Comédie was about to make a provincial tour, M. Thierry, who was at that time the administrator of the Company, was besieged by letters from mayors, prefects, and critics in various country towns, all clamouring for a visit; and of course those small towns which were left out of the route filled with indignation. One important place, Bordeaux, was singularly unlucky. M. Halanzier, who was at that time managing the theatre there, had made a contract with the Company of the Gaîté to run a *féerie* at Bordeaux for a time, which covered the leave of absence of the Comédie, and this contract it was impossible to break. Saving, however, a few such annoying circumstances as these, the whole tour, which, like that of 1879, was the result of extensive repairs going on in the theatre in the Rue Richelieu, was a complete triumph. The second absence of the Comédie from Paris took place under very different circumstances, and seemed at first as if it would have far less satisfactory results. Possibly, however, the fact that in the end it did save the Théâtre Français from the ruin which seemed to threaten it may be held to have made up for the difficulties and discouragements encountered at the outset. These were not few. There was only one theatre available at the time for the purposes of M. Got, who headed the expedition; and the smallness of this house—the Opéra Comique—made it necessary to announce prices which, at that date, were thought somewhat high. There were other difficulties to be got over; and, while the fifteen players of mark who came over to England had these to contend with, their comrades in Paris fared no better. On the 11th of May M. Thierry wrote to M. Got:—"Je suis comme vous; j'ai bon espoir dans le succès de vos efforts et de ceux de vos camarades. . . . Quant à nous, nous faisons, comme vous à Londres, des raccords et des répétitions à n'en plus finir. Vous savez probablement que Boudeville nous est venu en aide. Avec lui nous avons eu *Le Menteur*, où il a joué le rôle de Cliton, et nous allons avoir *Le Mariage de Figaro*, où il jouera Antonio. Un jeune comédien du théâtre de Cluny qui se nomme Richard s'est mis aussi *pour l'honneur* à notre disposition, ce qui nous fait à peu près deux amoureux, car nous n'avions qu'un, hélas! nous n'avions que Charpentier pour la tragédie comme pour la comédie, et nous ne pouvions pas même jouer les deux actes du *Dépit Amoureux*. Il n'est pas possible de se figurer une plus étroite pénurie." It is not stated whether this young actor was identical with the M. Richard who was playing not long ago at the Français, and who, if we remember rightly, appeared in London last year. The letter goes on to say that the audience is numerous, but not lucrative. The National Guard found visits to the theatre an agreeable distraction, and the municipality of the first arrondissement sent in a tragedy to be played. M. Thierry objected that there was no reading committee. "We will find you one" was the answer; and the further objection that there not enough actors at hand was met in the same way It does not seem, however, that the tragedy was ever performed.

M. Got's diary, which in the first instance was never meant for publication, is in various ways full of interest, and he seems to have had more than enough to do all the time. On the 19th of April, having started his arrangements for the season and left M. Bressant to see them carried out, he returned to Paris, and found himself put up to play *Le Duc Job* the very next night, and for one or two nights following before his return to London. His remarks upon the first performance of the play just named in London are characteristic, and his criticism on the piece is perfectly just:—"Spectacle, *Le Duc Job*. Recette, 4,100 fr. Voilà qui semble remonter, mais cela ne durera pas. Non. La pièce est jouée trop faiblement; les premiers interprètes ont vieilli depuis douze ans, dame! . . . Et les nouveaux ne sont pas toujours bons, et ne s'en doutent guère. Et puis la pièce, si honnête et bien pensée qu'elle soit, est écrite dans une espèce d'argot, demi-boursier, demi-rapin de la haute, qui doit être inextricable pour les oreilles anglaises." It is curious to contrast the account of the next performance—*Le Misanthrope*—with M. Sarcey's description of the reception of the same play eight years later at the Gaiety. M. Got wrote, "Je m'en doutais bien avec ce diable de *Misanthrope*. Mes camarades avaient beau dire! Pourquoi Londres s'intéresserait-elle à ces sublimités toutes morales davantage que Paris?" M. Got seems to underrate this great play, and the public which listened to it on the first night of the 1879 visit contradicted his notion that it could not be appreciated in England. M. Sarcey, in a passage which bears amusing marks of his amiable delight at finding that London was not inhabited by savages, wrote of it thus:—"It was to be feared that *Le Misanthrope* might prove a trifle wearisome. Between ourselves, this play is not always a source of unmixed delight even in Paris; one listens to it with respect, but without enthusiasm. What chance, then, would it have with an audience which, however intelligent and educated, could not be as familiar as we are, whether with the court manners of the time or with the delicacies of our language? Well! It is an astoundingly improbable fact which I state, without trying to explain it, that *Le Misanthrope* had a prodigious effect. Nor was the applause premeditated. It was not a case of a whole audience that had agreed to hide its ignorance and boredom with polite bravos. Not at all; people laughed in the right places, and marked their knowledge of them with that little buzz of contentment which rises from stalls to boxes, and cannot have been prearranged."

To return, however, to M. Got's diary. It is to be regretted that he has, from excellent motives, omitted what would have been a most interesting account of his hurried journey to Paris, on the 20th of May, to see after his parents' safety, and of the perils which he encountered during his stay there. All that we hear of these is contained in his account of how, on his arrival in London again on a Sunday morning, he immediately bought an *Observer* to see what had been going on during the week. "Performances,"

he writes, "had been given every evening by our company, and the paper was filled with details, fortunately somewhat more terrible than true, of events in Paris. Amongst other headings was this—'M. Got Shot.' How on earth could this news arrive before I did?"

Shortly after his return *Mlle. de Belle-Isle* was represented. As to this, as well as to other pieces, M. d'Heylli, in his introduction, makes some pertinent remarks. "How curious," he says, "were the casts of the pieces, given all of them by the same fifteen players! For instance, in *Le Dépit Amoureux*, which in Paris serves for a *lever du rideau*, and is generally entrusted to *pensionnaires*, there appeared in London MM. Got (Mascarille), Delaunay (Eraste), and Coquelin (Gros-René). In *L'Honneur et l'Argent* the all but dumb parts of friends and creditors were played by Bressant, Febvre, Boucher, and even the *régisseur* Chevallier, who came on to increase the crowd. In *Le Misanthrope* we have Got playing L'Exempt and Mlle. Favart Célimène. Coquelin appears as the dancing master in *Il ne faut jurer de rien*, and Talbot in the same piece as a tavern-keeper with a few lines to speak." In the *Barbier de Séville* Febvre played the little part of the notary, and Garraud that of l'Eveillé, while in *Mercadet* Delaunay appeared as Méricourt, and Coquelin as Justin. Other pieces are quoted to illustrate the curious fact of London audiences having seen "casts" more interesting, in the way of the smallest parts being filled by the best actors, than have ever been presented in Paris.

It would be tedious to remind readers how different not only in this, but in many other matters, was the latest visit of the Comédie to London. Then the way was smoothed for the success which was from the first assured. It is, however, generally more interesting to read of a successful struggle with difficulties than of a success never interrupted; and there is more pleasure to be got from M. Got's diary of jottings than from M. Sarcey's elaborate and self-conscious platitudes.

CITY PAROCHIAL CHARITIES.

"BEATI possidentes," said Prince Bismarck; but, true as the saying may be in the territorial affairs of great States, it is not so universally true of the subjects of those States in relation to the property which they may possess. The landowner in England is now told by Mr. Gladstone that he holds his possessions only at the will of the Parliament of the day; the fundholder of a generation or two ago lived in daily fear of "the sponge"; the Irish Church in our own time held its revenues by a better title than that by which Woburn is held by its owner, but Black Care sat behind it, and a great defender of the Church arose who swept those revenues away and devoted them to the benefit of idiots and lunatics. In like manner the great City Guilds hear not without trembling the threatening murmurs which Liberals—other than Liberal members for the City—are wont to raise on the subject of the great estates owned and administered by them; lawfully owned and well administered, no doubt, but which not the less offer an irresistible temptation to a certain class of politicians, who, like the hypochondriac, cry always, "We were well; we would be better," and in the result seldom realize their wish.

Among other *possidentes* to whom their possessions are, now at least, no great blessing are the owners of those funds whence proceed the charities that give a heading to our article. They also, in most cases, hold their property by a perfect title, and appear to have administered it for the most part fairly and equitably for the benefit of those to whose use the piety of former ages had destined it. The great difficulty in their way—that which has made their possessions rather a *damnosa hereditas* than a benefit—is that the recipients of the charities, either by operation of law, by the advance of civilization, or by a change in the habits of the people, have in great measure perished from out of the land; and that, though legal ownership still exists in the persons of the trustees, the funds have frequently no real owner, by failure of the *cestui-que* trusts. Under these circumstances a Royal Commission was issued in the autumn of 1878 to the Duke of Northumberland and the six following gentlemen—Canon Gregory, the Rev. William Rogers, Mr. Farrer Herschell, Q.C., Mr. George Cubitt, Mr. Albert Pell, and Mr. Henry Hucks Gibbs—to inquire into the condition of these Parochial Charities, and to make such recommendations as their inquiries might suggest for their future regulation and administration and for the due appropriation of the funds. The intent of the Government in appointing such a Commission was doubtless to secure moderate and well-considered recommendations; and the names of the Commissioners, representing as they do different sections of political feeling, are a guarantee that, while no violent changes would be proposed and no funds belonging to these charities unduly diverted from their original objects, none would be left either to accumulate needlessly or to be spent on unworthy objects. The Report which has just been printed appears to us to justify this expectation, and will, we think, on the one hand, go far to satisfy those who have been urgent in demanding the inquiry; and, on the other, to calm the fears of those who apprehended that they would be deprived of their ancient and just rights in funds which had been given for their benefit or committed to their care.

That some action was urgently required will be manifest by a glance at some of the facts brought out in the evidence collected by the Commission, alike as to the condition of the recipients of the charities, the present amount of the funds, and the uses to which they have been put. It is very much to the credit of the authorities in the several parishes that, in spite of their not unnatural fears of the tendency of such an inquiry, so little reluctance has been shown by them to give full information to the Commissioners on all these points.

The area of the City is but one square mile, the number of civil parishes therein contained is 109 (reduced by union for ecclesiastical purposes to 60), and the population at the time of the last decennial census was 75,000, against 112,000 according to the census of 1861. The annual income held by these 109 parishes collectively was in 1876 no less than 104,904*l.* 13*s.* 4*d.*, given or bequeathed for the most part for eleemosynary and ecclesiastical purposes, but in part also acquired, whether by gift or by purchase out of the rates, for the general purposes of the parishes. Of this sum, however, 17,700*l.* is now administered under schemes approved by the Court of Chancery; and other schemes, involving about 6,200*l.* a year, are still under the consideration of the Court; so that the net annual income coming under the view of the Commission may be taken to be about 81,000*l.*, besides any increment which during the four years since 1876 may have accrued from the augmentation in the value of property in the City. The probability of such increment may be gathered from such instances as that of St. Augustine's, where a house let for 20*l.* in 1868 now produces 250*l.*; that of Allhallows, Lombard Street, where houses rented in 1860 for 482*l.* now let for 1,200*l.*; and that of St. Peter le Poor, where the rent of certain houses belonging to the parish was raised in 1873 from 60*l.* to 1,450*l.*

While the money value of the charity estates has been continually increasing, such of the objects to which the funds were devoted as had not wholly passed away were daily diminishing in an inverse ratio. Not to speak of gifts for "superstitious uses," which had either been seized by the Crown or transferred to other ecclesiastical or eleemosynary purposes, there were many instances in which the original and praiseworthy purpose of the donor had been forgotten or neglected and the money otherwise employed. Thus daily prayers for which funds had been given ceased to be said in some churches. Lectures ceased to be given in others. Bow Bell was, by the will of one Downing, who devised a house for its maintenance, to be rung at nine every night, and now, to the loss of many whose title to be called Cockneys may therefore seriously be called in question, is rung no longer. Some parishes which are possessed of funds destined for church purposes have no church of their own to which to apply them; while other parishes have churches, but no funds with which to maintain them. Some have abundant money to relieve the wants of the poor, but have no poor to relieve. Some have neither poor nor rich, and indeed have no householders, properly so called. Thus the Bank of England, like another Dragon of Wantley, has swallowed up the church and the whole of the parish most prophetically called St. Christopher le *Stocks*, and has devoured also no small part of the parish of St. Bartholomew-by-the-Exchange, which only saved its church from the same fate by transporting it stone by stone into Fore Street. The Post Office, again, represents three-quarters of the parish of St. Anne and St. Agnes; and the Cannon Street Railway Station is left to account for a large part of Allhallows-the-Great, from which parish in 1878 twenty-seven families were being expelled by the destruction of their houses for City improvements. The churchwarden of St. Andrew Hubbard, searching for a poor man like Diogenes for an honest one, "could not find a single poor person who had any possible claim on the parish"; while the more fortunate rector of St. Vedast Foster says, "There is one poor person in the parish." St. Peter le Poor belies its name, for "there are very few poor within its boundaries." Where, as in this last case, the objects of charity have not wholly ceased from among us, the income is frequently far more than sufficient. St. Anne and St. Agnes has a balance "which wants to be dealt with." Another parish, having more than it needs for Church purposes, is able to spend it and borrow more for a very profitable building speculation. "The consequence," says one witness, "of having large sums of money without proper recipients, is that the parish estate is looked on as a milch-cow." St. Mary Bothaw has a bequest of 3*l.* a year for the poor; but there are no poor, so the parish cannot distribute it.

The clergy and parish officials charged with the administration of these charitable funds appear to have done their best to distribute them fairly, when the circumstances of the parish gave them opportunities of doing so within its borders—applying to Church purposes that which either by direction of the donor or by fair construction could be so applied, and to the relief of the poor what was plainly eleemosynary in its origin; often in the latter case interpreting their duty largely, and seeking beyond the bounds of the parish those poor who had formerly belonged to it, and even, in a few instances, the descendants of such as had so belonged. The Rector of Allhallows the Less speaks with pride of the discovery of "three extra objects in Christmas 1878—old men who had been working in the parish for a great number of years, and are now unable to do anything." It cannot be said, however, that all their almsgiving was quite justifiable, or even well calculated to benefit its objects. Sometimes, through want of knowledge, and in defiance of political economy, surplus funds were applied to the payment of poor rates, thus (at least under the altered condition of the Poor-law) benefiting the rich and not the poor. Sometimes this mistake was due to the original sin of the donors, whose bounty had taken the form of doles; concerning which doles

there is a very general agreement in the evidence that they are at best useless and tend to pauperize the recipients; and one vestry clerk euphemistically says of them that "they do not tend to promote the sobriety of the district."

Under the circumstances to which we have above referred, it is no wonder if the parishes have been sometimes hard put to it to find an outlet for their funds, and have occasionally been too ready to act on the maxim "Charity begins at home." The direction which this abuse has taken has been not unnaturally towards the increase of the creature comforts of the vestry or the parishioners. Thus the vestry of St. Anne and St. Agnes enjoy "a glass of wine round," and an Easter dinner. The vestry of St. Botolph's, Aldersgate, expend 72*l.* 18*s.* 6*d.* on "visiting the tombs," a phrase which a witness explains by saying, "It simply means a dinner given by the churchwardens out of the funds voted by the vestry." In the parish of St. Martin Orgar all the parishioners who chose to attend were made happy by a Greenwich dinner at a cost of some 72*l.* It is fair to add that in some cases the entertainments are paid for out of moneys claimed by the parishes as their own property, and not as charity funds, while in other cases money was especially bequeathed for a feast to promote good will and reconciliation. But the vestry do not appear to confine themselves to the precise amount of 5*s.*, which the donor had left for what he calls "a love feast," with the same conscientiousness which they exhibit in the case of the bequest of 1*l.* 6*s.* 8*d.* dedicated "to the maintenance of some godly, virtuous, and well-disposed scholar at the University of Oxford or Cambridge." The 1*l.* 6*s.* 8*d.* is, we presume, still enjoyed by the scholar, but a dinner at Richmond costing 60*l.* represents for the too fortunate legatees the modest 5*s.* of the testator. And it has not been their own comfort only which some parishes have sought, but also the discomfort of others; as witness the surprising contributions of 25*l.* and 50*l.* respectively by the parishes of St. Vedast Foster and St. Michael le Querne, in aid of the efforts of the Church Association for the prosecution of their rector.

This condition of things was unsatisfactory enough; and accordingly some of the parishes submitted schemes to the Charity Commissioners. Some of these schemes have been considered and approved, while some, though long ago submitted, still remain for one reason or another untouched; and of the schemes approved some no longer meet the necessities of the case. Thus a sum which has already reached 1,344*l.*, and is still accumulating, was appropriated, under a scheme sanctioned by Sir J. Romilly, to provide a cemetery for the parish of St. Michael, Crooked Lane; but, as hardly any one lives in the parish, few are likely to die there, and none to need a cemetery. Several of the witnesses seem to have given much attention to plans for the better distribution of the charities. Thus a witness, speaking on behalf of St. Augustine, says:—

> We considered it would be more satisfactory to wait for some general scheme rather than apply for a scheme for our individual charities. In the furtherance of a general scheme we should be very glad to pay over such sums of money as we fairly could not find employment for in the parish. A strict line should be drawn between (1) the large bequests for strictly ecclesiastical purposes, *i.e.* for the maintenance and upholding of the fabric of the churches and the maintenance of divine worship; and (2) the purely eleemosynary gifts.

And a witness from St. Christopher le Stocks, who attaches more importance to local administration, says:—

> There would be no difficulty in applying these charities if we were allowed to apply them to those who work in the parish, who are a very large class, among whom would be many proper recipients.
>
> The foundation of any satisfactory redistribution must be local administration. It was argued at a meeting of churchwardens and trustees that what was required was not so much a confiscation of our property, but largely increased facilities for making use of it; and a speedy way of getting authority to make use of it.

It will be seen that the Commissioners have reconciled both these views. Their Report says:—

> It would be easy to multiply examples of the defects and anomalies apparent in the present administration of the City Parochial Charities, but we believe that we have given enough to establish the following facts; namely,
>
> That this administration is not calculated to be productive of the full benefits which ought to accrue to the class for whose advantage these charities were originally founded.
>
> That the relation between the administrating bodies and that class is so completely altered, that neither in the strictly literal nor the strictly legal sense can the intentions of the founders generally be carried out.
>
> That in practice the administrators are compelled to act on the *cy près* principle according to the will or caprice of the local managing bodies.
>
> That it is practically impossible to effect a combination of these Charities under the existing system.

And they proceed to recommend that an Executive Commission be appointed, paid out of the funds of these charities, and consisting of three persons, of whom one is to be a member of the staff of the Charity Commissioners. The duties of this Commission would be (1st) to inquire into the origin and administration of each charity, and to examine the accounts of the trustees for seven years past; (2nd) to classify the charities under two heads—namely, Eleemosynary and Ecclesiastical. It is proposed to include in the Ecclesiastical class not only such funds as by the terms of the bequests went to the maintenance of the fabric, the services, or the clergy, but also such as have been for many years so used by the parish. It is on this point that a difference of opinion was manifested by some members of the Commission, to whose memoranda on the subject we will presently advert. The Report continues:—

> In those parishes where the income of any estate or estates has been applied for the maintenance of the fabric or support of the church, as well as for the relief of the poor, and there is no evidence that such application is inconsistent with the intention of the donors, the Executive Commission would be instructed to make an equitable division of the proceeds of such estates, the one portion to be applicable to ecclesiastical, the other to eleemosynary purposes.

And it is suggested that out of the mass of ecclesiastical funds the Commission should allot to each parish whose endowments bear that character such portion as it m..y deem necessary. This being deducted, the trustees are to be required to hand over the surplus to the Ecclesiastical Commissioners, to be by them applied in aid of the erection and repair of churches, and of the spiritual needs of the poorer parishes within the metropolitan area, devoting to the increase of poorer benefices within the same area the funds derived from bequests for lectures, &c. As to the funds classed as eleemosynary, the trustees in the several parishes are to retain such an amount for the purposes of their trusts as the Executive Commission may authorize, and are to hand over the surplus to a Board to be constituted for the purpose, to which Board will also pass the whole estate of any trust where it can be shown that its objects no longer exist.

The proposed constitution of the Board is as follows:—

> Fifteen members chosen by ballot from the representatives of the City parishes, such representatives being elected annually in the proportion of one to each parish by the electors on the parliamentary registry.
>
> Two members of the Common Council.
>
> Two of the Metropolitan Asylums Board.
>
> Two of the Metropolitan Board of Works.
>
> With four co-optative members, together with a paid chairman and secretary, to be appointed by the Secretary of State for the Home Department.

On this Board would devolve the duty of forming schemes for the application of the funds dedicated to strictly charitable or philanthropical purposes arising from the above sources and from the suppression of obsolete charities; and the Report indicates certain examples of objects to which the funds might be applied in the discretion of the Board, but subject to the disapproval, within a fixed time, of the Charity Commissioners, to whom all schemes as well as the accounts of the Board are to be submitted. The intervention of the Charity Commission does not commend itself to Mr. Herschell, who would leave the Board unfettered; but we incline to think that it would be unwise to leave the disposal of these funds to the sole and unchecked discretion of a popular Board; and we do not see any force in the objection which the same Commissioner urges, with the support of Mr. Rogers and Mr. Pell, to the use of the increment of any particular trust for kindred purposes to those on which the original funds of the trust have been for a long time employed. If, for example, any City parish possesses an estate given or hitherto used for church purposes, and either the church has been taken down, or the value of the estate has enormously increased, there seems to us to be no valid reason why the surplus funds so arising should not be employed for church purposes in other parishes.

Altogether we must consider the recommendations of the Commission to be of a very satisfactory and practical character, and such as can scarcely fail to command the approval of the incoming Government.

THE FLOATING DEBT.

THE impending change of Ministry has given rise to a general expectation that the Floating Debt will be speedily and largely reduced. The expectation is natural. It has been the policy of all Liberal Governments for a long time, or indeed, we should rather say, of all Administrations preceding the present, to keep the Floating Debt at a low figure. For example, we have to go back to the time of the Crimean war and the Indian Mutiny to find it above 20 millions. In 1856 it slightly exceeded 28 millions; but strenuous efforts were then made to bring it within more manageable proportions, and in 1859 it was got down to a little more than 18¼ millions. In 1866 it only slightly exceeded 8 millions; and in 1874, when Mr. Gladstone's Administration came to an end, it was under 4½ millions. Thus, between the close of the Crimean war and the defeat of the last Liberal Cabinet, nearly six-sevenths of the Floating Debt were paid off or funded. But with Lord Beaconsfield's Ministry a change set in, and at the termination of the financial year which has just ended this part of the debt had again risen to over 30¾ millions, or more than 2¼ millions higher than it was at the close of the Crimean war. During the six years of the present Administration the Funded Debt has been reduced 26 millions, but the increase of the Floating Debt was somewhat greater, and thus the net result is that the liabilities of the country have been increased during the period by a quarter of a million. It is quite true, as the Chancellor of the Exchequer pointed out in his last Budget statement, that a large part of the Floating Debt is covered by excellent security, and in reality adds nothing to the taxpayer's burdens. The Suez Canal Bonds, for instance, not only represent a very valuable property, but the interest on them is paid by the Egyptian Government. Again, the loan of two millions to India is repayable at very short dates. And the advances to local authorities are well secured, while the interest is covered by that which the local authorities pay. Sir S. Northcote is therefore justified in saying that the debt which imposes a burden upon the taxpayer has been reduced during his administration by 18 millions. But we are not now concerned with the reduction of the general debt. Our object is

to trace the growth of the Floating Debt, which, whether recoverable from other quarters or not, is in the first place a portion of the liabilities of the United Kingdom. According to the Chancellor of the Exchequer's last Budget statement, the Floating Debt was last month composed as follows:—5,100,000*l.* Exchequer Bonds, 5,431,000*l.* Treasury Bills, 3,800,000*l.* Suez Canal Bonds, 8,360,000*l.* Local Loan Bonds, and 8,100,000*l.* Supply Bonds, making altogether 30,791,000*l.* The last item mentioned in this list, the 8 millions of Supply Bonds, represents the accumulated deficits of the last few years, and Sir Stafford Northcote himself found it necessary to provide for paying off the larger part of these. He proposed, accordingly, by means of Terminable Annuities, to clear off 6 millions in five years, thus leaving only 2 millions of the accumulated deficits to be dealt with. We showed last week, when commenting upon the yield of the revenue in the past financial year, that the current year will probably give a surplus of a million or two, and, in addition, the South African colonies are expected to contribute something to the cost of the Zulu war. Evidently Sir S. Northcote calculated upon paying out of these two sources within the next twelve months the two millions of accumulated deficits which he left uncovered. Let us assume that his intention in this respect will be carried out by his successor. We then have as the amount of the Floating Debt to be dealt with by the new Chancellor of the Exchequer about 22¾ millions. This is a considerably larger amount than, since the suppression of the Indian Mutiny, has been thought compatible with good finance by Liberal Chancellors of the Exchequer.

We have on former occasions shown the objections to a very large Floating Debt, and we need not go over the same ground again; the more especially as Sir S. Northcote himself admits the justice of such objections, though he endeavours to turn their point by observing that little more than half his Floating Debt is in the hands of the public. Unquestionably this diminishes their force. The National Debt Commissioners are not likely to throw his Bills upon the Chancellor's hands at an inconvenient time. But it is to be borne in mind that, to the extent to which the Commissioners invest in Treasury Bills and Exchequer Bonds, to the same extent they lessen their purchases of Consols and Terminable Annuities. However, we need not push this point, but may rest content with Sir S. Northcote's express admission that a large Floating Debt in the hands of the public would be inconvenient, and with his practical admission, by the creation of Terminable Annuities, that its amount last month was excessive. The interesting question just now is, what will the next Chancellor of the Exchequer do? We have shown above what has been the practice of previous Liberal Ministers, and sound theory is undoubtedly in favour of that practice. Moreover, for the next few years there is likely to be a motive for keeping down the Floating Debt which Sir S. Northcote has not had. He succeeded to office just when the period of prosperity "by leaps and bounds" had come to a close, and since then year after year the depression went on increasing. In consequence, the value of money tended downwards, and, with certain exceptions, the Chancellor of the Exchequer was able to borrow on very moderate terms. Now the tide has apparently again turned, and we may hope that a period of fresh prosperity has set in, during which the value of money will tend upwards. The Chancellor of the Exchequer will therefore not be able to borrow on such favourable terms, and occasionally may even have to pay high rates. This will be a check upon borrowing; and at the same time the return of prosperity, by increasing the revenue, will afford less excuse for further resorts to credit. We may conclude, therefore, that a reduction of the Floating Debt is probable. It remains only to inquire in what way it had best be effected.

To apply to this purpose the surpluses which improved trade and increased employment may be expected to yield would be a slow process, and would leave the Government exposed to all the inconveniences attending constant renewals of bills in a rising market. There remains the alternative either of the issue of Consols or the creation of fresh Terminable Annuities. But it is hardly to be supposed that the new Government will add to the permanent debt of the country by the issue of Consols. All parties are at length awaking to the duty of reducing the debt in times of peace and prosperity; and to increase it would be a retrograde movement for which there is no justification. The obvious means of attaining the object in view would be to follow the example set by Sir S. Northcote last month, which itself followed the precedent of 1864, when 5 millions of Floating Debt were cancelled, and to convert another portion into Terminable Annuities. Of course there is the difficulty that there is no public market for Terminable Annuities. Whether it be that the investing public do not like a stock which expires after a term of years, or that the conditions offered are not considered sufficiently favourable, it is certain that in the open market Terminable Annuities do not sell. Consequently they can be created only to the amount which the National Debt Commissioners have funds to absorb. But there seems no reason to apprehend a serious obstacle in this direction. The mere reduction of the Floating Debt, however, is of much less importance than the stoppage of its growth. In the statement given above of the composition of the Floating Debt we saw that over 8¼ millions are Local Loan Bonds—that is to say, have been incurred in order to lend money to local authorities. As long as this system continues, the Floating Debt must go on growing; and how to stop it is the first point to which a new Chancellor of the Exchequer should give his attention. Sir S. Northcote attempted but failed to do this, and it must be admitted to be by no means an easy task. The local authorities are required by law to effect a great many improvements which involve them in considerable expense, and they have now grown accustomed to obtain the money on easy t[erms] from the Treasury. To refuse to lend further would obviously provoke much discontent, which might find vent in ways anything but agreeable to party leaders. But risks of this kind have to be run by statesmen who undertake the responsibility of government. It is not necessary absolutely to stop lending. There are some public works so desirable that the Government are bound to insist upon their execution, and yet the local authorities may be too poor to bear the charge which they would have to incur if they borrowed in the open market. But loans should be restricted to cases where there is a plain necessity for them. It is ridiculous to lend to such a town as Birmingham, whose credit ought to be good enough to secure fair terms in the open market. If there is anything in the state of the law which prevents such a town from borrowing reasonable amounts for useful purposes, the law ought to be reformed at once. But if the difficulty of borrowing arises from past extravagance, or from too great haste in making improvements, and consequently in incurring debt, there would be no harm in the town being made to feel the consequences. Nor is it only to great centres of industry like Birmingham that these remarks apply. Loans to local authorities should be exceptional, and should be made in each particular instance only on proof that the public interest requires it. In London, for example, the credit of the Metropolitan Board of Works is so good that it is able to borrow advantageously not only for itself, but also for the parish vestries. If this precedent were followed widely, the State need seldom intervene. Assuming that the County Government Boards to which the Liberal party is pledged are called into existence, they ought to stand in high credit, and ought to be able to lend profitably for themselves to the smaller rural districts, which at present are those that most need Treasury help. The real problem, then, involved in the reduction of the Floating Debt is not how best and most speedily to pay off a portion of it, but how to stop its future growth. And this, again, resolves itself into the question, how to get rid of the necessity for making advances to local authorities. Until this latter question is solved satisfactorily, the difficulty will continue to recur.

REVIEWS.

SCHÖMANN'S ANTIQUITIES OF GREECE.*

THE object of the translators in publishing this work in an English dress is to place in the hands of English scholars a book which may serve as a connecting link between a History of Greece like that of Grote and a Dictionary of Antiquities like that of Dr. William Smith, and which may therefore be used less as a work merely for reference than as a series of systematic treatises on integral parts of the subject. Thus the greater part of this, the first volume, of Schömann's work is occupied with the constitutional history of Athens and Sparta; the general characteristics of the Greek State and the forms through which it had passed, before we reach the period of a contemporary written history, being given in two earlier sections or parts. The value of such a work must depend almost wholly on the soundness of the conclusions or general views of the author on the chief questions with which he must deal in summary rather than in full detail. Practically he is discharging the office of the historian; but he is also giving judgment without placing the whole of his evidence before the reader. This must be so from the necessity of the case; but it is clear that the work will assume a very different form as it comes from the hands of a Mitford, a Thirlwall, or a Grote. Of the two States to the portraiture of which the larger portion of this volume is devoted, the more brilliant city, which has left its mark on all time, has a history as brief and rapidly shifting as it was splendid. During this short period it furnished lessons of political experience from which statesmen of every age have gained wisdom. It exhibited an astonishing growth in a constitution which secured the largest amount of freedom to the individual citizen and insured his highest culture by means of an education which drew out every part of his nature, and impelled him to make the greatest sacrifices for the sake of the State to which he owed a life of such many-sided activity and such exquisite refinement. This phase of short-lived splendour was followed by a war with a rival State which represented tendencies widely, if not radically, opposed to its own; a State which insisted on the complete isolation of the members of the Hellenic people, which set its face steadily against the Pan-Hellenic dreams of Perikles, and which rendered the growth of an Hellenic nation wholly impossible. This war tempted the Athenians to an abandonment of the policy in which alone, as Perikles had assured them, they would find safety; and the frightful catastrophe which was the direct consequence of their fault naturally weakened the con-

* *The Antiquities of Greece.* Translated from the German of G. F. Schömann. By E. G. Hardy, M.A., Head-Master of the Grammar School, Grantham, and J. S. Mann, M.A., Fellow of Trinity College, Oxford. *The State.* Rivingtons. 1880.

fidence of the people in their own political sagacity, and made them disposed to listen to advisers who proposed to point out to them the only practicable method of escape from their difficulties and their troubles. The result was the upsetting of the constitution the foundations of which had been laid by Solon, and of which the superstructure had been raised by Kleisthenes, Ephialtes, and Perikles himself. Now it is clear that the value of the lesson which the whole of this wonderful history teaches must be measured precisely by the degree in which our judgment of the several actors in it squares with the facts. If these facts cannot be given in detail, it becomes of the first importance to ascertain whether the change which led to the exaltation of the Four Hundred was good or bad, whether the oligarchic party or that of the people most desired the good of the country, and most consistently and steadily worked for it, and to which party the evils from which Athens suffered were chiefly to be ascribed.

We shall see presently how far Schömann's judgment on this question and on some others scarcely less important can be accepted with entire confidence; but we may say at once that the method of the work is thoroughly sound, and that the book ought to be both attractive and profitable to the student. The author set about his task with the purpose of imparting "a vivid understanding of classical antiquity" to readers who, "without having made any special investigation into the ancient world, nevertheless feel the need of making themselves better acquainted with its spirit and character." But he was aware that a general interest would be felt only in that portion of the subject which is concerned with the social, political, and religious life of the Greeks; and to this he has rightly confined himself. An introductory chapter on Homeric Greece, in which the evidence of the Iliad and Odyssey to the prehistoric condition of the country is not unduly strained, brings him to a survey of those shifting scenes in the political development of the country which preceded the historical Greece of Herodotus and Thucydides. Nor can it justly be said that the picture here drawn of Homeric society prejudges any questions which may be supposed to lie open with regard to the time when the Iliad and Odyssey, as they have come down to us, assumed their exact present shape. The poems themselves may be the work of one poet or of many; they may have been pieced or dovetailed together; but the pictures which they bring before us belong beyond doubt to a comparatively primitive state of things; and, when we find with regard to particular crimes, for instance, a stage of sentiment markedly opposed to that of the historical ages, we are at once driven to the conclusion that we are confronted with the earlier practice, and that in this practice we have an historical fact of real value. With questions belonging to still earlier times Schömann happily deals briefly and summarily. He does not care to hazard a conjecture as to the precise path by which the Hellenic tribes may have entered Greece, or to determine exactly what may be meant by the Pelasgian name, or what may have been the origin of the people to whom that name was applied. The task of explaining it from Greek roots is so unsatisfactory that he does not wonder at the temptation which has led some to seek its meaning in other languages. Among these, "as was to be expected, Sanskrit, the language of the mystic *Konx om pax*, has generally been chosen." But clearly the search must be given up as a hopeless one. There is no use in referring it to Pelops or Pelagon, "because the explanation of these names themselves is anything but certain"; and so we welcome with a certain feeling of thankfulness the undoubtedly judicious conclusion that

> the name of Pelasgi, having originally been the appellation of some one of the peoples who inhabited Greece in prehistoric times, was at a later period, after the Hellenic people had extended itself over the whole land, and their name had become the collective title of the race, employed as the most universal term for all the pre-Hellenic populations, without respect to their true ethnographical relationship; so that the Philistines or Phenicians may, at any rate, be assigned a place among them, while many tribes which are usually brought before our notice under special names of their own, and are commonly distinguished from the Pelasgi, such as Leleges, Caucones, and Thracians, are not on that account to be considered less Pelasgian than others who are expressly included under the name.

In the Iliad and Odyssey, and more particularly in the latter, Schömann finds reasons for limiting some statements of Thucydides in the introductory chapters of his history. The proposition that piracy was in the earlier ages regarded strictly as an honourable profession must, he holds, be taken with large qualifications. It was contradicted by Aristarchus, and in the Odyssey the father of the suitor Antinous is certainly said to have been nearly killed by the people of Ithaca for joining the Taphians in a plundering expedition against their friends the Thesprotians. The raids of pirates must therefore, it would seem, be directed against avowed enemies; but the modification seems, after all, to be slender enough. The words of Thucydides seem to apply strictly to the practice of the Dyak pirates at the time when Sir James Brooke first found his way to their haunts; and the license taken by plunderers in prehistoric Hellas may have been practically as large without violating the restrictions mentioned in the Odyssey. We approach a more debatable land when we turn to the changes which are supposed to have followed the Dorian emigration. With the author's general method we have no quarrel; but little seems to be gained by treating the evidence at our command as more solid or satisfactory than it really is. We can neither deny nor affirm that Aristodemos, Temenos, and Kresphontes obtained each the Peloponnesian territories of which they are said to have become the sovereigns; and when we are told that the date even of the last member of the dynasty of Temenos "cannot be fixed with certainty," we feel that in dealing with the dynasty generally we are moving among quagmires. Less than this we cannot say when Schömann comes to examine the changes in the Athenian constitution before the time of Solon. The Medontidæ, so called from Medon, the son of the last King Codrus, are said to have ruled as archons for life at Athens for more than three centuries. During the whole of this time there was practically no knowledge of writing in the country. "No adoption of it in the education of the young can be detected," the author tells us, "earlier than the sixth century," although he allows that some few instances of written composition may have existed as early as the eighth or ninth. When then we admit that for the whole period during which the Codridæ ruled at Athens no particulars can be given, except that at last the cruelty of Hippomenes led to his deposition and to the throwing open of the archonship annually to all Eupatrids, we can but hesitate to pledge ourselves to the correctness of so shadowy a narrative. It is strange perhaps that the first archon for life and the first annual archon should be called Medon and Creon respectively; but we are quite willing to allow that no great stress should be laid on coincidences of name, which in some instances certainly are accidental, and that the change from life archons to annual magistrates had proceeded from the efforts of the Eupatrids to secure a more general participation in the State authority.

We approach a subject of much greater importance when we deal with the reforms ascribed to Solon. Did he summarily release landowners from their mortgages, and did he debase the metallic currency? These are really the two questions to be answered. Schömann answers them in the affirmative; but we cannot say that we are at all convinced by his arguments. We have, it is true, anecdotes which tell us that, although Solon was above such evil-doing himself, there were among his friends some who, knowing what he was about to do, made capital for themselves by buying lands the price of which they did not pay until after the debasement of the standard. These anecdotes come to us from times separated from those of Solon by a series of many centuries; and Schömann allows that the facts may not have been precisely as Plutarch relates them. But the real point is, whether the changes introduced by Solon, momentous as they were, answered at all to what we understand as a debasement of the currency, and still more to what we should understand by a nullifying of mortgages. Undoubtedly the lower classes had, as Schömann says, been suffering under a heavy yoke; but what was this yoke, and what were the classes which were oppressed by it? They were, as he has already said, Thêtes, or serfs, whose properties (if ever they had any) had long since "fallen into the hands of the rich nobility" (p. 323). In other words, these Thêtes were no longer landed proprietors themselves, and they had no land to give in pledge. At best they were simply suffered to live upon it as Hektemorioi; and Schömann seems to think that, as such, they were placed under the almost impossible obligation of paying not one-sixth (as is generally supposed) but five-sixths of the produce to their lord. By the measure known as the Seisactheia Solon, he holds, "provided that for the future the person of the debtor should cease to be pledged"; but the fact that it could be pledged seems to be evidence that he was not the owner of property which he could offer as security for his debt. He adds that Solon himself "boasts, in fragments of his poems which are still extant, of having removed from the mortgaged plots of land the pillars that served to show that they were thus pledged, and of having insured a return to their fatherland of many who had either fled to foreign countries to escape serfage, or had actually been sold by their creditors." But these creditors could only have been the owners of the soil, for Schömann has himself asserted that the debtors had already lost their land (if they ever owned any), and that their persons were pledged and their bodies liable to be sold if they failed to furnish the amount of produce expected from them. Clearly the money-lenders (if there were any who lent money at all) must also have been the landed proprietors, for these would never have dreamt of suffering their own serfs to pledge their persons to a set of professional usurers who might at any moment deprive them of their property. But, in truth, there is nothing in the language of Solon which countenances the notion that he was dealing with anything of the nature of a modern mortgage. He speaks of a peasantry horribly oppressed, confined in chains, and constantly sold out of the country, and of boundaries which, being fixed in many parts, he had removed from the black earth; and he goes on to speak of having set free the soil itself, which had heretofore been itself enslaved, before he mentions that he had rescued large numbers from foreign bondage. It seems abundantly clear that Solon was dealing with the religious ownership of the land by Eupatrids, and with the outward signs of that ownership which were invested with an inviolable sacredness. It needed no small courage thus to make away with his neighbour's landmarks, and so to declare the serf a free man, who, if he owned no soil himself, was yet bound only to pay a certain amount of produce or money to the owners simply as a rent, this amount being no doubt very much smaller than that which had been squeezed out of him under the old system. In short, by this great measure Solon called into being for the first time a body of free labourers; but it can scarcely be said that Schömann's account of this momentous change is as vivid as he may have supposed it to have been.

The picture which our author draws of the decline and fall of the Athenian State we regard with not less misgiving. To the wonderful efforts made by the people after the catastrophe

at Syracuse he does full justice: but it seems scarcely fair to say that they "gave ear" to the counsels of those who "declared it was necessary to undertake a transformation of the democratic constitution that had hitherto existed into a more oligarchic or aristocratic system of government." The fact is that they were bullied into obedience by men who cheated them with what they knew to be a flat falsehood as to the intentions and wishes of the Persian King; and it is by no means easy to see why, as Schömann insists, we must concede that some share in bringing about the change is to be ascribed to the "sound sense" of the people, and that otherwise it would not have been carried out so easily. He is obliged to add that another part of the people—namely, the army at Samos—held fast to the democracy and did not trust to the promises of the oligarchs. Surely, if sound sense was exhibited anywhere, it was exhibited by these Athenians who deliberately declared that Athens had revolted from them. It is not a question of the merits or demerits of oligarchy. The usurpation of the Four Hundred brought nothing but disaster and calamity to Athens. The misery of the time was not redeemed by the faintest alleviation of the general wretchedness; and we cannot but feel a certain distrust in the guidance of a critic who thus fails to note some of the most important features of a memorable time. After all, this is but saying that the book is one about which the reader should carefully exercise his own judgment; and the reservation in no way detracts from the great value of the treatise as a whole. The work of the translators, we need only add, has been admirably done.

EPISODES OF ANGLO-INDIAN HISTORY.*

THIS book is written to supply a want—that of a popular book on the history of British India "calculated to engage the attention of the ordinary reader." The ordinary reader is credited, however, with a considerable previous knowledge of the subject if he is to pursue it with advantage in Mr. Adams's pages, which, as must be the case with all such compilations, bristle with the names of persons and places to a degree necessarily somewhat bewildering to any one not already familiar with the subject. In fact, to attempt to write a history of India in which "the many difficult problems connected with our position in that country and our relations towards its people have been left untouched" must obviously fail to explain a great deal that needs to be explained if the narrative is to be intelligible. The truth is that a short popular history of India is from the nature of the case impracticable. An epitome becomes a mere inventory of names and places; and the so-called short histories and manuals are mainly of use as books of reference to those who are already well acquainted with the subject. The only way of making a short account of British Indian history generally readable would be to limit it to some short epoch; then the subject might be adequately treated within a moderate space. Of this book, which is limited to the military history of India, it may be said that the connecting passages are made as succinct as the nature of the case permits; but the military events with which it is concerned are narrated in the purely conventional style. The main facts are given of such and such a battle having been fought, and in a general way the result. But how it was won, and in what essential respects it differs from other battles, are points left to the reader's imagination to supply. The British soldier is always heroic and invincible; a sepoy is always a sepoy; and there is nothing in the book to indicate that any change had come over the organization of the Indian army from the time of Clive to that of Lord Gough, or that the composition of the native armies opposed to us had undergone any development. Of course, when history is written in this uncritical fashion, all the old mistakes of former writers crop up again. Thus we are told that the army of Nazir Jung which advanced on Pondicherry in 1749 was "a formidable army, in truth, for it consisted of 300,000 men, one half of whom were cavalry, with 800 guns and 1,300 elephants." This account is purely mythical; 150,000 cavalry, even if they had ever been collected, could not have been kept together for a single day in that country. To speak of this rabble as an army at all is misleading, as well as the comparison between the strength of the so-called opposing forces. "The forces of the allies did not exceed 40,000 men." But forty thousand or even four thousand men would be just as good as forty million of such a rabble; in fact, as the event proved, a few hundreds of the right sort were sufficient to overthrow these "armies with almost ridiculous ease." The Indian princes had not then learned the secret of military organization.

When our author does venture upon a criticism of his own it is often inappropriate. Thus, speaking of the first indecisive day at Ferozeshuhur, Mr. Adams says:—"The British had suffered so severely that the prudent counsel—from a military point of view—to retire to Ferozepur was given by some experienced officers." As if on the battle-field, when two armies are struggling for mastery, there could be any other point of view than a military one from which to survey the position. In fact, however, so far from such counsel being prudent, retirement on that occasion would have been madness. A great many officers, whether experienced or otherwise, had lost their heads on that eventful night, and, as always happens in such cases, the course which appears to give the momentary chance of escape will be seized on, no matter how great the ultimate danger—else why do armies allow themselves to be cut to pieces by running away?—but if we had retreated from Ferozeshuhur we should very probably have lost India. There were no reserves to speak of, and the beaten army would never have reached them. Happily, there were a few men in the army, including the Governor-General, who had not lost their heads, and the course was adopted which alone offered a chance of safety—to attack again at daybreak. As always happens in these bloody battles, the enemy also had had quite enough fighting, and victory went to the side which had the last kick left in it. Speaking of the same army after Sobraon, Mr. Adams says:—"Two days later the whole British army, with camp followers, counted 100,000 men." So one might say of a rich nobleman, that his family, including his servants, numbered fifty children. In the description of the battle of Deig, fought by Lake's army against Holkar in 1805, we are told that "Fraser, the general in command in Lake's absence, was mortally wounded; but Colonel Monson succeeded to the command, and by his courage and coolness retrieved his impaired reputation." This is a specimen of the inept criticism which pervades the book. Monson was a man of conspicuous bravery, his reputation in which respect had never been impaired. What he lacked was decision of character when placed in independent command, a defect which unfortunately he showed signally on this occasion, stopping the advance of the army just as the victory was won, and allowing the enemy to get away without being punished. "How can one account," wrote Lord Lake to the Governor-General on this occasion, "for a man who is as brave as a lion losing his head entirely when any responsibility is placed on him?" When he comes to the Indian Mutiny, Mr. Adams follows Sir John Kaye implicitly, and naturally falls into a good many pitfalls. Thus he adopts unhesitatingly the account of Havelock's so-called "battles" in his first advance on Cawnpore. Havelock in his despatches described numerous battles as having been fought on this advance, and as no lists of casualties accompanied the reports, the view was accepted at the time. But when the returns came to hand it was found that no one had been either killed or wounded. In fact, no battles had been fought. The rebels on these occasions would not stay to oppose our advance, which was thus a mere armed demonstration, although there was plenty of hard fighting later on. Kaye in his description says of one of these demonstrations that "it was scarcely a battle, but it was a consummate victory; our Enfield rifles and our guns would not permit a conflict"; thus showing, under the haze of the words employed, a suspicion that he was talking nonsense. Mr. Adams quotes the account as if it were an appropriate description of what took place. Nevertheless, after all abatement made for these faults, Mr. Adams's book may be recommended as bringing together a record of all our Indian campaigns within the compass of a single volume.

It is very noticeable that those of our Indian wars which have been most stubbornly contested have also been the most decisive. The Mahratta war of 1803-4 is a case in point. Never were British troops exposed to so hot a fire as at Assaye, and not even at Waterloo did any regiment suffer so heavily as did the 74th on that day. In truth it afforded quite a new experience of Eastern warfare. In our previous wars we had not found the Mahrattas formidable foes. Indeed the famous Colonel Goddard marched right across India with a brigade of Bengal Sepoys which had not the support of a single British soldier. And in our wars with Mysore, in which the Mahrattas had acted as allies, they had been of but little use, and had not impressed us with their fighting power. Their organization under French officers, and the collection of the great artillery equipment of which in due course we relieved them, were effected afterwards, and in a very few years. Certainly neither the Governor-General nor his illustrious brother at all anticipated the hard fighting in store for the British forces. And it is remarkable that the troops opposed to Lake in Northern India fought much better at a later period of the campaign, as at Laswari and Deig—in fact after they had got rid of their European officers than they did at the beginning before Alighur and Delhi. It cannot be said that the battles fought by Lord Lake were ever really critical, but under a less determined man than General Wellesley the issue of Assaye might certainly have been different; and, if so, the course of Indian history would have taken a very different turn, although of course that might be said of what has happened at every point in our onward course. One result, however, of our hard fighting was that when the enemy gave in, they gave in completely. They, too, had had quite enough; it took many years for the Mahrattas to show head again. The conquest of the Sikhs was still more difficult and still more complete. Here, too, we altogether underestimated our opponents at the outset. It is a singular thing that, although our officers crossed and recrossed the Punjab during the first Afghan war, and had abundant opportunities of seeing the Sikh army, they all seemed to have formed a poor opinion of it. The detachments from the Sikh army which co-operated with us in the second advance on Cabul were thought to show no stomach for fighting. And probably it was in consequence of this that, although the coming struggle with the Sikhs was distinctly foreseen by the Indian Government, no adequate precautions were taken to meet it; the army was neither concentrated on the frontier nor supplied with proper magazines, and eventually their invasion of our territories took us by surprise. Then was fought the most indecisive and, excepting Sobraon, the most bloody battle we ever fought in

---

* *Episodes of Anglo-Indian History: a Series of Chapters from the Annals of British India, showing the Rise and Progress of our Indian Empire.* By W. Davenport Adams. London: Marlborough & Co.

India. By the end of the day the native troops had gone to pieces, as the phrase goes, and the greater part of the Europeans also were quite out of hand. But the enemy were still harder hit, and the Governor-General, like a true soldier, divined that the victory would rest with the side which showed the most tenacity; he got a remnant of his army together next morning, and with that made the decisive attack. Even then we only escaped by a lucky chance. Our ammunition was exhausted, and the men were worn out by their exertions, when a fresh Sikh army came up, only, as it happened, to retire. In this battle, as in the still more bloody one of Sobraon, the loss incurred, and the difficulty of carrying the enemy's position, were ascribed to the want of tactical ability shown by the Commander-in-Chief; but to the fact that the enemy was so severely punished by the stand-up mode of fighting adopted may be ascribed the unquestioning way in which the Sikhs, after one more struggle, accepted the position and their conquest, although of course many political conditions combined to conduce towards this result.

In our late war with Afghanistan we may note the same tendency to underrate the foe at starting. No one seems to have been aware of the enormous armament collected by Shere Ali at Cabul, and although the Afghans have nowhere made a good stand, still, had they turned their available means to proper use, our troops and resources might well have proved insufficient for the work they had to perform. Of course the obvious answer to this objection is that in war a great deal must be left to chance, and that it does not do to overvalue your enemy, especially in the East; which is quite true. The enemy may always be expected to blunder and to show want of nerve; and the boldest policy is usually the safest in war. Had we assaulted Sebastopol in September 1854, how many lives would have been saved in the long run! The speculation may also be suggested that it is because the Afghans have never yet been thoroughly punished in any action, that they are still so pugnaciously disposed. One such thrashing as we gave the Sikhs might bring them to terms. And, considering how small is the loss of life in action compared with that caused by disease, it may be matter for regret that the Afghans have never as yet given General Roberts and his gallant army the chance of trying the effect on them of a good stand-up fight.

HANDBOOK TO ST. PAUL'S CATHEDRAL.*

THIS is the fitting completion of Mr. Murray's *Handbook to the English Cathedrals*, of which the first instalment, including the Southern cathedrals, was published as long ago as 1861. The promise given at the outset, of supplying a series of works which might serve both as a history and as a guide on the spot, has been fully made good; and the whole of the existing cathedrals of England and Wales have been described and illustrated with a scientific accuracy and a refined appreciation which merit the highest praise. Truro is an apparent exception to this statement. But that which now serves as the cathedral of the revived Cornish diocese is a mere parish church, which is to be absorbed in the stately building about to rise from the designs of Mr. Pearson, the first stone of which is to be laid by the Prince of Wales, as Duke of Cornwall, on the 20th of next month. When built, the cathedral of St. Mary's, Truro, will not be unworthy to take rank, "for grace, for simplicity, for religiousness"—to quote the words of Bishop Benson—among the cathedrals of England; but at present the design exists only on paper. Of the four new sees created by Mr. Cross's Act, Southwell alone has a church which is quite up to the mark as a cathedral, though Newcastle approaches it. This series of handbooks may be therefore regarded as for the present closed. More than one similar handbook may be, and, we trust, is, in contemplation. Westminster Abbey imperatively demands a sister volume based, like this one, on the volume of "Memorials" compiled by its Dean, which, we believe, gave the first impulse to Dean Milman's enterprise. A series is also required illustrative of the minsters and chief monastic churches of England, in which the future cathedral of Southwell may appropriately occupy the first place. The names of such noble fanes as Beverley and Selby, Sherborne and Christchurch, Romsey and Tewkesbury, and others which will at once occur to our readers, will show that such volumes would hardly, if at all, yield to the Cathedral Handbooks in interest and attractiveness. This series finished, a third might appropriately include our principal ruined abbeys, such as Fountains and Rievaulx, Netley and Glastonbury, Buildwas and Wenlock. But we are perhaps looking too far ahead.

The volume before us is distinguished from its predecessors in authorship as well as subject. The other volumes of the series were the work of the late accomplished antiquary, Mr. Richard J. King, to whom we are indebted for several of the best of the English County Handbooks—especially of those excellent types of their class, the Handbooks to Devon and Cornwall. But even if Mr. King's premature death—an irreparable loss to archæology—had not necessitated a change of plan, the ground was already occupied both by Dean Milman and Mr. William Longman. It was therefore wisely decided that this handbook should not be a new work, but "an abridgment of the 'Annals,' retaining as far as possible the Dean's text unaltered."

* *Handbook to the Cathedrals of England.—St. Paul's.* With Illustrations. London: John Murray. 1879.

Dean Milman's materials have been recast, and brought down to the present time, with the addition of sufficient architectural details. Those of the present fabric are mainly derived from Mr. Longman's *History of the Three Cathedrals dedicated to St. Paul in London*, which we reviewed on its publication, and which was to a large extent compiled chiefly from the writings of Mr. Joseph Gwilt and of Sir Henry Ellis, with the assistance of the Cathedral surveyor, Mr. Penrose. The history of the Cathedral is traced from its foundation by Mellitus, the companion of St. Augustine, on a site already devoted to pagan worship, to its rebuilding, after its destruction by fire, by Bishop Maurice, Chaplain and Chancellor to William the Conqueror, and Bishop Richard de Belmeis, in the "novel transmarine style of building" introduced from Normandy. We read in succession of the addition of the choir and extended eastern limb—the site of the shrine of St. Erkenwald—by Roger the Black and his successors in the episcopate in the latter half of the thirteenth century; the demolition of its spire, the loftiest in the world, and its roof by lightning in 1561; the repair of the ruined fabric as "a national work"; its costly but ill-judged restoration by Inigo Jones, with the addition of the magnificent but most incongruous Corinthian portico at the west end, intended to put a stop to the desecration of the nave, or "Paul's walk," by providing a covered place for the mixed rabble who had been accustomed to make of its consecrated aisles a market, an exchange, and a place of assignation, and thus "eject from the church itself those whom it was impracticable to expel entirely from the precincts." Then follows the narrative of the foul desecration of the cathedral during the Civil Wars, when the body of the church became a cavalry stable and its aisles cavalry barracks, and the portico was let out for mean shops to sempstresses and hucksters, and the historical monuments were "left to the idle amusement of the rude soldiers." The extensive scheme of repair proposed after the Restoration by Sir Christopher Wren was frustrated by the Fire of London, which gave the great architect a plausible excuse for the destruction of all that remained of the old cathedral, and its rebuilding from the foundations on an entirely new plan. The history of the rebuilding, and the architectural description of the edifice, are preceded by a notice of the chief monuments that adorned the old edifice, the most notable of which were those of John of Gaunt and his wife Constance, and of John of Beauchamp, so signally misappropriated to "good Duke Humphrey," who thus became "the patron of dinnerless parasites," of which, as well as of the shrouded effigy of Dr. Donne, which mainly, and of the recumbent effigy of Sir Nicholas Bacon, Lord Chancellor Bacon's father, which partially escaped the conflagration of 1666, there are woodcuts. Dr. Donne's monument has lately been removed from the crypt and replaced in the upper church.

A considerable portion of the volume is occupied by a compendious notice of the modern monuments with which the naked walls and vacant recesses of the cathedral have been peopled; and certainly, whatever exception may justly be taken in too many instances to their design and execution, to the great improvement of the general effect of this still somewhat cold and uninspiring interior. Beginning with the statue of Howard the philanthropist, erected in 1796, in whose case "admiration of the highest Christian charity" "extorted the first triumph over the inveterate prejudice" against the admission of monumental sculpture into the cathedral, and those of Johnson (whose semi-nude figure too vividly recalls a burly fellowship-porter who, having just set down his load, is stripping for a wash), his friend Reynolds—to whom the vergers counsel all preachers, new to the pulpit, to direct their discourses if they wish to be heard—and Sir William Jones, which occupy the four most conspicuous positions under the dome—the Handbook passes in review the more interesting of these "vast masses of marble," exhibiting "Fames and Victories and all kinds of unmeaning allegories, gallant men fighting and dying in every conceivable or hardly conceivable attitude," which in the course of the last eighty years "have risen on every side, on every wall, under every arch." The roll of naval and military heroes, who form the majority of the series, is not inappropriately broken by memorials of Middleton, the first, and Heber, the most celebrated, of our Indian bishops, as well as of Bishop Blomfield (by G. Richmond), the solitary Bishop of London commemorated in his own cathedral, and Dean Milman, of whose altar tomb, with a recumbent effigy of Williamson, there is a woodcut. Of his successor in the decanal stall, Dean Mansel, the consummate metaphysician and profound logician, the only memorial—hardly adequate to his merits—is a painted window by Hardman, in the Morning Chapel, which also contains a mosaic by Salviati to the memory of Archdeacon Hale, whose name was so long and so intimately connected with this cathedral. The later additions to this monumental sculpture gallery include the two Sir Charles Napiers, Sir Henry Lawrence, Hallam, Turner, Marochetti's huge black marble portal in the north aisle—mistaken by some for a short way of exit for hungry visitors to the bun-shop opposite—bearing the name of Lord Melbourne and his diplomatist brother; and the series closes with Mr. Stevens's long-looked-for monument to the Duke of Wellington, the latest, and by far the noblest, of the sepulchral memorials with which St. Paul's is decorated or encumbered, of which we had the opportunity of giving a critical description shortly after its completion. A woodcut indicates the general arrangement and motive of this very striking work, and shows how much the composition has suffered by the loss of the equestrian statue which the sculptor intended should sur-

mount the whole—sacrificed, it is said, to a poor jest of Dean Milman's, about the "great Duke riding into the Cathedral atop of his own monument." Happily it is not too late to add this feature, so essential to the completeness of the design, to which we are somewhat surprised to observe no reference in the letterpress. We may pass from the cenotaph to the tomb of Wellington, a sarcophagus of Cornish porphyry—"wrought in the simplest and severest style, unadorned, and, because unadorned, more grand and impressive"—in the crypt, eastward of the one which, designed and executed by Torrigiano for Cardinal Wolsey, and left lying neglected for centuries in the Tomb House at Windsor, now encases the coffin of England's great naval deliverer, Lord Nelson.

This crypt, forming a second and "under" church—not truly subterranean, as, from the elevation of the main floor, it is entirely above ground—corresponding in all its parts and arrangements with the upper church, has been of late years rescued from the neglect to which it had been doomed, and brought into vital connexion with the religious life of the cathedral. Walls have been thrown down, encumbering partitions removed, windows have been opened and glased, and—the most important alteration of all—an altar has been placed at the east end, appropriate fittings have risen around it, a tesselated pavement has been laid down, and the once dark, dreary, and useless vault has been converted into a chapel, and that not for show but for regular use. However we may rejoice at such an employment of the crypt, it certainly never entered into the calculations of the great architect of St. Paul's, who left its interior entirely devoid of the slightest approach to ornament, wearing "the appearance of a rock-hewn cave," devoted to the purposes of interment. Wren himself lies buried under a black marble slab at the east end of the south aisle, while "at his feet repose a long line of the artists who have done honour to England," from Reynolds, West, and Lawrence down to Turner, who lies, according to his dying request, as near as possible to Sir Joshua Reynolds, but not "as, in one of his fits of ill humour with the world, he had willed," in his "Carthage"—now one of the chief ornaments of the National Gallery—as a shroud. The great sculptors, Flaxman, Chantry, Westmacott, are elsewhere; but the sister art of architecture has some of her sons sleeping by the side of her great English representative. The crypt contains the graves of Mylne, the builder of the former Blackfriars Bridge, whose graceful arches and Ionic columned piers have not yet quite passed out of memory; and of "the skilful disciple, the almost worshipper of Wren, long the faithful custodian of Wren's works and of Wren's fame, Charles Robert Cockerell." One of the illustrations of the Handbook represents the Crypt Chapel, with its simple but appropriate fittings. Another woodcut, copied from Hollar, depicts the crypt of the former cathedral, used as the parish church of St. Faith, destroyed in the Fire of 1666, certainly not to the advantage of its modern successor. With all our admiration for Wren's architectural genius, we confess that the contrast of the clustered columns, the long-drawn groined vault, the carved bosses, and moulded capitals and bases with the almost savage nakedness of Wren's crypt is a painful one. It must, however, be remembered that the earlier structure was constructed for use as a parish church, while Wren's crypt was, as we have said, simply a basement story not intended for the public eye.

The just admiration entertained by Dean Milman for Wren and his works, especially for the cathedral over which for nearly nineteen years he presided, together with his strong predilection for Classical over Gothic architecture, blinded him to the real merits of the vast edifice on the ruins of which Wren's structure rose. Judging it simply from Hollar's plates, devoid as they are of all artistic feeling and full of evident inaccuracies, executed after the conflagration of the spire and roofs had deprived the cathedral of some of its most striking features, and the restoration by Inigo Jones—the first example of cathedral restoration in England, and of evil omen for subsequent works of the same nature—had drawn a smooth classical skin over the stern ruggedness of the vast Norman nave, and, with utter disregard to the original design, had refashioned the whole exterior "as suited his own notions of proportion and symmetry," Dean Milman pronounces Old St. Paul's "a gloomy, ponderous pile—with disproportioned aisles and transepts, and a low, square, somewhat clumsy tower," with "nothing to distinguish it" beyond its "vast size."—which "of all England's more glorious cathedrals could have been best spared." No verdict could be more unjust. Instead of being forced to "bow its head before the cathedrals of many of our provincial cities," Old St. Paul's must have stood as supereminent among them for architectural interest and varied beauty of design as for dimensions. Had Dean Milman enjoyed the advantage of seeing Mr. Edmund Ferrey's admirable restoration of Old St. Paul's—reduced copies of which are to be found in Mr. Longman's book—with all his appreciation of the "splendour and beauty of the proportions" of the new cathedral, he would have more adequately realized the immense and irreparable loss which mediæval architecture sustained in the destruction of its predecessor. With its twelve-bayed nave and twelve-bayed choir—the former a stately example of Norman, akin to Ely and Peterborough, and with the advantage over them of having a groined roof—the latter of the same date and style as the matchless Angel choir of Lincoln, and rivalling it in delicacy of design as it surpassed it in height, only eighteen inches less than Westminster Abbey; its five-bayed transepts reaching to the unexampled length of 340 feet, only ten feet short of the whole length of Chester Cathedral, and exceeding that of Hereford by fifteen feet; its enormously lofty and, even after the loss of its leaden steeple, majestic tower, with its graceful flying buttresses; its gorgeous Catherine-wheel window, nearly forty feet in diameter in the east front (surely this cannot be the "rose window" styled by the Dean "poor and insignificant"); its two-storied cloister (a singular arrangement reproduced at a later time in the still existing cloisters attached to St. Stephen's Chapel at Westminster), interesting fragments of which, as well as of the lofty octagonal Chapter House which stood embosomed in its graceful arcades, have recently rewarded Mr. Penrose's investigations—the effect of Old St. Paul's, both without and within, must have been one of overpowering magnificence. But "for the grace, which absolutely fascinates the eye," of the matchless exterior of the present cathedral, we should find it very difficult to pardon Wren for the remorseless decision with which he blew up and battered down the scorched walls and pillars to which the "obstinate piety" of Sancroft, then Dean, still clung. The fact that "a temporary choir had been hastily put up at the west end" proves that the nave at least had preserved its roof and was not beyond repair, and it is more than probable that the whole cathedral might have been restored, if the great architect had been so disposed. But he wanted a clear field for carrying out his grand idea, conceived long before the Fire, of a "vast auditory in the centre of the church, rising into a rotundo bearing a cupola, and then ending in a lantern," the gradual development of which may be traced in the All Souls' drawings; and we can hardly be surprised at his pronouncing the repairs of the half-calcined ruins hopeless, and "clearing away every vestige of the ancient fabric," that he might "build a new one worthy of the nation and of the City—the Christian nation, the Christian city."

The suggestion which has been thrown out that Wren's first design for St. Paul's should be erected as the cathedral of the new see of Liverpool gives an additional temporary interest to the woodcuts of the northern elevation and of the ground-plan. The exterior strikes us as decidedly heavy. The cupola certainly wants "the majestic, yet airy swelling"—to adopt Dean Milman's felicitous description—of the present dome; and the mode in which it rises through the roof, as Mr. Fergusson has remarked, detaches it still more from the main body of the church than in the present edifice, and injures the unity of the composition. The somewhat *mesquin* single cupola covering the western vestibule—there is no proper nave—is a poor substitute for the lovely campaniles, so exquisitely proportioned to the façade, and, in their broken outlines and contrasted curves, forming such a perfect foil to the calm majesty of the central dome, which grace the present west front; while the huge windows which occur at intervals, big enough for a loaded stage-waggon to drive through, are certainly very ugly features. The whole is weighed down by a cumbrous attic running round the building above the principal order. As far as the exterior is concerned, we may fairly congratulate ourselves that the opposition of those in authority—whether of the Duke of York, according to Spence's somewhat apocryphal anecdote, or, as seems more probable, of the bishops and clergy on the Commission, who thought the design not enough of a cathedral fashion, and were startled by the novelty of "a quire designed circular" and the absence of "aisles or naves"—proved insurmountable, and that Wren was compelled (the story goes that he did it with tears) to lay aside his first design and proceed to the conception of another.

It seems that in another important respect Wren was overruled by the Commission. The close screen which long divided the choir from the dome area is proved, by the substructure in the crypt, to have formed no part of his original plan, in which the organ found a place under one of the side arches of the choir, where, indeed, it will be remembered, it stood temporarily after its dethronement from the screen. We have lately seen a return to Wren's original intentions in the partial removal and lowering of the Commissioners' "heavy, clumsy, misplaced iron fence" which so long "compressed the cathedral in its gloomy gaol," hiding its proportions from all but "those who were admitted within the gates, usually inexorably closed." The words of the ill-treated, maligned, thwarted architect descending with sorrow to his grave, as Pope records in a "sad line" given by Dean Milman, show Wren's conviction that the judgment of posterity would be with him. "As for the iron fence, it was wrested from me, and the doing it carried on in a way that I may venture to say will be condemned."

On the various schemes suggested for the decoration of the interior of St. Paul's the author of the new matter of the Handbook cautiously forbears to enter. After referring to the mosaics already executed by Salviati from Mr. Watts's designs in the spandrels of the dome arches, and the unfortunate painted windows of the apse, carried out in defiance of all true principles of their art from Schnorr's designs, he continues (p. 95, note):—

> Much doubt has, however, been expressed as to the effect of introducing painted glass to any considerable extent into St. Paul's, and until some consistent general scheme of decoration has been adopted, it seems scarcely desirable to give any detailed description of particular experimental improvements.

It ought to be mentioned that the history and description of the edifice are followed, as in the other volumes of the series, by a history of the See and short biographical sketches of the Bishops, with the addition of memoirs of a few of the more eminent Deans. This

appendix, being almost entirely derived from Dean Milman's larger work, is naturally of high excellence. The additions necessary to bring it down to the present time, including the life of the Dean himself, are quite worthy of their position.

A DREAMER.*

THE hero of this story, Philip Temple, starts with being "the anxiety, the bugbear, the volcano," of his family, and ends with marrying the heroine and writing M.P. after his name. His progress is by no means an easy one, for not only does he in the course of the story get engaged to another woman, but the heroine also gets engaged to another man. In such embarrassments are they involved by about the middle of the second volume, that he proposes to her that they shall both at the same time destroy themselves. "That they might lose their identity in the awful step into another world did not occur to him." Griselda, the heroine, was, fortunately, a little more prudent, and scarcely liked this leap in the dark. "To her, who knew nothing about the next world, the idea of death did not wholly obliterate the idea of parting." Her lover points out to her that they will "not be the first who have chosen hell to be together." "Griselda paled. 'Why must we choose hell?' she asked faintly." Happily there did not seem to be any very satisfactory answer to this question, and so they decided—elected, they would no doubt have said—to go on living. The reader will perceive from this hasty sketch of the plot that the story is one full of striking contrasts. It is not one that is very easy to follow or to describe, for it is full of complications. Moreover it is so very dull that it is almost impossible to summon up sufficient patience to master the plot. We have not only Philip Temple, the hero, but his rival, Ralph Lindsay, who dies of a fever; his future wife's brother, who commits forgery and dies in gaol; her father, who is a gambler and who seems to have been murdered; her uncle, who conceals a will and robs her of her inheritance, but dies penitent; her cousin and rival, who hides her father's penitence and carries on the fraud, and a male cousin, "who had no internal conscience. Any conscience he possessed was external." Besides all these we have a minor villain or two, an old family lawyer, a benevolent family doctor, a good clergyman and his gentle wife, an uncle and general who dies in the nick of time, an old cabinet with a secret drawer, scenery, metaphors, big words, philosophy, and rant. We have, indeed, a maze through which it is our hard task to attempt to guide our readers. Our only chance of not losing ourselves would seem to lie in sticking as close to the hero possible.

Philip Temple, then, was in his early manhood, as we have already said, an anxiety, a bugbear, and a volcano. He had at college sewn a crop of wild oats which had, we are told, been quickly regretted and forsaken. The metaphor seems to be somewhat confused, but the result was satisfactory. He was a martyr to theories, but he was now bent on virtuous courses. "The pendulum of his nature," as we read in another metaphor, which again is more satisfactory than intelligible, "having rebounded from the quarter to which his short course of recklessness had swung him, he was now more demonstrably virtuous than was exactly natural to him." Though we shall not be so rude as to require our author to explain the action of the pendulum, yet perhaps we may venture to ask what she means when she calls her hero "demonstrably virtuous." Had she said "demonstratively virtuous" she might perhaps have justified the expression which, as it now stands, is demonstrably meaningless. But to return to our hero. Finding himself without employment, "he suddenly accepted a subordinate post offered to him in a Government mission to Paris." A Government mission to Timbuctoo or to Khiva would have seemed more likely in these latter days than one to Paris; but then in neither of these places was the heiress Miss Agnes Mortimer to be found. She was a grand, dignified creature, with a cool, stately hand, and stately tenderness, whose beauty was rather that of a goddess than of a nymph. At this time the real heroine, Griselda Mortimer, was but a child; moreover, she was still unknown to the hero. Philip Temple therefore at once fell in love with the dignified creature, and was accepted. Soon after her father died, and she came into the ancestral estate. On his marriage he was to become through her the owner of Salehurst, and "to exercise his vocation of first-rate country gentleman." Salehurst was a place well worth owning, for it not only possessed the finest beech-trees in the county, but also it had a bedchamber in which Queen Elizabeth had reposed her regal head. The people of the neighbourhood had already begun to touch their hats to him with much respect as he passed, when the old family lawyer behaved in the most unlawyerlike manner. He told Philip that Agnes's grandfather, a short time before he died, had made a second will by which he had left the estate to Griselda's father, the gambler William Mortimer. This will, however, had never been found. The reader now understands the mysterious utterances of Agnes's penitent father, who, on his death-bed, had told her that he wished that a certain document should be found and acted upon at once. Philip insists that she should make restitution. She replies that, if her uncle went to law about it, there could be no question of the verdict. He rejoins, in terms that might puzzle the Lord Chancellor himself, "The law deals with generalities. It knows nothing of the great law of exceptivity." Exceptivity or not, she sticks to her estate and loses her lover. He goes home to his father. The old gentleman, knowing nothing of the old family lawyer, the hidden will, and the great law of exceptivity, naturally enough begins to talk about Agnes. His son merely said "'Agnes?' while his eyes gazed further away than ever." "What are you looking at?" asked the old gentleman; "what do you see?"—

> "A forest," said Philip, turning and fixing his eyes on his father, who involuntarily started—this strange son of his was so unaccountable and irrelevant in his speech—"and a man passing through it. The forest is dark and bewildering, and the man has lost his way. He is pursued by strange creatures and wild voices, and eyes staring at him." Philip shuddered himself, and paused for a moment; then he continued, smiling—"That is the conventional beginning, is it not? Can you guess what follows? The man is going on, following a rising path with a stream flowing beside and beneath it. The path leads westward. If he walks on, he thinks the sun will overtake him. There is a beautiful form waiting for him, with jewels flashing on her brow. She takes his hand to lead him. They go on together. He is following the same westward path, but he thinks it is she who is guiding him. The path is smooth now, edged with moss and flowers. Sometimes she drops a jewel, and he picks it up and treasures it. They are in the sunlight. It has overtaken him. He feels the light and the warmth, and calls on her to rejoice. But the sun has been too much for her: she is gone—melted—lost. He is alone. He has only the jewels left which she did not value. Yet he feels the sunshine. He cannot leave it. He is in the right path. He can't go back to find her, and she is vanished. She can't come to him—in the sunlight. Have you understood the parable, father?"

The father had not understood the parable. Indeed, unless he had spent his lifetime in reading silly novels, we do not see how he could have had a chance of even guessing at its meaning.

Philip went to live in London, where he studied Sanskrit, and was attended by an old man and woman imported from Whitechapel. In a few years he became of so much importance in the world that his communications to the editor were always inserted in the *Times*. He had meanwhile become very intimate with one Ralph Lindsay. Yet, if he had been prudent, he would have shunned him from the first. "Perhaps," the author says, "Philip was more susceptible to indefinable impressions than are most men. As he took Ralph's hand and met the look in his eyes, he felt a thrill run through his frame that made Ralph a person of importance in his sight from henceforth." These indefinable impressions are very useful to our lady novelists. They take the place which used to be held in our literature by gipsies and old women riding on broomsticks. Philip at once felt that, in some inexplicable manner, his lot was mingled with Ralph's. It was all a dim, undefined, incomprehensible sensation or revelation, but it robbed him of speech. How, we may again ask, though no longer in amazement, for we come far too often across such passages as these—how can any readers be found who will submit to so monstrous an insult being put upon their understandings as is implied in presenting to them such folly as this? Stories like these, we believe, are gravely read aloud in the family circle while crewel-work and embroidery go on, or while the obliging young curate holds the skein of wool as the thread is wound on the reel. Are there no Mr. Burchells left in the land, or Squire Henleys? Will no one shout out "Fudge," and no one venture to snatch the volume out of the hands of the fair reader and pitch it into the fire? But our indignation leads us too far from the particular instance of folly which must still occupy our attention. Ralph falls in love with Griselda, between whom and Philip had grown up at the same time "a very subtle relationship." Philip nevertheless was quite willing that Griselda should marry his friend; but Ralph saw that it was possible that "this subtle relationship might expand into mutual affection." Griselda hereupon talks to the hero about the temptations of life. These, it seems, according to this young lady's experience, "slap us in the face and stun us." As he was unable to make any reply to all this, they gazed into each other's eyes. The result of this gazing was by no means agreeable. "The future was impenetrable to them both; but the mysterious precursor of doom had laid his finger on them, and without recognizing him, they felt his presence." However, doom did not, as has been shown, trouble them very much in the end. A man who is to write M.P. after his name, and marry a heroine, might well have been confident throughout his career. Griselda, being defrauded of her property, gains her living by her voice, and becomes a famous singer. In spite of her brilliant success, it was generally prophesied that she would early quit her profession, and crystallize as a wife. She is pursued by a wicked Captain, with basilisk eyes. "She cringed from (*sic*) him," but a terrible doom seemed to be overtaking her. Where her difficulty lay in avoiding the villain is not very easy to see. At all events, in her despair, she becomes engaged to Lindsay as her only means of escape. Philip goes to see her, and takes her a present from her lover. "I feel choked, Lindsay, by presentiments," he exclaimed, before he started on his journey. "Lindsay," he adds, "did you ever speculate on the nearness of the unseen?" Matters get to so serious a pass that the author herself steps on to the scene, and, like a Greek chorus, exclaims, "I hear a rustling of the wings of Fate hovering round the head of her victim." Ralph gets a letter from his friend. He shivers as he opens it. He very wisely puts it down unread and makes himself a cup of tea. A few pages further on we have the chill touch of doom. Then, at a critical moment, a clock struck with the mellow (*sic*) suddenness that rouses one in deep stillness. Ralph discovers that Philip and Griselda are in love with each other, and at once falls into a fever and dies. He has just strength to write one word, "Traitor." Philip is full of remorse. "Why," he exclaims,

* *A Dreamer*. By Katharine Wylde. 3 vols. Edinburgh and London: Blackwood & Sons. 1880.

"can't I believe in some panacea? Why can't I shoot myself, or burn my hand, or open my veins, and let myself bleed till I fall from weakness?" As he cannot do any of these things, he manages to live for one volume longer, and in the end, as we have said, obtains a most respectable position and a most eligible wife, considering that he began life as an anxiety, a bugbear, and a volcano.

OUR FUTURE HIGHWAY.*

CAPTAIN CAMERON'S journey from the Mediterranean to the Persian Gulf must have seemed child's play and unmixed pleasure after his expedition across Africa. And, although an accident or an awkward encounter is always possible in travelling through an unsettled and semi-barbarous country, on the whole there would appear to have been no great danger in accomplishing a singularly interesting tour. The Turkish officials are always disposed to be civil to Englishmen bringing credentials or letters of introduction; and the zaptiehs whom they supply as guides or escort shelter the travellers under the authority of the Government. Consuls, English or foreign, are always delighted to welcome Europeans who bring them the latest intelligence of the civilization from which they are banished; Christians of all creeds and races are pleased to have an opportunity of airing their grievances, in the hope that representations in influential quarters may possibly bring them compensation and redress; while the Arabs show their proverbial hospitality, especially if their visitors are so well armed as to be formidable. There is always the chance of being waylaid by one of those bands of robbers who infest some of the hill ranges and whose hands are against every man; but even against hazards of the kind the odds are considerable. At the same time the undertaking is by no means smooth sailing, though Captain Cameron's resources as a sailor and veteran explorer stood him of course in very good stead. Dealing with Orientals of all ranks demands almost as much tact and patience, firmness and good temper, as managing the headmen of African villages, and the rank and file of the trains of negro carriers. They will persist in throwing obstacles in the traveller's way, partly from private reasons of self-interest, partly from constitutional procrastination and apathy. Then the behaviour of the traveller's followers is perpetually involving him in trouble; and a quarrel in the midst of a fanatical population may lead to very serious consequences. As for rough accommodation, that is of course to be expected. In their tent, which they pitched when camping in the country, Captain Cameron and his companion could always make themselves comfortable. But for the most part their halting places were in villages or cities, and then they fell back on habitations of stone or mud. It was no unusual occurrence, when arriving late in the night, wearied, wet, and hungry, to experience extreme difficulty in obtaining admission even to the public khan or caravanserai. Sometimes it was occupied already by a caravan, or was in the possession of shepherds and their flocks. Sometimes the keeper, from ill-temper or fanaticism, positively refused to receive them, until menaced by some official whom they had to hunt up. And occasionally he had locked up the chambers and gone away with the key. The fact of there being doors to lock seems to infer a certain amount of civilization; but the luxurious accommodation of these cells was limited to the lock and key. In these cases, however, Captain Cameron's seamanlike handiness came into play. He set himself to give a homelike appearance to their temporary quarters, and this is how he succeeded at Orfa, the ancient Edessa:—

> A mere cell of a room, with a door and a window and rough stone walls, we had converted into a comfortable-looking apartment. Round the walls we had put the sides of our tent, and eked them out with plaids. Our trunks, covered with plaids and rugs, formed seats, and our table, covered with books and writing materials, was in the middle. Guns were ranged in order; and on some large nails, which we always carried for the purpose, were hung our pistols, belts, field-glasses, and compasses. Aneroids, thermometers, and watches were arranged on their board, and it looked quite as if we had taken a long lease of the place, instead of being mere wayfaring wanderers.

Of the ten alternative routes suggested by projectors of different nationalities for connecting the West with the East by railway, the line of march followed by Captain Cameron is that which he believes to be the most practicable. And though he cannot pronounce upon the others from actual comparison and personal observation, he surveyed that of his own choice carefully and scientifically, confirming his previous prepossessions in its favour. The engineering difficulties are nowhere considerable; the hilly ranges that cross it may be surmounted by easy gradients; the chief engineering works of any serious cost are bridges, with here and there a long viaduct; while over vast extents of alluvial plain the rails might be laid, league after league, with no labour beyond that of smoothing the road. As for the prospects of the line paying commercially, he argues that even in point of local traffic there is a good trade to be counted upon even at present by cutting the ground from under the feet of the camels who transport produce laboriously and at heavy charges; that the country, which has been lying fallow in many places for centuries, is as capable of vast production as ever it was; that the multiplication of the primitive machinery for irrigation would reclaim much of the alluvial plain of the Tigris lying along the sides of the projected line; and that, though local capitalists will never take the initiative, they are ready and even eager to come forward as shareholders if Europeans will show them the way.

Captain Cameron landed in Syria at Beirut, passed northwards by Baalbec, Homs, Hamah, and Aleppo to Orfa, whence he turned westwards by Mardin to the Tigris at Mosul; thence he followed the course of the river by Bagdad and Bassorah to the Persian Gulf. His route lay through the remains, or at all events over the sites, of some of the most venerable cities in the world, and he gives exceedingly interesting sketches of their histories. It is a matter for congratulation that some of these should have been buried out of sight and memory, like the ancient Nineveh. There, at all events, the monuments of the past may be brought to light by laborious excavation. Elsewhere, wars, sieges, and storms have done their work; a succession of modern towns have been built out of the old materials; and, except where you come on the traces of the foundations of walls, or on some once impregnable fortress established on the solid rock, it is almost impossible to identify the archæological features. Even the stupendous ruins of Baalbec are in process of steady demolition, and their obliteration can be only a question of time unless the authorities can be persuaded to interpose effectually. It is to be regretted that a site which has no special recommendations had not been abandoned to the Bedouins and the jackals. As it is, we are told that the indolent inhabitants quarry the ruins habitually for their houses and fences. "During the last half-century several of the principal rows of columns have disappeared." After the visit paid by Captain Burton some years ago, cramps of iron were driven in here and there, to support stones and columns that were tottering to their fall. Since then these cramps have been actually stolen for the sake of the metal; while "some of the enormous stones which form one of the principal features of the place have been drilled and blasted."

Captain Cameron repeats the familiar story of townsfolk, farmers, and peasants groaning alike under a Government that oppresses while it fails to protect them. And a state of things which has existed ever since the Ottoman occupation had been aggravated by the consequences of the prolonged war. Owing to the desperate financial straits of the Porte, taxation had been increased and unsparingly levied. The central power, having its attention directed elsewhere, had given even less heed than usual to complaints against the arbitrary proceedings of its governors. Many able-bodied men had been withdrawn from cultivation to be drafted into the armies. Captain Cameron, by the way, who saw some of the regiments returning, speaks in the highest terms of the Turks as material for troops, though the officers neglected their duties disgracefully. But, above all, the inhabitants of certain unfortunate districts complained with much reason of their hard position, placed between the inexorable agents of their Government and the Bedouins. The sheikh of a village near Aleppo came out to ride some distance with the Christian travellers. The tale he had to tell was melancholy enough. The Bedouins, he said, used to levy black-mail on him, protecting him in return against the tax-collectors. Ten years before, the Turks sent a force of mounted riflemen, who kept the Bedouins at a distance and collected contributions for the State. At the outbreak of the war that flying corps was withdrawn. The Bedouins returned, exacted the full arrears of their black-mail, and further revenged themselves by refusing to interfere with the tax-gatherers who collected the increased war-taxes. Another class greatly to be pitied were the prisoners, who experienced precisely the same treatment whether under sentence following on conviction or while merely waiting their trial. Captain Cameron describes the scene in the prison of Bab, a small town only eighteen miles from Aleppo. In a vast arched chamber on the ground-floor, enclosed in front by a massive wooden grating and guarded by sentries with loaded muskets, were crowded together prisoners of all ages, some in chains and some unfettered. The offences they were charged with ranged from murder to inability to pay the Government taxes. Those who had money might buy food and tobacco; and in their Oriental acquiescence in the decrees of destiny they made themselves merry enough. The majority who had no money were in the extremity of starvation, so that the innocent peasant, who was merely a pauper, suffered far more than the murdering robber who had had the opportunity of emptying the purse of his victim. At the same time Captain Cameron remarks that no actual cruelty was intended. The state of things was simply due to the indifference which leaves an exhausted beast of burden to be devoured alive by jackals and vultures, instead of mercifully putting it out of its misery. As for the Christians, who were full of grievances which they expressed with much voluble plausibility, their lot seemed to be in no way exceptionally lamentable. Though they might have difficulty in obtaining redress for some particular outrage, their complaints of injustice when they were asked to state them in detail generally resolved themselves into vague generalities.

The hospitality which Captain Cameron received might sometimes have been oppressive to a man who had not gone through a course of rough cookery among the native chieftains of Central Africa. One improvised banquet which he describes was a fair sample of many. It was offered by a certain Mohammed Pasha, who had the reputation of being a notorious robber, and had stolen the affix of "Pasha" among other things. He had given

* *Our Future Highway.* By Verney Lovett Cameron, C.B., Commander, R.N. London: Macmillan & Co. 1880.

himself rank as a Pasha by corrupting his family name, and found the title serviceable. Whether robber or not, Mohammed seems to have been a fine fellow, fond of adventure, sport, society, and good living, though his cooking left much to be desired according to Western ideas. On the centre of the carpet was served "a huge platter, on which was a pile of rice deluged with ghee, surmounted by a boiled sheep, chopped up into little pieces without any regard to joints or proportions of fat, lean, and gristle." This was surrounded by bowls of lentil soup and piles of Arab bread, and succeeded by a second course in which "figs, mutton, honey, rice, fowls, and soup were impartially mixed together by the company." An obtrusively hospitable old gentleman seated next to Captain Cameron kept a watchful eye on the proceedings of his guest, stuffing him like a capon with unctuous morsels rolled up in the form of balls, whenever he showed signs of flagging. But their travelling life, on the whole, was a varied and healthy one; and habitual exercise invigorated the digestive powers. As the march often followed the banks of the river, Captain Cameron had fair sport among waterfowl; and, though unsuccessful in his attempts on the wild boar, had some exciting days among the islands and jungles of the Tigris. But what he chiefly enjoyed was coursing the gazelle with greyhounds, having been fortunate in picking up some excellent dogs, and still more lucky in being admirably mounted. The day may come when through travellers to our Eastern possessions by the Tigris valley route will break the journey among the mud flats of Mesopotamia for coursing and a little winter wild-fowl shooting.

IWANOFF'S BIBLE ILLUSTRATIONS.*

THESE Biblical compositions from the hand of a distinguished Russian painter present unaccustomed phases of art and conditions of mind. They take a new view of old themes—the Annunciation, the Announcement of the Angel to the Shepherds, and the Message to take the young Child and the Mother into Egypt; subjects which have grown somewhat threadbare under the reiterations of early and late Italian masters are here clothed afresh and reanimated by a life-giving spirit. And yet any originality which they may appear to possess may be assigned to ascertained causes. In the first place, we have here the voice of the Russian—that is, of the Greek—Church; hence these illustrations of the Old and New Testament differ from the readings of Giotto, Fra Angelico, Raffaelle, and other masters who laboured in the service of the Latin Church. And then, again, this allegiance to the Greek Church and to the Empire of the East naturally induces an affiliation to the art types and traditions of Byzantium; hence in these compositions are found surviving pictorial traits which throughout Western Europe have long since died out. Further, it is not to be forgotten that Alexander Iwanoff was by birth and in his sympathies Russian; and accordingly his style stands aloof from Southern systems, and claims close consanguinity with Northern lands and semi-civilized races, reflecting ethnological types which hitherto have been strangers to the world of art. The combined products of these causes strike the English eye as somewhat abnormal; yet all the more do these reproductions from the portfolios of an artist who in arduous endeavour was sustained by noble motive open a field for interesting speculation.

The life and labours of Alexander Iwanoff are little known beyond the Russian frontier, and the notice accompanying these chromo prints tells little more than that the painter was born in 1806 and died in 1858. We will add a few data which happen to have fallen under our own observation. The rise of modern art in Russia has been rapid; the growth can hardly be said to be indigenous to the soil, for there was no natural stratum out of which the stunted plant could spring; and so flower and fruit had to be fostered and forced as exotics. In fact, it soon became evident that Russia could not easily rear at home the art she needed, and that the shortest way was to transplant the painter bodily to warmer latitudes and brighter skies, where such latent talents as might exist would meet with the best chance of development. Accordingly a branch of the St. Petersburg Academy was founded on the banks of the Tiber, and students, finding the surroundings congenial, not unfrequently prolonged their sojourn in the Eternal City indefinitely; and hence it happens that the rarest products of the Russian school, such as the designs here before us, have been nurtured and matured in Italy. Iwanoff, though looked upon by the community of artists dwelling in Rome as a recluse, belonged to a goodly company. Almost all the great painters of Russia, such as Lossenko, Brulloff, Bruni, Neff, Gay, and Flavitsky, men who made a name throughout Europe by master-works like "The Last Days of Pompeii" and "The Brazen Serpent"—large, ambitious pictures, honoured by conspicuous positions within the Hermitage at St. Petersburg—perfected their academic and eclectic styles by persistent study in Rome. Alexander Iwanoff, in common with our countryman John Gibson, spent the best part of his life there; the thirty years during which he struggled to express noble thoughts in adequate pictorial form were associated with the labours of Thorwaldsen, Overbeck, Cornelius, and Gibson, all intent in their several ways on securing to the art of Central and Northern Europe a sound and vital revival.

Alexander Iwanoff overtaxed his physical power, though perhaps he scarcely over-rated his mental capacity, in pledging himself to immortality by one tremendous effort—a composition of thirty-five life-size figures representing the baptism of St. John on Jordan's banks with Christ appearing to the assembled people. The appreciative critic Count Raczynski, judging from preliminary studies, predicted that the picture would make an epoch in Russian art; and when we saw the completed work in the painter's studio about the year 1856, it had become the public talk of Rome. The artists in the Café Greco were unanimous in its praise; but Russia had hardly time to verify the verdict passed in its favour while fame or reward could come to the painter himself. The picture is in conception eminently original, as indeed are the designs now brought before the public. The multitude, draped and undraped, are gathered on the banks of the Jordan awaiting baptism; the Saviour in the distance approaches, but He is yet alone, and the silence and the solitude of the situation become impressive. The Baptist, clad in camel's hair, a dweller in woods and desert places, exclaims with upraised arms, "Behold the Lamb of God!" The art, as in the compositions here reproduced, is abnormal; the types are of a race almost aboriginal in form and physiognomy; the scene is laid neither in Italy nor in Palestine, but somewhere apparently far away as the wilds of Central Asia or Northern Siberia. Such are the wide-stretching geographic and ethnographic materials which Iwanoff gathered within the circuit of his far from homogeneous art. The painter died shortly after the victory he won. And the picture which we knew in Rome ere it had obtained distinction or gained a worthy destination, we met ten years later holding a conspicuous place in the public gallery of Moscow. The traits which strike Western Europeans as strange in type seem to seize strongly on the minds of the faithful in the Eastern or Russian Church. The popularity achieved by this almost repellent composition is attested by its publication as a coloured print sold in the streets at the price of a few pence. The Russian peasant has a craving for Biblical and legendary engravings, displayed and sold largely during fairs and at places of pilgrimage. The scenes depicted, as in the Biblical series before us, are usually stimulating and sensational; they bring into play the machinery of the supernatural, they abound in miracle. But poor Iwanoff, as we have indicated, did not live to enjoy the popularity which his highly seasoned art was sure in the end to win. We seem to see him now—silent and sad, careworn and broken in health—as he stood before the immense canvas into which for the space of twenty years he had breathed his thoughts and aspirations. He had borne up against poverty, he had struggled manfully through obscurity, and then, as the goal was reached, he died. Even in the proverbial calamities of genius few stories are more touching. But Russian artists overtax their powers, and are prone to break down prematurely under the severe tension. Flavitsky collapsed from want of rest, Brulloff died in harness, and Iwanoff barely lived to see his life's work accomplished.

Till the appearance of the present publication a reasonable account could hardly be given of how twenty or thirty years were overborne with labour, and why the artist at length sank under ill-requited efforts. The great picture of which we have spoken is not in itself adequate cause. But it now becomes apparent how during this protracted period the painter was maturing in thought and elaborating in form a series of more than two hundred compositions setting forth the dealings of God with the children of men. On the death of the painter in 1858 this pictorial Bible descended to his brother, an architect, and then, on the decease of the brother in 1877, the designs came by bequest to the German Archæological Institute of Rôme, as universal legatee, accompanied with the condition that "these scenes from the Old and New Testament should be published." An announcement signed by the President on behalf of the Institute states that the Directorate are anxious that this obligation should be carried out in conformity with the will of the testator, and in a manner worthy of his intention. They declare their conviction that the work will find a favourable reception not only in Russia, where the name of Iwanoff is in every mouth, but also in other countries. The painter, it is added, by the richness and vividness of his imagination and by the power of his representation, ranks among the most gifted artists of the new epoch. Further, it is anticipated that his compositions will raise special interest by a remarkable individuality or idiosyncrasy, which must be traced back to Russia, the native land of the artist. In the course of the publication a biography is promised which will assign to the painter his position in the history of art. The entire work will contain 232 plates.

These Biblical illustrations go far to justify the preceding encomium, though their somewhat fantastic or fanatic character may shock minds attempered to more moderate styles. One characteristic which cannot fail to strike the most casual observer is the bold and imaginative treatment of angels, such as may have been present in the vision of St. John in Patmos—beings of preternatural size and power, arrayed with four-fold wings, and environed with iridescent and light-emitting glories. The angel closing the eyes of Zacharias approaches with slow, solemn, and stately step, while the arm is stretched forth as with divine volition; the figure is statuesque, and sustains a poise between motion and rest, being both, yet neither. The Angel appearing to St. Joseph in a Dream shares, with others, Byzantine

* *Darstellungen aus der heiligen Geschichte; hinterlassene Entwürfe von Alexander Iwanoff.* Im Auftrage der Central-Direction des Kaiserlich Deutschen Instituts für Archäologische Correspondenz. Berlin and London: Asher & Co. 1879.

scale and immobility—traits which Cimabue, amid the early revivalists, took as an inheritance from the Eastern hemisphere of sacred art. The painter in many passages seems to catch inspiration from the glowing and mystic visions of Ezekiel; the angels are clothed in the bird-like wings of cherubim; they are orbed within moonlike spheres wherein are set wheels of radiating light and glory. Such scenes recall Ezekiel's vision—"Then the glory of the Lord went up from the cherub, and stood over the threshold of the house; and the house was filled with the cloud, and the court was full of the brightness of the Lord's glory. And the sound of the cherubim's wings was heard even to the outer court." The reader will readily believe how much of Oriental splendour shines within these designs. The golden seven-branch candlestick sheds a flood of rainbow colour within the court of the Temple, and light, with rays darting from the centre of all light, pierces as an all-searching eye, and dispels darkness from the place of revelation. We have seldom recognized in art so full a sense of the supernatural.

It is scarcely needful to wait for the promised biography to form an estimate of Iwanoff, and to assign to his creations their true position in the history of art. As already indicated, the style is impressed with the statuesque stateliness, and with somewhat of the stolidity, of the arts which centred in Constantinople—arts which still live and germinate on Mount Athos, as well as in the monasteries of Russia. Also, as before stated, these designs are flushed and fired with Oriental colour, a colour which, like that of Venice, has been reflected as an afterglow from the splendour of the East. And going still further eastward, from the shores of the Bosphorus to the banks of the Tigris and Euphrates, we find that the painter has borrowed from the bas-reliefs of Assyria the ample angel-wings which, like sails, float in air, or fall as ample draperies round the feet upon the ground. Yet one more noteworthy circumstance is that the simplicity of every-day nature is permitted a place within the sphere of the supernatural. Accordingly, St. Zacharias and St. Joseph appear as no other than old men, and the shepherds in the fields among the sheep, startled in their slumber, make no pretence to be more than ordinary peasants. By this approach to nature Iwanoff in the Russian school divides himself from the party of stagnation and of finality, and allies his art to action and progress. The churches in St. Petersburg and Moscow, richly adorned with paintings, are divided between styles old and new; the historic school of the past, coeval, at least in manner if not in date, with the mosaics in Ravenna, Torcello, and Venice on the one hand, and on the other the modern school of the present day, which takes models from actual life and seeks to represent and realize nature just as she is. Iwanoff holds a happy mean between these two extremes; he reconciles in good degree the real with the ideal, the secular with the sacred, the natural with the superhuman. The Russian Church, in the interpretation put upon the second commandment, denies herself the use of graven images; but just in proportion as she eschews statues does she espouse warmly the art of painting. Hence a wide field is open to those illustrations from the sacred narrative. Many pictorial Bibles have been attempted, but Iwanoff differs from all his predecessors. He is not so formal and academic as Raffaelle or Schnorr; he is not so exclusively spiritual as Overbeck; he does not introduce as much of outward and landscape nature as Doré among the French, Schirmer among the Germans, or Martin and Danby here at home. Among our English artists perhaps the position of Iwanoff may be more nearly found somewhere between Fuseli, Blake, and Stothard; and the approach would be all the closer if it had so chanced that the art of these painters had, like that of this great Russian designer, been identified with the Greek Church and the Byzantine Empire.

MARK TWAIN'S TRAMP ABROAD.*

MR. MARK TWAIN started for Europe in March 1878, with the intention of course of writing a book about what he did and saw. The result is the two volumes called *A Tramp Abroad*; and the first fault which a person who reads through the two volumes will probably be inclined to find with them is that they are two instead of one. On the other hand, nobody but a reviewer would dream of reading straight through the volumes. They are things to be taken for a spell and then laid down again until another idle half-hour is ready to be filled up. This would perhaps make a sufficient general answer to the reviewer's complaint; but it will not account for the carelessness with which, in the English edition, a good deal of matter which is obviously out of place is retained in the second volume. It may be interesting to some American readers to have put before them extracts from exceedingly well-known books about Alpine climbing; but it can hardly be interesting to any English readers. There is something not altogether unpleasing in the simplicity with which the writer waxes enthusiastic about the "imposing Alpine mass" of the Rigi; but one may have too much of that sort of thing. Besides, calling the Rigi by this grandiloquent name leaves the writer rather at a loss what to say about the Matterhorn. He gets out of it with some ingenuity by the help of such phrases as "colossal wedge," "sky-cleaving monolith," and "Napoleon of the mountain world." In speaking of the Matterhorn, by the way, Mr. Twain constantly refers to "Lord Douglas," although in one of the extracts above referred to the title occurs more than once, and is of course correctly given. However, if there are certain parts of Mr. Twain's volumes which are dull (and there is one story of an imaginary expedition the dulness of which, relieved by a very few bright touches, is monstrous and overwhelming), there are also plenty of passages, stories, bits of observation, scraps of character and conversation, and so forth, which are delightfully bright and clever. And a practised reader can always skip the dull parts.

One of the most pleasing instances of Mr. Twain's powers is found very early in the book. He wandered into the beautiful Heidelberg woods, and was standing in meditation beneath the pine-trees. A raven croaked. He looked up and saw the bird observing him, and felt as a man feels who finds that a stranger has been secretly watching him. "I eyed the raven and the raven eyed me. Nothing was said during some seconds. Then the bird stepped a little way along his limb to get a better point of observation, lifted his wings, stuck his head far down below his shoulders toward me, and croaked again—a croak with a distinctly insulting expression about it. If he had spoken in English, he could not have said any more plainly than he did say in raven, 'Well, what do *you* want here?'" This was bad enough, especially as Mr. Twain's refusal to bandy words with a raven only encouraged the adversary to the use of what was evidently the most horrible language. But when, not content with this, the raven called to another raven, and the two together discussed Mr. Mark Twain with the most complete freedom, he felt that there was nothing for it but flight, and he was probably right. This incident reminds him of Jim Baker, a simple-hearted, middle-aged miner who lived all alone in a corner of California, and had studied the beasts and birds around him so closely that he got, as he said, to understand everything they said. He found that some animals have a very limited language, and are unable to use any adornments of speech, while others have a fine and ready command of brilliant words and phrases, which they enjoy exhibiting. After long and careful consideration he had settled that the blue-jays were the best talkers he had found among birds and beasts:—

> There's more *to* a blue jay than any other creature. He has got more moods, and more different kinds of feelings than other creatures; and mind you, whatever a blue-jay feels, he can put into language. And no mere commonplace language, either, but rattling, out-and-out book talk—and bristling with metaphor, too—just bristling! And as for command of language—why *you* never see a blue-jay get stuck for a word. No man ever did. They just boil out of him! And another thing: I've noticed a good deal, and there's no bird, or cow, or anything that uses as good grammar as a blue-jay. You may say a cat uses good grammar. Well, a cat does—but you let a cat get excited, once; you let a cat get to pulling fur with another cat on a shed, nights, and you'll hear grammar that will give you the lockjaw. Ignorant people think it's the *noise* which fighting cats make that is so aggravating, but it ain't so; it's the sickening grammar they use. Now I've never heard a jay use bad grammar but very seldom; and when they do, they are as ashamed as a human; they shut right down and leave.
>
> You may call a jay a bird. Well, so he is, in a measure—because he's got feathers on him, and don't belong to no church, perhaps; but otherwise he is just as much a human as you be. And I'll tell you for why. A jay's gifts, and instincts, and feelings, and interests, cover the whole ground. A jay hasn't got any more principle than a Congressman. A jay will lie, a jay will steal, a jay will deceive, a jay will betray; and four times out of five, a jay will go back on his solemnest promise. The sacredness of an obligation is a thing which you can't cram into no blue-jay's head. Now, on top of all this, there's another thing; a jay can outswear any gentleman in the mines. You think a cat can swear. Well, a cat can; but you give a blue-jay a subject that calls for his reserve powers, and where is your cat? Don't talk to *me*—I know too much about this thing. And there's yet another thing: in the one little particular of scolding—just good, clean, out-and-out scolding—a blue-jay can lay over anything, human or divine. Yes, sir, a jay is everything that a man is. A jay can cry, a jay can laugh, a jay can feel shame, a jay can reason and plan and discuss, a jay likes gossip and scandal, a jay has got a sense of humour, a jay knows when he is an ass just as well as you do—maybe better. If a jay ain't human, he'd better take in his sign, that's all. Now I'm going to tell you a perfectly true fact about some blue-jays.

The "perfectly true fact" occupies the next chapter, and is well worth reading. To tell it in any words but those of Jim Baker would be to spoil it.

The author has naturally a good deal to say about the Heidelberg students, and he devotes considerable space to the duels of the Corps-Students, those curious encounters which take place at the Hirsch-Gasse, and which have been more than once briefly described in these columns. Mr. Twain seems to have been fortunate or unfortunate in seeing, on the day when he visited this place, a succession of unusually ghastly duels, and his impression of the whole proceedings was a good deal more serious than we should have expected. However, no doubt most of these duels do look ugly enough, and possibly Mr. Twain has deliberately heightened his description, for the sake of contrast to the very amusing skit upon a French duel which follows his serious account of the Hirsch-Gasse and its occupants. In some particulars this account is curiously incorrect. Mr. Mark Twain describes the schläger as "quite heavy." He has not noted that it is a weapon absolutely useless except for the artificial student-duelling, and, as he has given so much space to these unique and somewhat barbaric contests, it is a pity that it did not occur to him to try to throw some light on the origin of the schläger, that curious blade which resembles a sharp-edged harlequin's bat made

---

* *A Tramp Abroad.* By Mark Twain, Author of "The Innocents Abroad," "The New Pilgrim's Progress," &c. 2 vols. London: Chatto & Windus. 1880.

in steel and fitted with a solid claymore-like hilt. So lately as in Crabb Robinson's time the student duels were fought with small swords fitted with a button not on, but near, the point, so as to avoid the chance of a fatal wound, while admitting a visible and tangible puncture. How the altogether abnormal arm now in use was developed we have never been able to discover, in spite of many inquiries. That there is science in its employment there is no doubt; but the one fact that the heavily-padded right arm is constantly brought into requisition in the fashion of a shield to receive the adversary's blows, will show at once how useless, except indeed as a kind of corollary to backsword play, the science is. Mr. Twain dwells, by no means unjustly, on the endurance exhibited by Corps-Students in taking, without any signs of pain, cuts on the face, which always look ugly, must be considerably painful, and may, if neglected, be highly dangerous. The contrast between this endurance and the rule of the game which stops a duel for the slightest scratch on the hand caused by the flexible blade making its way inside the hilt opposed to it is curious. Mr. Twain, in connexion with the student-duels, informs his readers that a Corps-Student's wearing a riband across his breast indicates that he has fought three decisive duels and is "free"—that is, can refuse all but serious duels without reproach. As a matter of fact, it signifies that he has ceased to be a *fuchs*, or freshman, and, having become a *bursch*, or full member of the corps, has more fighting on his hands than he had before. We may note in passing that a *fuchs* in a duel wears a cap which gives some slight protection to the head, while a *bursch* fights bareheaded.

From his French duel the author goes on to the theatre at Mannheim, where he heard *Lohengrin*, as to which he has some astoundingly stupid would-be-humorous remarks to make. What he says, however, of the considerate behaviour of members of German audiences in never disturbing their companions is both true and well worth attention. Apparently his account of a raft journey is genuine, and some of the bits of description in connexion with this have truth and vigour. The truth and humour of his account of his getting lost at dead of night in the dark in his own bed-room can perhaps be only appreciated by people who have gone through the same experience, and for the sake of the world at large it is to be hoped that such people are few. In the course of his journeys Mr. Twain fell in with a wonderful guide-book written from the German a long time ago by an Englishman. Of this it is only fair to leave Mr. Twain to expound the humours, but we cannot resist giving a few quotations from a rival production which was presented to him under the title *Catalogue of Pictures in the old Pinacotek* (at Munich). Among the descriptions are:—

> Portrait of a young man. A long while this picture was thought to be Bindi Altoviti's portrait; now somebody will again have it to be the self-portrait of Raphael.
>
> Susan bathing, surprised by the two old man. In the background is the lapidation of the condemned.
>
> A larder with greens and dead game animated by a cook-maid and two kitchen-boys.

And the work contains this warning:—

> It is not permitted to make use of the work in question to a publication of the same contents as well as to the pirated edition of it.

Some of the best things in the book are to be found, where they are placed with a probably conscious air of pedantry, in the appendices at the end of the second volume. For instance, in an Appendix on the German language, we have this practical illustration of some of its difficulties:—

TALE OF THE FISHWIFE AND ITS SAD FATE.

(*I capitalise the nouns, in the German (and ancient English) fashion.*)

> It is a bleak Day. Hear the Rain, how he pours, and the Hail, how he rattles; and see the Snow, how he drifts along, and oh, the Mud, how deep he is! Ah, the poor Fishwife, it is stuck fast in the Mire; it has dropped its Basket of Fishes; and its Hands have been cut by the Scales as it seized some of the falling Creatures; and one Scale has even got into its Eye, and it cannot get her out. It opens its Mouth to cry for Help, but if any Sound comes out of him, alas! he is drowned by the raging of the Storm. And now a Tomcat has got one of the Fishes, and she will surely escape with him. No; she bites off a Fin, she holds her in her Mouth—will she swallow her? No; the Fishwife's brave Mother-Dog deserts his Puppies and rescues the Fin, which he eats himself as his Reward. O horror! the Lightning has struck the Fishbasket! he sets him on Fire; See the Flame, how she licks the doomed Utensil with her red and angry Tongue! Now she attacks the helpless Fishwife's Foot—she burns him up, all but the big Toe, and even *she* is partly consumed; and still she spreads, still she waves her fiery Tongues! She attacks the Fishwife's Leg and destroys it; she attacks its Hand and destroys *her*; she attacks its poor worn Garment and destroys *her* also; she attacks its Body and consumes *him*; she wreathes herself about its Heart and *it* is consumed; next about its Breast, and in a Moment *she* is a Cinder; now she reaches its Neck—*he* goes; now its Chin—*it* goes; now its Nose—*she* goes. In another Moment, except Help come, the Fishwife will be no more! Time presses—is there none to succour and save? Yes! Joy, joy! with flying Feet the she-Englishwoman comes! But alas! the generous she-Female is too late! Where now is the fated Fishwife? It has ceased from its Suffering; it has gone to a better Land; all that is left of it for its loved Ones to lament over is this poor smouldering Ash-heap. Ah, woful, woful Ash-heap! Let us take him up tenderly, reverently, upon the lowly Shovel, and bear him to his long Rest, with the Prayer that when he rises again it will be in a Realm where he will have one good square responsible Sex, and have it all to himself, instead of having a mangy lot of assorted Sexes scattered all over him in Spots.

Mr. Twain's volumes are, to quote a pantomime clown's phrase, very "loose and careless," and he has sometimes reached intense dulness in the desire to be funny. He is perhaps more irritating, however—and it may be added offensive—when he writes seriously, as in the chapter on "Indecent License in Art," concerning things of which he evidently has no sort of comprehension. But, we repeat, to people who know how to skip, and how to read, if they do read them, such passages as the one referred to without feeling annoyed, the book is sure to furnish a good deal of genuine amusement.

CLASSICS, LATIN AND GREEK.*

OUR readers will scarcely need to be reminded that, among editors of classics for the use of schools or colleges, Mr. Arthur Sidgwick has made the *Æneid* peculiarly his own; and a little consideration of the particular theme which he now undertakes will excite special interest, inasmuch as the Seventh and Eighth Books open and carry forward the second half of Virgil's epic—the Roman Iliad of battle succeeding the Odyssey of wanderings. The Seventh Book opens what may be called a new "diorama," in which pass in rapid succession "battle-pieces, sea adventures, councils of gods, single combats, feasts and funerals, splendid scenes and similes." Few efforts of epic genius transcend the account of Alecto's execution of Juno's bidding in rousing Amata, the Matrons, Turnus, and the Tuscan peasants to bitter hostility against the Trojan interlopers. The prefatory notes of the Introduction furnish all the needful prolegomena as to story, style, and similes; indeed we are not sure that the repetition of all this in each volume is not a needless concession to the theory that schoolboys use up a book in a term. But it is simply fair to add that in the commentary there is no repetition. Perhaps the true aim of the editor of such a brief commentary should be to give the learner a distinct view of the poet's mind, even in such parenthetical clauses as where, in speaking of the tomb of Æneas's nurse, the reservation "Si qua est ea gloria" (v. 4) qualifies the fame attaching to her sepulture there, because that honour may be naught, *i.e.* if Caieta cannot know or feel it—"a reference," says Conington, "to the insensibility of the dead." The transitive sense of "resonat," "makes echo"; the intransitive use of "posuere" in vv. 12 and 27; the probable interpretation in 37 of "Quæ tempora rerum," *h.e.* "each deed in due order," or "the times of all that befell"; and the coupling of "advena," a substantive, with "exercitus" as "the stranger-host" adjectivally, are severally noted, and give promise of similar exactitude to the end of the two books. But this eye to minutiæ does not interfere with such needful stage directions, so to speak, as the hint on the passage 36-37, that the poet's pausing at this point to invoke the Muse indicates a solemn and critical moment. In like manner the editor points out that in the account (vii. 107-147) of the fateful cakes, where the Harpies in the Third Book had portended a famine, driving them to eat their tables, the solution is a prophecy fulfilled to the ear, though not to the sense. And so too he has a word of explanation in matters of conflicting geographical details, *e.g.* at vii. 84, where Latinus "lucos sub altâ consulit Albuneâ, &c."; here the commentator seems driven to the conclusion that the Albunea of the text is not the Sibyl of Tibur, thirty miles off, but a shrine near some sulphur springs at Laurentum. Mr. Sidgwick has always laid great stress as an exponent of Virgil on questions of mythology and antiquarian interest, as witness his note in v. 180 as to Janus, "a genuine old Latin deity, god of morning and of gates, in fact, of beginnings," hence of gateways, as entrances and beginnings of expeditions. "It was like the Romans," as Mommsen (i. 173) remarks, "with their love of abstractions, to have a god of beginnings." A good specimen of the whole is the episode of Silvia's stag. How easily a well-practised scholar can conjure light out of darkness is seen in a single elucidation of Mr. Sidgwick's on the line 498, "Nec dextræ erranti deus abfuit." "Erranti," we are told, "is proleptic and gives the result of the verb"; "Nor did the God leave his hand to falter." We may supplement Mr. Sidgwick's touches by one of Professor Conington's on 502, 'Atque imploranti similis," where he notes that Dryden in his *Annus Mirabilis* talks of *the beseeching eyes* of a hunted stag.

Not less interesting in its way is the next group of school books on our list, each containing a sample of the soldier-historian and essayist, Xenophon—namely, two editions of one of his later opuscula, the *Agesilaus*, which reads like a somewhat overdrawn piece of hero-worship, and Mr. Pretor's edition of the concluding book of the *Anabasis*. Mr. Hailstone strikes us as conforming most closely to the exact type of a Pitt Press Series edition, being scrupulous to quote his references in full for every

construction, grammatical notice, or historical incident or comparison. In his prefatory discussion of the genuineness of the *Agesilaus* he adduces cogent reasons why it should be admitted, when we consider the long familiarity of the author with Lacedæmonian customs, manners, and discipline, and his obvious prepossession in favour of them. He also brings to bear upon the text those passages of the *Hellenics* which at first sight seem to convict the historian of not being at one with the biographer, explaining the discrepancies by pointing out the different task which Xenophon set himself in either case. We should say, however, that Mr. Taylor's edition of the *Agesilaus* is by far the pleasanter volume to study; the gist of all necessary collateral annotation is given explicitly and lucidly, without too much array of Greek, and certainly for young students, and perhaps also for others, it is likely to be the more popular book. We own to a sympathy with those critics who like Xenophon least in his character of panegyrist; in fact, the *Agesilaus* lags after the first and second chapters, which in Mr. Taylor's headings are represented as "Agesilaus in Asia," and "Agesilaus in Europe." When we get beyond these to the contemplation of the undersized, halt, mean-looking hero's continence, moderation, vigour and patriotism—so easy to extol when the opposite picture is furnished by the effeminate Persian despots—the panegyric is apt to become wearisome. Out of these two first chapters, therefore, we select the few notes of either commentator for which we can find room. In i. § 6, at ἔτι μὲν νέος ὤν, Mr. Taylor notes that Agesilaus was then over forty, so that the expression seems hardly suitable; but Mr. Hailstone anticipates this objection by citing *Anab.* II. i. 13, where Phalinus addresses Xenophon—then thirty-two years of age—as ὦ νεανίσκε. In i. § 7, on τριάκοντα Σπαρτιατῶν, Mr. Taylor notes that Agesilaus required these as a sort of council of officers, since Spartan citizens did not, as a rule, go on foreign service. The νεοδαμώδεις of the context were the enfranchised Helots who had received their freedom as a reward for bravery in war, and of these Mr. Hailstone notes that they ranked in civil rights above the Periœci. In i. § 17, Xenophon says, in eulogy of his hero, "He was thought to have acted in this worthily of a general, in that when war was declared, and to deceive became thenceforward just and right, he demonstrated Tissaphernes a mere child in deceit"; and here Mr. Hailstone assists the clearing of the sense briefly effected by Mr. Taylor, by pertinent parallels from Plutarch, Thucydides, and the *Memorabilia*, to prove the ancient belief that all—even τὸ ἐξαπατᾶν—is fair in war. In § 21 of the same chapter, noticing the humane policy of Agesilaus with reference to deserted children left behind by traders, whom he took care to have conveyed to some place without the camp, where they might be protected, both our editors note—Mr. Taylor succinctly, and Mr. Hailstone more at large and with a reference to Jelf's Greek Grammar—the correct use of the plural συγκομίζοιντο ποι, because παιδάρια, though neuter in form, is masculine in sense. So, also, as to the partitive character of the genitive in § 22, τῶν κατὰ κράτος ἁναλώτων τειχέων. That it may not be supposed that Mr. Taylor's succinctness of annotation leads him to omit aught that is vital to the elucidation of his subject, we might cite long and full historical notes in §§ 14, 15, 16, 21, 22, of the second chapter, where the omission of any prefatory prolegomena is amply made up for. He is also commendably alive to those comparisons of things ancient and modern which add double interest to the study of history; *e.g.*, on i. § 34, speaking of the Eastern claim of homage and prostration, and Agesilaus's abrogation of it, he recalls the fact that a similar claim has been in modern times, in such countries as China and Burmah, an impediment to diplomatic intercourse with Western nations.

Mr. Pretor's task in editing the Sixth or penultimate book of the famous "Retreat of the Ten Thousand" deals with only a limited range of events, between the Greeks' truce with Corylas, King of Paphlagonia, and the arrival of the first separated, and then reunited, troops at the port of Calpe. In form and style of annotation it deals more with the manner than the matter of the text, which, by the way, appears more than usually perplexed in this book, though we are bound herein to commend Mr. Pretor's vigilance and acumen. The passage in c. 1 (§§ 23-30), which refers to Xenophon's reasons for declining the offer of the supreme command, and leaving it to devolve on Cheirisophus, suggests to Mr. Pretor matter for some acute and generally plausible notes, and affords him ground for a charge against Xenophon of declining it from motives of self-interest; indeed, as is shown in his own account (vi. 1, § 31), it was not till he had exhausted all his series of excuses, and saw that he must try "*something more*" (πλείονος ἐνδέον), that he appealed to the ordeal of sacrifice. In § 18 of c. i. (cf. ii. § 12) it is well explained that ἐκ τῆς νικώσης (sc. γνώμης) is remarkable for an irregular use of ἐκ, where κατὰ with the accusative would be normal, and that its special force implies "At the suggestion of the decisive vote." Poppo translates "de sententia plurium." In ii. 14 we are disposed to agree with Mr. Pretor that, by αὐτῷ, in ἐπιτρέπει αὐτῷ, Xenophon refers to Neon, not to himself.

The other classics in the group before us recall the groove in which school and college editions are apt to run, and of which we have had occasion to complain heretofore. Must we still hear Cicero *De Senectute* lectured on *ad infinitum?* Is there never to be a change from the books of Cæsar's Commentary on the Gallic War? Doubtless Mr. Reid's edition of the former contains much collateral matter of value and interest to mature students, and it may be handled with profit with a view to the acquirement of Ciceronian Latin. He is especially instructive when he discusses such a word as "mancipium," and shows us how "emancipo" is susceptible of two such exactly opposite meanings as "to set free" and "to enslave oneself to." We constantly light upon some nicety of diction worth noting, *e.g.* in § 14, that "good lungs," as characteristic of an orator, are always "bona latera," never "pulmones"; that "propter," "hardly," used adverbially, is almost unprecedented out of Cicero; and that the repetition of the antecedent in the relative clause is not very uncommon in Cicero, though not so common as in Cæsar. The Dialogue itself has its interest as a sustained lecture on old age, based on models from Plato, Xenophon, Hippocrates, Aristo, and others, and the delineation of Cato's character is noteworthy. To our mind, however, there is no chapter in it of greater interest than that which dwells on the pleasure which the aged derive from the pursuits of agriculture, and in which is described the process of *occatio*, or "harrowing," though the philosopher was wrong in his *unde derivatur*. "Occa," says Mr. Reid, is *rastrum*, probably from its sharp points (root *ak-*; so Corssen), *occatio* harrowing. The date of the treatise is brought home to April 44 B.C.

Mr. Peskett's method of editing the Commentaries is such as to relieve them of the tedium arising from over-minute detail, while the careful comparison of the local knowledge collected in Napoleon III.'s *Cæsar* has been of manifest service in fixing particular localities. By far the chief interest of the Second Book concerns the day when Cæsar overcame the Nervii, the events of which are narrated by the great strategist with admirable clearness and candour. Doubtless the advent of the reserve under Labienus turned what might else have been a defeat into a victory, signalized by the conqueror as won over the most indomitable of foes; but it deserves commemoration how Cæsar fought himself in the ranks to rekindle the failing courage of his troops until such time as the reserve could come up. This battle offers a special field to Mr. Peskett for exact annotation of the text, from which we learn what a serious undertaking it was that the Nervii proposed to themselves, and how Cæsar's disposition of his forces foiled them. As a rule, Mr. Peskett's verbal notes are few, but sufficient. Such annotations as that on "de improviso" = ἐξ ἀπροσδοκήτου (c. 3) ought to be made once for all, and the changes of construction from the "ratio directa" to "obliqua" ought not to be reiterated over much, so as to leave nothing to the learner's wits. There is more interest when we catch the great despatch-writer napping, as where in c. 5 "magno opere" and "quanto opere" are repeated within two words of each other, and convict the illustrious general of "hasty writing." We may add that, whenever there is room for explaining such technical terms as "legionem sub sarcinis adoriri" (c. 17), or "testudine factâ" (c. 6), the editor is most explicit and accurate in his elucidations. His geographical and topographical knowledge, too, is conspicuous.

GERMAN LITERATURE.

PETER the Hermit (1) has always been one of the enigmatical figures of history. Great events are rarely brought about by insignificant agents, and, with every allowance for the temper of the age, it has seemed difficult to understand how an obscure person who never subsequently gave any indication of remarkable capacity or force of character should by mere power of speech have achieved the feat, traditionally ascribed to him, of "hurling Europe against Asia." It is now nearly forty years since Herr von Sybel in his History of the Crusades sought to transfer this dubious glory from Peter to Pope Urban II., and Herr Hagenmeyer now comes to his aid by a minute and detailed criticism on all the incidents of Peter's history as recorded by contemporary annalists. He certainly seems to establish that, although Peter may very probably have been subject to hallucinations, the legend of his vision at Jerusalem is a mere embellishment of the general fact. The account of Anna Comnena, who had conversed with him, distinctly implies that he did not succeed in reaching the Holy Sepulchre on his first pilgrimage, and that it was his disappointment at his failure, not a celestial commission, nor the entreaties of the Emperor Alexius, that incited him to preach the Crusade. Hagenmeyer further shows that the Crusade had been a project of Gregory VII., which his successor Urban might very naturally revive, especially under the stimulus of the embassy from Alexius, which appeared at the Council of Piacenza, six months before the actual assumption of the Cross at the Council of Clermont; and that there is not the slightest evidence of Peter having had any communication with the Pope prior to this latter Council, or even of his presence at it, although both are sufficiently probable. All such particulars are but the embellishments of later writers, which should have been propounded as plausible conjectures at the most. Herr Hagenmeyer's criticism seems unanswerable, and it inspires the more confidence as it is not pushed to extremes, but leaves the Hermit still in the position of an actual historical personage whose part in the great enterprise of his time was very considerable, although this was neither originated nor conducted by him. There seems little reason to doubt that he returned safely to his own country, and died as prior of a monastery founded by himself.

(1) *Peter der Eremite. Ein kritischer Beitrag zur Geschichte des ersten Kreuzzuges.* Von H. Hagenmeyer. Leipzig: Harrassowitz. London: Nutt.

Karl Grün's so-called History of the Culture of the Seventeenth Century (2) lapses insensibly into an ordinary narrative of political events, chiefly distinguished from other works of the class by the absence of the order and regularity which a stricter historical purpose would have imposed. The writer gossips pleasantly enough about a great number of interesting matters, and his opinions are in general sound and enlightened; but neither in narrative nor in disquisition does he rise for an instant above commonplace.

The story of Caroline von Linsingen (3) would make a very pretty addition to the *chronique scandaleuse* of the House of Hanover, if there were any truth in it. But, although it is credible that William IV., when Duke of Clarence, might have gained the affections of a young German lady under a promise of marriage, it is not credible that he should have been divorced from her so quietly that the world never heard of either transaction. It is even less credible that he should have made love in Hanover while living in England, where he appears, so far as we can discover, to have spent all his time between 1790 and 1792, the alleged date of these adventures. Mlle. von Linsingen certainly seems to have got hold of the wrong prince, which is a pity, for four other English princes actually were receiving their education in Germany in 1790. It will be for the anonymous editor of her letters to show whether there is any grain of truth at the bottom of her tale, for which a moderate amount of research might have prevented his making himself responsible. The story is conveyed in a number of letters written by her to her son-in-law at a later period of her life, and stated to have been discovered among the papers of the late Baron von Reichenbach. This is probably the fact, for they are accompanied by an essay "Upon Caroline's Sensitivity," which could hardly have been written by any one but the apostle of *od* force. The letters are couched in the high-flown sentimental style of the period to which they are attributed, and might pass muster fairly as compositions of Caroline von Linsingen; but one ascribed to the Duke of Clarence himself is a sore trial of the reader's faith. Mlle. von Linsingen will hardly take rank in history as a second Mrs. Fitzherbert; but it would be an interesting inquiry whether her story is an entire fabrication, and, if so, whether it may not, like the original draft of the Book of Mormon, have been originally intended as a romance.

General Mösle (4) appears to have been a meritorious officer of one of the minor German States; but the only remarkable incident in his career was his mission to Vienna in October 1848 as a Commissioner from the Frankfort Parliament, with the object of inducing Prince Windischgrätz to come to terms with the insurgent Viennese. He has left a lively account of the mission, which was inevitably a complete failure. Some miscellanies, autobiographical, critical, and political, make up the remainder of his writings.

The Life of Albertino Mussato (5), a poet and advocate of Padua and contemporary of Dante, affords some curious illustrations of the condition of the North Italian Republics at the beginning of the fourteenth century. He is further interesting as the author of the first drama upon a subject derived from Italian history, although written in Latin.

A comprehensive biography of Haydn, by R. Pohl, is in progress, with which the more recent biography of A. Reissmann (6) will hardly interfere. It is essentially a work for musicians, passing but lightly over the events of the composer's life, which were, indeed, not numerous or remarkable, and principally occupied with the analysis and exposition of his works. The author's excellent biography of Schumann is a guarantee for his competence in this particular, and the comprehension of his work is materially assisted by the numerous printed specimens of Haydn's music which it contains.

Dr. Pervanoglu's sketches of Greek life (7) would be a very pleasing book were it not so manifestly intended for foreign consumption. The writer holds a brief for his nation, and fatigues the reader with incessant encomiums of its virtues and apologies for its shortcomings, most of which might very well be taken for granted. The work is nevertheless interesting, from its pictures of manners and customs, its notices of local peculiarities, and its review of what has been done and what remains to be done in public works, education, and the restoration of the language to classic purity.

The first part of Dr. Wünsche's *Bibliotheca Rabbinica* (8) is devoted to Jewish commentaries on Ecclesiastes, which frequently shows considerable ingenuity in setting aside awkward questions suggested by the apparent meaning of the writer, and sometimes real penetration. The most interesting part, however, is the collection of tales, anecdotes, and parables serving as illustrations of the text, some of which are very suggestive from their characteristically Jewish colouring, and others from their analogies with the popular tales of other nations. One is substantially the same as the parable of the labourers who each received a penny, but the point is quite destroyed.

The genuineness of the Pastoral Epistles (9) attributed to St. Paul is notoriously one of the most difficult of the controversies relating to the canon of the New Testament. It is now once again investigated by Professor Holtzmann, one of the most eminent of German critical theologians and one of the least obnoxious to imputations of party spirit. Holtzmann's verdict is against the Epistles, on the ground of the difficulty of assigning them to any definite period in the life of St. Paul, their references, as he thinks, to questions and controversies of a later date, and their peculiarities of diction. They differ more in style, he says, from any of St. Paul's undoubted epistles than the earliest and the latest of these do from each other. He ascribes them to a period when the need of a stricter ecclesiastical organization was beginning to be felt, and considers them as the immediate precursors of the Pseudo-Ignatian Epistles.

Professor Keil's Commentary on Mark and Luke (10) is composed from a strictly orthodox point of view, but is purely critical and exegetical. It is dry, clear, erudite, and very full of matter, its brevity considered.

"Rome and Roman Life in Antiquity" (11) is the title of a popular, yet accurate and comprehensive, work by H. Bender, the first half of which appears in a cheap and handsome volume. The larger portion of this is devoted to a topography of the city, tracing its various changes from the early period when the Seven Hills were well-defined eminences, the sites of as many separate villages or fortresses, down to the time when the description of Poggio Bracciolini nearly corresponds with the features of the existing city. Chapters on Roman social and domestic arrangements conclude the volume, which is elegantly illustrated.

Dr. Manitius's "World of Language" (12) is a general review of the tongues of the earth in their intellectual and literary character. The first volume includes the languages of Asia, Africa, and Australia. The general physiognomy of the leading families of speech is ably characterized, and a fair, though concise, sketch of the spirit of the literature of each is added, with translations in many instances. The work makes no pretension to originality, but is well calculated to disseminate sound knowledge on the subject of which it treats.

Herr Faulmann's "Illustrated History of Alphabets" (13) is a professedly popular work, compiled from a great number of sources, and contributing little or nothing to the solution of the important philological problems connected with the subject. The compilation, however, seems to have been made with judgment, all the known alphabets of the world are noticed, and specimens given of them all, though these seldom comprise the whole of the alphabet. There are some interesting palæographical illustrations, and a useful appendix on printing and stenography.

The "Encyclopædia of Natural Science," (14) edited by Dr. G. Jäger and his associates, continues to make satisfactory progress. The last instalment of the mathematical section contains the conclusion of a treatise on planimetry, and the commencement of one on stereometry, both by Dr. Reidt. The articles in the zoological and anthropological section continue to be concise and well digested; and perhaps it is only prejudice which makes us impatient of what to the unaccustomed eye seems the singular mixture of Noah's ark with the gazetteer and the classical dictionary.

Dr. Hahn's discoveries (15) and his name conjoined irresistibly suggest associations with the idea of a cock and a bull. The theory that granite, gneiss, and serpentine should be of vegetable origin is sufficiently startling; but when the same assertion is made with respect to meteoric iron, we can but repeat with the Doctor himself, "besonders merkwürdig!" and express our humiliation that our countryman Sir William Thomson should be so far outdone. Dr. Hahn names the plant which he has discovered in shooting stars, "Astrosideron Quenstedti," and there certainly appears as much reason for believing in its vegetable origin as in that of the *Marmora Darwini*, which grows luxuriantly in the Doctor's writing-table, or of the *Stygia Rudolphi*, ejected from the crater of Pichincha along with other vegetable matter. It is only fair to add that Dr. Hahn's volume is accompanied with thirty plates of the streakings and dapplings in stone which he takes for fossil plants, and that the resemblance is sometimes almost as close as that of acicular crystals to pins and

needles, or of a well-known flint in the British Museum to a portrait of Chaucer.

The author of *Force and Matter* has collected a great number of instances attesting the capacity of animals for affection, compassion, self-denial, and other human virtues. Dr. Büchner's motive (16) is obviously to support the Darwinian theory; but, although this polemical intention has certainly imparted a bias to his book, it may be forgiven in consideration of the prettiness of many of the anecdotes he relates, and his eloquent exordium in praise of love as the animating principle of creation. Many—perhaps most—of the instances he produces in support of his views are insufficiently authenticated, but, with every deduction on this score, enough remains to prove that animals are a good deal more than mere machines.

The German language being confessedly the best adapted for translation of any in Europe, Herr Weizmann (17) is warranted in raising an outcry against negligent or ignorant translators who would take away its character. The translator of Daudet confounds *chouette* with *alouette*—a less excusable mistake than Juliet's; the translator of Dickens turns *a black glazed stock without a tie* into *a black lacquered stick without a knob*. There are a legion of other blunders equally amusing.

The *Rundschau* (18) has a suggestive, though brief, discourse by Professor Curtius, on the analogy between the history of Germany with that of Greece. The Professor considers that his countrymen have succeeded where Greece failed. Some may think that an analogy between Prussia and Macedon would have been more to the purpose. Ottokar Lorenz contributes an interesting account of Wallenstein's administration of his principality of Mecklenburg. Professor Brandes's acute and refined criticism of Prosper Mérimée exhibits him as the "Black Knight of the great Romantic Tournament"—a romanticist, partially disguising his tendencies under classical forms.

The *Russian Review* (19) perhaps betrays traces of its recent collision with the police in its careful avoidance of political topics, except in an article on Russian finance, which few but experts will be able to follow. The remainder of the number is chiefly occupied by two academical dissertations of a perfectly harmless character; one, a memoir of the philologist Schiefner, celebrated for his researches on Buddhism and on the Siberian languages; the other, a review of the progress of Russian geographical discovery during the reign of the present Czar.

THE PREMIERSHIP.

AFTER a week chiefly occupied by the ceremonial observances customary on such occasions, the formal resignation of Lord BEACONSFIELD made it on Thursday necessary for the QUEEN to select his successor. Her choice fell on the politician who for the last five years has been recognized as the leader of the Liberal party in the Lower House. In sending for Lord HARTINGTON the QUEEN doubtless was guided not merely by this consideration, but by the tone of Lord HARTINGTON'S own utterances since the result of the elections was practically decided. The speeches delivered by him a fortnight ago at Chesterfield and Darwen were those of a man who, if he was not determined to assume the chief command, at any rate expected that it would be offered to him. Yet it does not appear that Lord HARTINGTON, who cannot be supposed to have been surprised by the summons, was prepared immediately either to obey the QUEEN'S commands or to announce his inability to obey them. More journeys to and fro between Windsor and London were still necessary before the question of Premiership, which has exercised so many minds for the last few days, could be decided. The delay shows at least that the leaders of the late Opposition had not absolutely settled in their own minds the problem which others have been so busy in settling for them. It might easily have been arranged beforehand what each of the three possible Premiers should do in the case of his being summoned to Windsor. That Lord HARTINGTON'S journey was indecisive shows that neither he himself, nor Lord GRANVILLE, nor Mr. GLADSTONE, had arrived at such an arrangement, despite all the advice offered to them.

It was natural that when the result of the elections was known there should be much discussion and many conjectures as to the composition of the future Government; but it could scarcely have been expected that opposite parties should concur in urging as indispensable the appointment of Mr. GLADSTONE to the post of Prime Minister. If the Liberal members of the House of Commons could elect the head of the Government by ballot, it is probable that Mr. GLADSTONE would be left in a minority; and the great body of Conservative members may be supposed to think that his accession to power would be mischievous or dangerous; yet the newspaper press has been almost unanimous in recommending that the victor in the late contest should be rewarded with the spoils. Radical writers are perfectly consistent in demanding for their leader the direction of the national policy, though it is difficult to understand why they should place a superfluous difficulty in his way by offering gratuitous insults to the QUEEN. The clouds which are said to have interposed between the QUEEN and the nation must, if they exist, have been wholly raised by Radical pamphleteers and their sympathizing commentators. The relations of the Crown and the Cabinet have been in no degree modified under Lord BEACONSFIELD'S Administration, and there is no reason to doubt that the QUEEN will maintain the constitutional impartiality which she has displayed to a long succession of Ministers during more than forty years. Her volunteer advisers committed an impertinence when they demanded that she should pass under Mr. GLADSTONE'S yoke, instead of exercising her own judgment in the offer which she must make to some leader of the dominant party. They apparently desired either to expose the QUEEN to popular discontent in the probable contingency of her preferring the recognized leader of the party, or to attribute any overture which might be made to Mr. GLADSTONE to fear rather than to independent judgment.

The large section of the Liberal party which has for five years followed Lord HARTINGTON might have had something to say in the controversy; but it has been almost wholly silent. Notwithstanding Mr. GLADSTONE'S habitual denunciation of metropolitan journalists, his reluctant followers and possible adversaries, the moderate Liberals, have no recognized organ in the press. The legitimate and general wish that Lord GRANVILLE and Lord HARTINGTON should be the principal members of the new Government has in consequence scarcely found public expression, though it has been duly recognized by the action of the QUEEN. The preference for Ministers whose future course may be the subject of calculation is not confined to Liberals who distrust sentimental impulses as political forces. Some members who are not averse to large domestic innovations justly distrust a foreign policy which in the last Parliament was never accepted by the Opposition as a whole. Mr. GLADSTONE'S wanton declaration of hostility to Austria has not increased the general confidence in his judgment and temper. The character of a watch-dog, which, with unconscious plagiarism from Mr. ROEBUCK, he lately assumed, is scarcely compatible with the dignity of a Prime Minister. The intimation that his disapproval related to the foreign and not to the internal policy of Austria would have been an additional insult even if it had been strictly accurate. It is assuredly not the business of an English statesman to meddle with Austrian administration; but Mr. GLADSTONE has more than once referred in taunting or menacing language to the alleged antagonism of the various tribes which compose the Austro-Hungarian monarchy. If advanced Liberals are willing to incur the risk of Mr. GLADSTONE'S conduct of foreign affairs in consideration of his tendency to sweeping legislation at home, his less enthusiastic allies might have been supposed to regard with some anxiety the thirty urgent questions which he sometime since enumerated as illustrations of the negligence or incompetence of the Conservative Government. Even if Liberal members really believed that all the institutions of the country ought to be disturbed, they have not forgotten the effect of Mr. GLADSTONE'S restlessness during his former administration. It may perhaps have been right to harass, as Mr. LOWE has boasted, every interest in the country, but the operation proved to be highly unpopular. The prosperous years which ended about the time of the last general election had, in consequence of the Ministerial policy, produced almost as strong a feeling of irritation as the period of depression for which Lord BEACONSFIELD and his colleagues have lately been made responsible. It is surprising that the want of confidence in Mr. GLADSTONE which prevails among a large portion of the Liberal party should have been suppressed when it might have affected the choice of a Prime Minister.

The eagerness of Conservative politicians for the appointment of Mr. GLADSTONE as head of the Ministry is still more remarkable, as it is more short-sighted. Some of his opponents probably believe that his rash impetuosity would destroy any Government which he might control; but the experiment of raising an adversary to the highest summit of power in the hope that he may fall

is extremely doubtful. Mr. GLADSTONE's last term of office extended to five years; and it might have lasted longer but for an act of imprudent caprice. A more ostensible excuse for a paradoxical preference is supplied by the undoubted complications which must result from Mr. GLADSTONE's exclusion from office while his political activity is unabated. In his answer to Lord GREY he admitted that the disjunction of power from responsibility was inconvenient and even unconstitutional; but the anomaly has perhaps been exaggerated, and it is not for the interest of Mr. GLADSTONE's opponents to remove it at their own expense. That Mr. GLADSTONE would be more capable of doing harm as the patron of a Ministry than as a Minister is a proposition as unsound as the commonplace fallacy that an untrustworthy friend is worse than an enemy. A rash engine-driver would be likely to do more harm than a stoker who merely advised his comrade to go too fast. As an independent supporter of a Liberal Government Mr. GLADSTONE would be in some degree restrained by personal friendship, by good taste, and by loyalty to his party from interfering too officiously or too often. If he differed from the Ministers on questions of foreign policy, he would be powerless to impede or precipitate their action, because they would be supported both by the bulk of their own party and probably by the Conservative Opposition. In domestic affairs an independent leader would perhaps be more troublesome; but the initiation of legislation is inseparable from office. A Prime Minister, especially if he possesses personal ascendency, can almost always impose his policy on his colleagues, because they must either accept his measures or break up the Government. An extraneous ally can only undertake independent legislation at the risk of finding himself baffled by a coalition of the two regular parties. If Mr. GLADSTONE had been an independent member from 1868 to 1874, he could not have passed his Irish Bills, nor could he have established the Ballot or abolished purchase in the army.

The suggestion that Mr. GLADSTONE should hold a secondary office in the Cabinet is full of inconvenience. The custom by which the First Lord of the Treasury holds the rank of Prime Minister is founded on the large amount of patronage at his disposal. There were some exceptions to the rule in the last century, as when Lord CHATHAM held the Privy Seal on the understanding that he should direct the policy of the Government, though the Duke of GRAFTON was at the Treasury. It has since sometimes happened that a colleague has by superior ability or force of character overshadowed the Prime Minister, as when CASTLEREAGH, and afterwards CANNING, administered the Foreign Office; but both Ministers were on terms of close personal and political intimacy with Lord LIVERPOOL, and the Duke of WELLINGTON, who was a not less powerful member of the same Cabinet, was thoroughly loyal to his chief. As President of the Council, or Chancellor of the Duchy, Mr. GLADSTONE would control the deliberations of the Cabinet; and, in spite of any formal arrangement which might be made, he would be practically leader of the House of Commons. It would be much more convenient that he should also be Prime Minister than that he should be stigmatized as unfit to hold the nominal rank which corresponded to his real position. During the whole of the discussion the Radicals have, from their own point of view, been in the right, though some of their organs have given unnecessary offence by bad taste and violence. Those Conservatives who have insisted on the appointment of Mr. GLADSTONE have utterly misconceived both the public interest and their own. The timidity which has prevented the followers of Lord GRANVILLE and Lord HARTINGTON from expressing their genuine opinions is intelligible rather than worthy of admiration. After all, the discussion was idle, for the decision has from the first rested absolutely with Mr. GLADSTONE.

POLITICAL PROSPECTS.

THE present Parliament and the incoming Cabinet will probably be much more largely occupied with domestic legislation than with foreign affairs. Mr. GLADSTONE himself would be powerless to disturb the concert of Europe, although he still encourages his admiring correspondents in the Balkan provinces by mysterious denunciations of Austria. Knowledge, as well as power and popular support, is necessary to a statesman who seeks to influence the fortunes of Europe or of the world. Mr. GLADSTONE's acquaintance with foreign policy begins with the Bulgarian atrocities, and will end with the complete execution of the Treaty of Berlin. Few months have passed since he declared, in undoubted accordance with his habitual opinion and practice, that the external relations of England ought, as a rule, neither to be heard of nor seen. If Mr. GLADSTONE were at this moment absolute dictator, he would find the reversal of the policy of his predecessors difficult or impossible. At home the Ministry will be necessarily more active; but its prudent members will not be in a hurry to produce or disclose the dissensions which may hereafter destroy the unity of the party. Even the extension of household suffrage to counties seems for the moment to have receded into the background. The zealous proselyte who demands the disfranchisement of all owners of property has outstripped his new allies. The more moderate section of Liberals, though they have been pledged by Lord HARTINGTON to the dangerous measure of uniform suffrage, well know that every poor and ignorant voter whom they add to the constituent body will reinforce their formidable rivals. Some of them have perhaps derived from the Scotch University elections additional knowledge of the real division of parties. Of the graduates of the four Universities probably not a dozen are connected with the aristocracy or with the landed gentry; yet two Conservative members would have been returned but for the special claims of one candidate on an academic constituency. Mr. LYON PLAYFAIR seems not to add to his other qualifications remarkable tact or sense of fitness. Apparently irritated at the smallness of his majority, he reproached the electors with their regard to political principle, and threatened them with disfranchisement, which, he said, was desired by some of the members of his party. It is evident that the most highly educated portion of the middle class in Scotland has not participated in the factious excitement created by Mr. GLADSTONE.

The uneasiness which prevails among those Liberals who may be described as old-fashioned finds a curious illustration in the confused and inconsistent language of the *Edinburgh Review*. In the earlier part of an article on the new Parliament the writer professes exuberant delight at the defeat of the Conservatives, who for the most part hold opinions scarcely distinguishable from "plain Whig principles." It could scarcely have been expected that the organ of a party which once was aristocratic should be especially delighted with the electoral disasters of the great families which are now on the losing side. Still stranger is the exultation created by the supposed "wavering of the farmers in their allegiance to the "squires." It seems that they are beginning to find out "that the debtor and creditor have opposite interests, and "that a disguised landlord's agent is not the best possible "tenant's champion." The relation of landlords and tenants has seldom been described in terms pointing so directly to legislative spoliation of the creditor; but it is satisfactory to find that the unfamiliar cant of revolution is immediately retracted, unless indeed two writers of opposite principles have agreed to compose an *amœbean* eulogy on the two conflicting forms of Liberalism. The debtor and creditor, or, in other words, the landlord and tenant, "have opposite interests"; but the Whig interlocutor proceeds to contradict his Radical associate by asserting in the same page that "the interests of landlords and "tenants are not at variance; we believe them, on the "contrary, to be inseparable and identical." If the response or antiphon is to be preferred to the previous statement which it contradicts, the substitution of two or three tenant farmers for landowners will leave untouched the interests which are common to both. In another part of the same article the reviewer, not perhaps understanding the effect of his proposal, recommends that the county franchise should henceforth be limited to occupiers, so that the owners of all the landed property in the kingdom would be summarily disfranchised. Only resident proprietors would be represented, and not in regard of their property. Owners of houses or land in boroughs now vote for the county; but they are to share in the arbitrary disqualification. Converts from plain Whig principles seem to be intoxicated by their first intercourse with unscrupulous democracy.

With a singularly bad grace the *Edinburgh* Reviewer follows the example of Mr. GLADSTONE and Sir W. HARCOURT by sneering at that society with which his period,

the other hand, although they fought well, manœuvred badly, and much popular indignation was excited in Chili at the tedious course which the war seemed to be taking. But in time the rules of modern international law told against Peru. It is permitted to import arms and stores of war if the importers can escape the vigilance of cruisers. The subject of any neutral State who likes to incur the penalties of carrying contraband can do so, and Peru was able to import arms and stores freely. The Chilian cruisers tried to intercept these consignments, but generally failed in the attempt. It is not permitted, however, to sell and despatch an ironclad, and so well was the rule observed that Peru could not find anywhere an ironclad that she could purchase to repair her losses. As the navy of Peru could not be replenished, the Chilians, who had from the outset a supremacy of naval force, had only to go on until at last they reduced the navy of Peru to nothing or to a mere shadow. By land Chili found that, when once she commanded the sea, she could attack under cover of her fleet, and she did attack, and has had the best of the fight. It is very difficult from the geographical configuration of Peru for the military force of an enemy to move forward quickly. The invaders have to make their way along a mere strip between the mountains and the sea, and to move over ground destitute of supplies and frequently broken into points where resistance can be easily offered. Still the command of the sea, the possession of the chief sources of Peruvian wealth, and some successes on land would have entitled Chili to expect Peru to sue for peace, and Peru would before this in all probability have attempted to save what was left to her if she had had anything to save. How it has happened that a State which a little time ago could bleed lenders to any amount for which she liked to ask, had nothing left to save, is a curious instance of the proverbial insecurity of the wealth attributed by popular fancy to the American colonies of Spain.

The *Times* has lately published a series of letters from a correspondent who has been travelling in Peru, and these letters, which are written with vigour and ease, will refresh the memory of the few Englishmen who know Peru personally, and will supply information too late to be of any use to the unfortunate bondholders who have sown their cash broadcast without knowing anything of the country to which they were sending it. Peru, as persons who have had the good fortune to be educated in National schools are doubtless aware, is a very long and not very wide country, with a wall of mountains running at no great distance from the sea coast. Unfortunately all the natural wealth of Peru is on the wrong side of this mountain wall, which rises even in its passes to a height of more than fifteen thousand feet. On the seaboard side of the wall there is a continuous stretch of barren, ugly, waterless rocks, broken by one good harbour, that of Callao. A cold current of air streaming from the South Pole along the coast so plays with the vapours arising from the Pacific that while for one half of the year there are constant clouds, yet there is never any rain. The moisture is lifted over the Andes, and there is condensed into abundant rain, which nourishes a prolific vegetation and supplies the sources of the affluents of the enormous rivers that ultimately find their way into the Southern Atlantic. On this side, too, nature has placed the rich silver deposits of Cerro Pasco, so that it may be said that in the accessible parts of Peru there is nothing worth having, while everything that is worth having is inaccessible. But off the coast of the accessible side was found the guano which gave Peru so strange a burst of temporary prosperity. When the guano came to an end it was obvious that Peru must come to an end unless the provinces which contained all its solid and indestructible wealth were made accessible. As far back as 1862 President Pardo, who was not long ago murdered, drew the attention of his countrymen to their real situation. He calculated that guano had already at that time given Peru as much as 30,000,000*l.*, and he urged that the future yield should not be entirely wasted, but should, at least in part, be spent on an enterprise that would open up new possibilities to Peru, and protect her against the collapse of her fortunes. The project was a very bold one. It consisted in running a railway from Callao straight over the Andes, and then down again, until it ended where a navigable river would have given a waterway to the Atlantic and to Europe. When the line had surmounted the Andes it was to have sent out two branches, one to the silver mines of Cerro Pasco and another to a district rich in every kind of agricultural and forest produce. This was an undertaking very arduous and very costly, especially as another line over the Andes was projected and partially completed; but Peru would have been saved if the line from Callao had been carried out, and she was in the singular position that she could have practically had the railway for nothing. Her accidental ownership of guano would have enabled her to unite for ever, and without further cost, the two halves of the country. Peru really set in earnest to have this railway made, and her energy was stimulated and directed by the ingenuity and boldness of an enterprising American. Enough has already been done to make the line, so far as it has gone, one of the greatest feats of mountain engineering in the world, if not the greatest. 140 kilometres have been opened for traffic, and the line has been carried to a height of more than 11,000 feet. A rise of about 4,000 feet still remains to be accomplished; but enough has been done to account for the absorption of much money, and to proclaim the triumph of engineering skill. The railway, however, is only a project so far as the connexion of the two halves of the country goes. The money is gone, and the guano is gone, and the enterprising contractor is dead, and accessible Peru is still as much divided from inaccessible Peru as ever.

There is no apparent source from which, if the war stopped, Peru could draw new life, while, if the war goes on, the Peruvians have the pleasure of fighting. This is a real pleasure to them, and the more they suffer the more they like the war. Troops are collected by wholesale impressment, and Peruvian Indians fight well and eat nothing. The resistance of a nation which fights because it thinks it has sustained "defeats more glorious than "victories," because it hates its enemies bitterly, and above all because peace and war are equally ruinous to it, must collapse in the long run, but may last much beyond what its opponents expect or think reasonable. The blockade or the bombardment of Callao would do much harm to the foreign colony of Lima and to the small remnants of commercial activity that Peru still possesses. But there seems to be no reason why it should make the Peruvians give in. To hurt Callao is not to capture Lima, and the Chilians have not as yet shown anything like the military strength which would enable them to take possession of the capital. It must also be considered that while Peru has lost the guano, Chili has not only got it, but has begun to deal with it. Negotiations have been for some time going on between Chili and the Peruvian bondholders. The nature of the proposed bargain, which is said to have been at length concluded after many difficulties, is that the bondholders are to receive guano from Chili, and to pay Chili for giving it to them. Chili holds the guano by right of conquest, and any concession to the bondholders must have been chiefly prompted by calculations as to what course would be most likely to raise or establish Chilian credit in the European market. At any rate Chili has cut away from the Peruvians the hope that by making peace they can get back their guano. Chili would necessarily, in any arrangement with the bondholders, stipulate that the guano should be given over after peace to the bondholders, not to the Peruvians, and for Peruvian purposes it might be as well cast into the sea. To have to pay their just debts will be only an aggravation of injury to men who have long had nothing but their plunder from guano contracts to live upon. The real difficulty of Chili is that she has scarcely anything to offer to Peru as the reward of peace. She can offer not to bombard ports, but the bombardment of ports only damages a few merchants and the inhabitants of the place. She can also offer not to make any more military descents on the Peruvian coasts. But these military descents do not carry the war much further forward, and always offer the enemy a chance, and by no means a bad chance, of a partial and temporary success. Meanwhile Chili, which has a real credit and a solid reputation to keep up, is undergoing a most serious pecuniary drain; and it is not impossible that, in spite of the substantial successes of Chili, there may be found to be a greater desire for peace at Valparaiso than at Lima.

THE HOME RULERS.

THE election for the county of Cork, which completed the returns for Ireland, surpassed in interest and importance all that had preceded it. It was supposed that Mr. PARNELL would achieve his crowning victory, and would secure the return of a devotee unknown in the county, displacing Colonel COLTHURST. The seat of Mr. SHAW was not directly attacked; but Mr. SHAW earnestly deprecated a contest, and, had Mr. PARNELL's nominee been returned at the head of the poll, not only would Mr. SHAW's wishes have been disregarded, but his leadership of the party would have been rudely shaken. Mr. PARNELL indulged in his usual vituperations of an antagonist, and denounced Colonel COLTHURST as having truckled to the Saxon and neglected the interests of his constituents. On the one side were arrayed Mr. PARNELL as dictator, the small farmers who look at the land question through his eyes, and the peasantry who believe that he is the man to do something for them which no one else can do. On the other side there were Mr. SHAW himself and those who honestly accept him as their leader, the gentry, the humbler electors who resented the intrusion of an outsider, and, above all, the priests. The contest was really a pitched battle between the priests and Mr. PARNELL, and Mr. PARNELL had so often beaten them that the priests strained every nerve to show that in a great Southern county they still retained their boasted influence. In the end Mr. SHAW was returned at the head of the poll by a majority of nearly 2,000 votes; while a narrow but sufficient majority of 150 gave the second seat to Colonel COLTHURST. The party is now definitively split into two sections, of which that of Mr. PARNELL is the weaker, although the more violent. Nominally a show of union is still retained. Mr. PARNELL asserts that he has always been the most docile of men, and that his readiness to obey in the past, which has cost him the most painful sacrifices of feeling, ought to be taken as a guarantee that he will be equally amenable in the future. Mr. SHAW says that he always counts his sheep, even if some of them are a little blacker than he could wish, as belonging to the same fold. But this union is only nominal. Mr. SHAW treats the following of Mr. PARNELL as obviously deficient in the first rudiments of common sense; and whenever united action is proposed it is immediately declined. As soon as Mr. SHAW had announced that he intended to be present at a gathering of the party in Dublin on the eve of the meeting of the new Parliament, Mr. PARNELL wrote to say that he certainly should not attend the meeting, and that he thought that to go there would be a very silly waste of time. Personal bitterness also has arisen to an extreme point in the ranks of the Home Rulers, and Mr. SULLIVAN has declared that he will rather vacate his seat for Louth than sit as the colleague of Mr. CALLAN, who owed his seat to the patronage of Mr. PARNELL. The Home Ruler, too, whom Mr. CALLAN defeated declares that he will not offer himself to replace Mr. SULLIVAN if to sit for Louth would impose on him the ignominy of being the colleague of Mr. CALLAN. What Mr. CALLAN has done that is thought so unpardonable is not evident. He is accused of having asked for Saxon gold to pay his expenses; but Home Rulers must be supposed to know where their own shoe pinches, and can perhaps feel other grievances which they cannot state. The case is only worth noticing as bringing into special prominence the dissensions which are distracting the party.

The most striking feature in recent Home Rule contests and utterances is that Home Rule appears, at least for the moment, to have dropped almost entirely out of sight. Mr. SMYTH indeed remains true to his colours, and has devised the best formula for Home Rule that has yet been offered. His motto is, a Free Senate and a Citizen Army; and this is really what Home Rule means, when it is made to have any definite meaning. But other Home Rulers talk, not of Home Rule, but of the land. Mr. PARNELL devotes himself exclusively to his peculiar form of land agitation, and Mr. SHAW feels drawn towards the new Parliament as destined to do something with regard to the land which has never been done, nor perhaps dreamt of, before. It is the fashion for every one to regard his own peculiar subject as the turning-point of the late elections, and Mr. SHAW seems convinced that English electors thronged to turn out Lord BEACONSFIELD in order that a comfortable provision might be made for Irish farmers. He has tried to define the future attitude of his party towards the Liberal majority. He will endeavour to get from this majority what he wants, and if he cannot get what he wants, he will stand aloof. It would, as he says, argue a want of earnestness if he settled into the position of a tame Whig. But he warns his party that, if what it desires is to be got, it must make itself pleasant, show itself moderate and forbearing, and even make large allowances for Liberal leaders who have to overcome the prejudices of ordinary Englishmen against every proposal for benefiting Ireland in the way in which Ireland wishes to be benefited. Nothing, as he truly says, can be more absurd than to suppose that the way to make England yield is to seize her by the throat, and bid her stand and deliver. This amounts to a formal declaration against the policy of obstruction, and the position of the Obstructionists will probably be found to be weaker in the new Parliament than it was before the dissolution. It is true that Mr. PARNELL has increased his personal following. He has now at his command a band, many members of which are as utterly unknown in Ireland as they are in England, and who have no other avenue to importance except that of obeying him implicitly. He has now got six-and-twenty satellites instead of six, to speak after his pattern, and to waste time as he wishes; but he cannot pursue a course of wanton obstruction without at the same time proclaiming that he is breaking away from the leader of his party, and is representing only the minority of Home Rulers. The fear lately entertained that he had Ireland behind him has been dissipated, and Obstructionists who obstruct in the name of Home Rule will be regarded as an unimportant set of noisy disturbers. It is probable that the new Parliament will be much less indulgent to obstruction than the last. It is bent upon doing something that will win it real credit, and will form a striking contrast to the inactivity of its predecessor. Those who are bent upon business cannot tolerate idle opposition with the amiable placidity which is natural to men who bring in Bills only to weep gently over their inevitable failure. The Liberal leaders, too, have always been for dealing with obstruction in a more stringent way than found favour with their good-humoured and undecided opponents. And if there is one claim which they have put forward more prominently than another at the late elections, as the object of their peculiar care, it is the claim of the House of Commons to be treated with respect and to be enabled to uphold its dignity. The Liberal majority will feel that to allow Parliament to be set at naught by a handful of noisy Irishmen would be a treason to the constituencies, which have been pointedly told that the honour of Parliament shall be zealously maintained.

The fact, too, that Home Rule is out of date, and has been superseded by the land agitation, will make the relations between the Liberal majority and the Home Rulers comparatively smooth. The new Government may be expected to bring in some measure for dealing with Irish land; and although this measure will necessarily disappoint unreasonable expectations, still it will be, in the view of Home Rulers, a step in the right direction, and a peaceful interval must be allowed to elapse in order to give time for any Bill, bad or good, being prepared. It has been said that Mr. BRIGHT would be glad to resume office with the one object of putting before Parliament an Irish Land Bill after his own fancy. It is not probable that even this temptation would induce him to encounter the fatigues of office, or to busy himself, or feel that he ought to busy himself, with the cares of administration, of which he must have very unpleasant recollections. But if he has any longing to bring in an Irish Land Bill, and thinks that he could draft it easily and carry it quickly, he must have a very inadequate conception of the difficulties that would beset him. From no quarter has there as yet been any suggestion made of a Bill that would give Irish tenants any considerable portion of what they ask for without infringing elementary rules of justice or subjecting the State to onerous obligations. A new Ministry cannot invent and shape an Irish Land Bill without much previous thought and study, and nothing would so much discredit it as to wear the appearance of being willing to introduce crude schemes rather than none, in order to show the greatness of its energy, and make use of its magnificent majority. Meanwhile the Irish seem to be occupying themselves with personal rather than political questions. Above all, they interest themselves in the great problem of who is to be the new Lord-Lieutenant. It is even considered to be a point of

the deepest interest to Ireland whether the wife of the unknown Lord-Lieutenant is likely to be popular. The smiles of beauty and the charms of manner can always make Irishmen more or less happy; and to Englishmen it is pleasant to notice this side of Irish life, and to find that to speak of the feeling of Ireland is occasionally much the same as to speak of the feeling of Ascot on the Cup Day. But man is a composite animal, and it is not to be supposed that Home Rule makes up the whole life of any one, not even of Mr. FINIGAN. A popular and sensible Lord-Lieutenant, with a pleasant and active wife, does real good in a thousand ways; and it is to be hoped that a Liberal Ministry will be again as fortunate as it was in the days when Lord and Lady SPENCER reigned in the Castle.

THE PANAMA CANAL AND THE CLAYTON-BULWER TREATY.

EITHER M. DE LESSEPS is too sanguine in assuming that the obstacles to the construction of his canal are removed, or he must have entered into some arrangement with the Government of the United States, which cannot for the moment be conveniently disclosed. The interesting statement that a hotelkeeper at Chicago refused to send in a bill for entertaining M. DE LESSEPS is not in itself a conclusive proof that he will be allowed to make one of the most useful of all possible public works. Material difficulties vanish before the energy of the vigorous and cheerful octogenarian. Between the two oceans there appears to be only one hill of the moderate height of 120 feet, and the supposed unhealthiness of the Isthmus is disproved by the freedom of a party of a hundred and thirty persons from any kind of illness. It is true that there is a considerable mortality of Chinese coolies; but M. DE LESSEPS is ready with a pleasant and satisfactory explanation of a fact which might otherwise cause uneasiness. The Chinese might, if they thought fit, live for an indefinite time in the best of climates; but unluckily they are in the habit, in consequence of certain morbid tendencies, of committing suicide on a large scale. M. DE LESSEPS has ascertained that an ordinary Chinaman deposits his savings at the foot of a tree, and then hangs himself on one of the branches. He is supposed to believe that, after voluntarily departing this life in Panama, he will rise again in China with his hard-won earnings, having saved the inconvenience and expense of the voyage across the Pacific. If the great projector has occasion to employ Chinese labourers, he will probably make it worth their while to postpone their euthanasia till the canal is finished. There is no doubt that by some method the necessary labour may be procured, and that the enterprise is physically feasible if sufficient capital is forthcoming. Of the more serious political impediments M. DE LESSEPS speaks but lightly. Although he is not prepared to assure his friends that the American Government has withdrawn its objections, he intimates his belief that his assurances have been favourably received. According to his account, the management will be in the hands of the subscribers; and he implies that a purely commercial undertaking will provoke no national jealousy. It is not impossible that he may have secretly acquiesced in the pretensions of the United States.

If no such understanding has been established, the scheme is likely to fail or to be indefinitely delayed; and in any case capitalists will require more definite information before they advance their money. It matters little whether the projectors have international law on their side, if they have not secured the consent of a Power which can prevent the construction of the canal or control its navigation. The American Government has not been slow to assert claims which are incompatible with the design of M. DE LESSEPS, unless he thinks fit to become the agent and dependent of the United States. Some time since the PRESIDENT, in a Message to the Senate, declared that the MONROE doctrine would be infringed if any interoceanic canal were constructed except with the sanction of the American Government. The Senate Committee of Foreign Relations, which exercises some of the powers that in England belong to the Foreign Secretary, has reported in accordance with the PRESIDENT's Message; and the Senate, though it has not yet taken any step on the subject, will probably confirm the decision of the Committee. Believers in the force of the system which is figuratively described as International Law would find the process by which it is now to be altered instructive, if not encouraging. The Republic of Columbia possesses the absolute dominion over a tract of land on which it authorizes a commercial Company to construct a canal. It might be supposed that in the first instance it was unnecessary to obtain the consent of any third party; though, when the communication is opened, foreign Governments may properly demand freedom of passage for their subjects; and as among themselves equality of treatment. The MONROE doctrine, which was an *ex parte* declaration in no way binding on foreign Governments, has, even if its validity is assumed, no relation to the proposed undertaking. At the instance of CANNING, who entirely failed to foresee the consequences of his suggestion, President MONROE nearly sixty years ago declared that the American continent was no longer subject to settlement by foreign Powers or to extension of their actual dominion. CANNING's object was to prevent ALEXANDER I. and METTERNICH from interfering in the dispute between Spain and the South American colonies. The Government of the United States perhaps foresaw the advantage which might be derived from a vague protest against an improbable enterprise. There is no question of settlement or of acquisition of sovereignty on the Isthmus of Panama, and M. DE LESSEPS and his associates are private adventurers acting under the authority of the local Government. On the other hand, it may be argued that the Power which for its own purposes invented the MONROE doctrine has an equal right to extend it, or to establish a HAYES doctrine as its supplement. The question is wholly as to power, and not as to right. The expulsion of the French army from Mexico, and the consequent overthrow of the Empire of MAXIMILIAN, are the most instructive corollaries of the MONROE doctrine.

If the common law of nations is elastic in its interpretation and uncertain of execution, positive contracts in the form of treaties are more definite, and it might have been supposed that they were more binding. The conditions on which a canal between the Atlantic and Pacific is to be constructed and used are, as between England and the United States, expressly defined by the Treaty of 1850, negotiated by Mr. CLAYTON, Secretary of State, and Mr. BULWER, afterwards Lord DALLING, English Minister at Washington. It now appears that this formal agreement is to be overruled to make room for an entirely novel American pretension. The Senate Committee for Foreign Affairs pronounces the treaty to have been ill-advised, often infringed, and always inoperative. On these grounds, which it might be difficult to establish by proof, the Committee recommends that the PRESIDENT should take immediate steps for the abrogation of the treaty. Among private persons it is no objection to a bargain that one party afterwards thinks that it is ill-advised, or, in other words, that it might operate to his disadvantage. It is certain that the Treaty of 1850 has been in no degree injurious to the United States, as American interests were understood when it was concluded. It has undoubtedly been inoperative as far as it affects a proposed canal which has not yet been constructed; but a contract which provides for a future state of things can scarcely be invalidated by a delay in a proposed arrangement. The covenant which the Americans seek to rescind seems not to be in itself unreasonable. It was agreed that neither Government should acquire possession of any part of the country to be traversed by the canal; that their subjects and citizens should enjoy equal rights of passage; and that the canal should be subject to a joint protectorate.

Of other clauses in the treaty the United States have already had the advantage. Before that date the English had established on a part of the Central American coast an anomalous dependency called the Mosquito Kingdom, nominally ruled by a native Indian chief. The Americans regarded with a jealousy which, if it was exaggerated, was not unintelligible, a condition of affairs which seemed to conflict with the MONROE doctrine. They declined to recognize the sovereignty of a native; and, on the other side, Lord PALMERSTON took a fancy to the Mosquito Kingdom, which he governed through an agent under the title of Consul. The CLAYTON-BULWER Treaty put an end to the supposed grievance by abolishing the English protectorate, and incidentally the Mosquito Kingdom, which has not since been heard of. The Americans were perhaps not much the better for the concession; but they had professed to think it important as long as it was withheld

The steps by which the PRESIDENT is to proceed to the abrogation of the treaty are not specified in the Report of the Committee. It may be hoped that no English Minister will consent to the simple repeal of the treaty, even if he is unable to prevent it from being broken. It would be intolerable that a single Power should either have exclusive possession of the canal, if it is made, or that it should secure a monopoly of the trade with the Pacific, with New Zealand, and with the coasts of Asia by the imposition of differential duties. No MONROE doctrine can give the United States a right to annex to the detriment of foreign countries a territory which is now independent, and which is separated from American territory by hundreds of miles. There may be room for negotiation if the PRESIDENT and Senate are willing to guarantee freedom of passage and equality of rates. On any other terms it would be unwise to renounce an undoubted right, which it might possibly become necessary to maintain by force. The interest of all Europe would be in this case identical with that of England, unless indeed the United States should bribe any Government to desert the common cause by the offer of especially favourable terms. A one-sided denunciation of the treaty ought to be treated as absolutely void. No such measure can in any way affect English rights, though it may be judicious to wait for a convenient opportunity of asserting them.

THE FRENCH CLERGY AND THE RADICALS.

THERE is something quite edifying in the discoveries which the French Left are daily making with regard to the secular clergy. Hasty observers have supposed that M. FERRY and M. GAMBETTA had no love for the Catholic priesthood generally. They have been believed to share to the full in that hatred for the cassock which is commonly entertained by Continental Radicals. Their special hostility to the religious orders was explained by the facts that the religious orders were unpopular—at least that the Jesuits were so—and that obsolete laws still in existence gave the Government means of annoying them, which were wanting or could not be conveniently used in the case of the parochial clergy. It turns out that the distinction between Seculars and Regulars which it was proposed to consecrate in the seventh clause of M. FERRY's Education Bill is not of this accidental kind. M. FERRY, in a speech he has lately been making to the electors whom he represents in the Council-General, is as complimentary to the one as he is hostile to the other. We are in presence, he says, of two very different priesthoods. One is the clergy of the Concordat, the clergy of the parishes, the clergy whom we know, whom we reverence, to whom we are bound by contract, and who, within the limits fixed by that contract are the dependents of the State. The other is the clergy of the Congregations, a clergy whom we know not, and who desire to remain unknown by us, a clergy not foreseen by the Concordat, a clergy who, under all sorts of names and in robes of all colours, wish to form outside the Church of the Concordat another Church, altogether dissociated from the State, recruited and enriched at the expense of the recognized clergy, and depending entirely on a foreign sovereignty. It is against this latter clergy that the French Government have been forced to take up arms. They have done so as much in the interest of the pillaged and oppressed parish priests as in that of the State. Wicked and designing bishops have written as though the decrees against the religious orders were measures directed against the Catholic Church. On the contrary, they are designed to relieve the Catholic Church from an incubus which left to herself she has not the strength to shake off. The *République Française* makes M. FERRY's words its own, and adds to them others in the same strain. Never, it says, will the secular clergy be treated by serious and instructed men having the charge and the responsibility of Government in the way in which the regular clergy are now to be treated under the provisions of the ecclesiastical law. To be the working parson of a French parish is a very different thing from being a Jesuit or a Capuchin. The State has one policy in respect of monks belonging to orders whose chiefs live at Rome, and another in respect of Frenchmen who have embraced the sacerdotal state and are fulfilling their duties under the authority of the law. It sees in the former a friend and a servant, in the latter a stranger and an enemy.

There is a foundation of truth in this distinction, which, under other circumstances, might have been of real service to the Government. The secular clergy have never been over fond of the regular clergy. They have been in the habit of thinking that in the division of rewards and work they have had too much of the work, and the religious orders too much of the rewards. A country curé may have more liberty than the member of a religious order; but he buys it at the cost of hard fare and dull labour. The stimulus of ecclesiastical controversy is denied him; he has only to go on year after year christening, marrying, and burying his parishioners, and eking out with such fees as he can obtain for these services the pittance of 24*l.* a year which the munificence of the State allows him. When he compares with this the comparatively exciting duties of the religious orders—the schools for the upper classes maintained by the Jesuits, the Lent preachings of the Dominicans—he would be more than human if he did not sometimes think his lot a hard one; and if the Left had managed their attack upon the religious orders with more judgment, they might have found allies of some value in the secular clergy. In order to do this they should have begun by rendering some substantial service to the secular clergy, and should have been careful not to let their dislike of the religious orders be mistaken for dislike of the Catholic Church. Instead of this, the Left refused to raise the salaries of the parish priests, while they assailed the religious orders on grounds which would have supplied an equally good ground for an attack upon Catholic laymen. No matter what M. FERRY or the *République Française* may say, the object of Radical hostility is not any specific aspect of Catholicism, but Catholicism itself. M. PAUL BERT's denunciation of the Jesuits in the Chamber of Deputies resolved itself into an attack upon the confessional, and the manifestations of Radical feeling with which the priests are most familiar, are found, when looked at closely, to be entirely superior to any nice distinctions between one kind of ecclesiastic and another. It is Catholic dogma, Catholic practices, and Catholic persons that the French Radical dislikes, and, ordinarily speaking, he has not sufficient command of his emotions to be civil to his parish priest, even though he has the opportunity of rewarding himself for his self-denial by openly insulting a monk. The consequence has been that the secular clergy mistrust the Radicals nearly as thoroughly as the religious orders mistrust them. To all appearance the new decrees have found French Catholics a perfectly united body. The regular clergy are regarded simply as the advanced guard of the ecclesiastical army. The antagonism which formerly existed between them and the regular clergy has disappeared in presence of the common foe, and such assurances as those lately given by M. FERRY are treated as so many falsehoods told with a purpose.

It is not surprising that this should have come about. The Radicals have found the task of making believe to like the secular clergy too hard for them. Here and there an opportunist speaker may try to be civil to them; but for the most part the effort is too trying, and is never seriously made. Indeed the younger Radicals would scorn the notion of making it. Speakers like M. CLÉMENCEAU do not pretend to see in the religious orders something to be hated, and in the parochial clergy something to be loved. They hate them both, and they avow it. They are as anxious to suppress the ecclesiastical budget, and to leave the clergy to the casual contributions of their economically minded flocks, as to banish the religious orders. The ideal Republic which M. CLÉMENCEAU described the other day was a Republic which should accord to the priesthood, whether secular or regular, nothing but a temporary and contemptuous toleration. Not even their churches were any longer to be left to them. The fabrics belong to the State, and the State would no longer be so inconsistent as to lend them for the performance of a particular type of religious worship. If the parochial clergy turn for comfort to the *République Française*, they find, it is true, a different treatment of the subject from that adopted in the *Justice*, but hardly one which is calculated to give them much more comfort. It is something to know that M. GAMBETTA is not in favour of striking them off the list of State pensioners, but when they read that the reason why they are to be retained in this position is that they may be kept in proper order by

r, their hearts may well fail them. They know what became of the Constitutional clergy in the First Revolution, and the part reserved for them by the *République Française* is likely in the end to prove very little better than this. On the whole, therefore, there is no reason to believe that even the moderation of tone which characterizes the references to ecclesiastical questions in M. DE FREYCINET'S Circular will win over the secular clergy to the Republic. That they could even now be won over is probable enough, but it must be by a very different policy from any that a Government which relies on Radical support can be expected to adopt. The Radicals will look with favour on no Cabinet which will not allow them to shake their fists at the Catholic Church, and so long as a Cabinet leaves its supporters free to amuse themselves in this way, it will not hold its own with any section of the Catholic clergy.

THE *ATALANTA*.

THERE is happily no need as yet to despair of the safety of the *Atalanta*. If she were to arrive in Falmouth to-day she would have been eighty-four days in coming from Bermuda, and such a passage, though long, is not by any means of unparalleled length. The same period has recently been occupied in making the voyage, and H.M.S. *Viper* was still longer in getting to Bermuda from England. Quite lately a vessel which met with no accidents, but was merely delayed by contrary winds, was ninety days in coming from New York to the Thames; and it is certain that violent north and north-easterly gales have swept across the track from Bermuda, so that homeward-bound sailing-ships may have been driven far off their course. For a week to come, therefore, the arrival of the *Atalanta*, or, at all events, reassuring intelligence about her, may be hoped for; but at the same time it would be puerile to deny that, though loss or disaster is still anything but certain, there is reason for very grave apprehension. From the tone of the Admiralty circular which was issued last week it was clear that serious fears were felt by those most competent to judge regarding the safety of the ship. The *Atalanta* had the reputation of sailing fairly well, and, like most vessels of her type, could beat well to windward. The fact of her being long overdue is therefore more alarming than it would be with many other vessels. To the absence of tidings respecting her during any part of her voyage too much weight has perhaps been given, as even on what are considered as crowded tracks, a vessel may still be solitary for a considerable time. In the famous race of the tea-clippers ships which were pursuing a similar course, with comparatively favourable winds, were out of sight of each other for very long. Far graver than the fact that nothing has been seen of the *Atalanta* is the fact that the worst possible weather is known to have prevailed in the Atlantic at the time when she was making, or may have been making, the passage. It is often said that a good ship with plenty of sea-room need not fear the heaviest gale; but this, like many other general statements, is not universally true. There are some mishaps which baffle the skill of the best seamen, and one of these may have befallen the *Atalanta*. It is not in the least likely that, if lost, she has been lost in the same way as the *Eurydice* was, inasmuch as the capsizing of that ship was undoubtedly due to the neglect of precautions which ought to have been taken; and the lesson is little likely to have been forgotten. We may safely assume that Captain STIRLING did not allow the maindeck ports to be kept open after the barometer had given him unmistakable warning. If the *Atalanta* has gone down, the misfortune has probably been due to some combination of circumstances against which skill and foresight were of no avail. Of this, however, it will be scarcely possible to convince the multitude; and, if the missing vessel is no longer afloat, her loss, coming so soon after that of the *Eurydice*, may have very serious results. It must of necessity shake the confidence of the seafaring population in training-ships; and, though seamen are perhaps more fearless than any other class of men, their distrust, when once aroused, is deep and long-lived. The consequence of the calamity which is now dreaded may be a greatly increased difficulty in manning the vessels in which man-of-war sailors are trained, or at least in finding volunteers of the best class.

It is to be hoped that this feeling of distrust, which, under any circumstances, will be strong, will not be augmented by the efforts of critics anxious to prove that the Admiralty always has blundered and always will. As has been said, the best seaman may lose his ship, and very possibly the *Atalanta* may have been as fit to meet the winds and waves as any sailing-vessel could be. The whole history of the frigate will doubtless be carefully examined, and the result of the inquiry will very probably be to show that there was no reason whatever for dreading any mishap to her other than such as must be dreaded for all sailing-vessels. On one point, however, prompt explanation should be given, in order to anticipate malevolent criticism, and to show that an obvious and most important precaution was not neglected. The *Atalanta* was, it seems, built in 1844, and was therefore thirty-four years old when she was commissioned as a training-ship. The ordinary life of a wooden vessel is reckoned at sixteen years, and as the existence of the *Atalanta* had extended over more than twice this span, it is clear that, before she was allowed to go to sea with three hundred men on board, she ought to have been subjected to the most minute and searching survey that could possibly be made, and to have had every repair executed for which the smallest necessity appeared. We doubt not that this was done, and that it can be clearly shown that there was no neglect of precautions which were so obviously essential; but full information on the subject should be afforded, and an account should be given of the measures which were taken to ascertain the condition of the ship, and of the manner in which defects which surely must have existed were made good. It seems, at first sight, a strange thing to allow a wooden vessel thirty-six years old, with three hundred people on board her, to meet the winter gales of the Atlantic, and it should be manifest that, before she was commissioned, the *Atalanta* was proved to be in thoroughly sound condition. It is to be observed that, after sailing during a certain period as a frigate, the *Atalanta* was turned into a police hulk. This may have been either because vessels of her class were thought to be no longer useful, or because she was judged to be no longer fit for the sea. If the latter was the reason why she was laid up, a grave responsibility certainly weighs on those who allowed her to be equipped as a training-ship. Not long ago a wooden man-of-war on the Australian station was found to be in such a state that, had she encountered a gale of wind, she must almost inevitably have sunk. It is scarcely possible, however, to believe that the *Atalanta*, despite her age, was in a defective state, or that the necessity of testing her soundness and strength in every possible way was overlooked.

Assuming, then, as is indeed most probable, that the vessel was perfectly strong and seaworthy, and that, as is also most probable, there was no neglect whatever on the part of those in charge of her, the *Atalanta* may still have been lost in the open sea. Unless, as has been suggested, she was wrecked off Bermuda, she must, after she had made part of her way home, have been exposed to gales of unusual severity. A sailing-vessel laying-to in a gale may be placed in great danger if, owing to a change in the direction of the wind, she has to bear up and run in order to avoid falling into the trough of the sea. She incurs the risk of being "pooped"—that is, of being overwhelmed by a great mass of water breaking over the stern—and the number of sailing-ships which have been thus sunk is not small. A ship of good stability and well handled may be capsized if a sudden gust such as occurs sometimes in a gale catches her at the end of a very long roll. In some of the statements which have appeared respecting the *Atalanta*, it has been said that there was little danger of her capsizing, owing to her "stiffness" or power of resisting the heeling action of the wind. This shows some misapprehension of the nature of the ship's stability. The *Atalanta* is a very broad vessel, carrying a small quantity of ballast. She would therefore have great righting power at moderate angles of inclination, but if pressed over much her righting power would probably be largely diminished, especially if a considerable proportion of her water tanks were empty. It may be thought that so good an officer as Captain STIRLING cannot have neglected the obvious precaution of filling the tanks with salt water; but it must be remembered that they may have been left intentionally open in order to obtain ease in a sea. From what has been published respecting the vessel, it seems clear that she was a heavy roller in a gale of wind.

The loss of the *Atalanta* in mid ocean through causes altogether beyond human control must therefore be regarded as a possible, though very improbable, catastrophe. Of the accidents which may have occurred through want of vigilance or skill we do not desire to speak, as they are manifold, and as we prefer to believe that there has been no lack either of good seamanship or of watchfulness. Fortunately all speculation may shortly be set at rest, either by tidings of the missing ship or by her safe arrival. She may have lost a mast, and made slow progress under jury rig, or she may have suffered so much in the gale as to be obliged to take refuge somewhere in the Azores. If, however, there is no news of her during the next two or three days, the Admiralty would do well to reassure the public on the one point concerning which they can give certain information. It should be made clear that the *Atalanta* was not dangerously weakened by age. A vessel thirty-six years old may spring hopeless leaks in a gale which a new and strong ship would weather without harm or danger.

NUISANCES AND LEGISLATION.

THE important inquiry into effluvium nuisances in which the Local Government Board has been engaged for the last five years is at length completed. Dr. BALLARD's Report is now before the public, and they will wait, perhaps with interest, to see what steps the new Government will take to give effect to its conclusions. It is necessary to qualify the expression of this expectation because the interest which the public, even persons whose comfort is most directly affected, take in the abatement of nuisances is singularly small. Men who will spend time, money, and trouble in getting redress for an injury to their pocket—a redress which very likely leaves them poorer when it is obtained—will endure a far more costly injury to health with comparative indifference. They grumble a little, as they grumble at such purely inevitable evils as a wet summer or a cold winter, but that is all. They hardly seem to regard nuisances as preventable annoyances. When the Noxious Gases Bill was before Parliament last year, Mr. SCLATER BOOTH probably received ten deputations from the manufacturers who inflicted the injury for every one he received from the districts which suffered under it. The public who are stifled by noxious gases stand to the manufacturer who generates them in the relation of consumer to producer. In the protectionist controversy it is found that, except in very special cases, the eagerness of the producer to put his rivals at a disadvantage is far more effective than the eagerness of the consumer to get his wants supplied cheaply, and a similar rule seems to hold good in the nuisance controversy. The health of a whole district suffers because the manufacturers engaged in a certain trade will not forego the extra profit derived from using an offensive process instead of an inoffensive one. It might be thought that in a matter where the many are pitted against the few, the many would necessarily win. As a matter of fact, it is almost always the few who win, and who in a sense deserve to win. The authors of the nuisance show real energy in defending their right to produce it. The victims of the nuisance hardly seem to know that they suffer under it. Indeed, this indifference is one of the surest signs of the injury that has been done them. They have become so acclimatized to breathe poisonous gases that no immediate ill result follows, and consequently no strong desire is felt to get rid of them. The process by which the mischief is done is usually a slow one. Sometimes it takes a generation to make its effects clearly visible. An experienced medical man, whose practice includes Northfleet, where some of the largest cement manufactories are situated, told Dr. BALLARD that during the last thirty-five years he had noticed a marked deterioration in the general health and aspect of the population. The people have become "pale and pasty-faced," and diseases "have "altered to a lower type." This is the kind of report which is constantly made in these cases. In one sense—the sense in which the words are most commonly used—many of the nuisances with which Dr. BALLARD's Report deals are not injurious to health. There is not, that is to say, any specific form of acute disease that follows immediately upon exposure to them. The sense in which they are injurious to health is a more subtle, but not for that reason a less hurtful, one. They alter the whole constitution for the worse, and, in doing so, they inflict more harm upon the community than many more directly destructive agencies. A nuisance which attacks life injures the actual sufferers and those dependent on them. A nuisance which attacks the constitution injures not only the actual sufferers, but the generations which, by reason of their bad constitutions, will come into the world less fitted to fill their proper place in it than they would have been had they been born of healthy parents. In this fact State interference with nuisances probably has its orgin. National health is slowly coming to be recognized as an important element in national prosperity. That the community is bound to protect its members against avoidable discomfort as well as against avoidable disease is as yet hardly an accepted proposition.

If the issue lay plainly between injury to manufacturers and injury to the public there would even now be little hope of any good result. It seems so shocking to an Englishman that trade should be interfered with—even if the object of the interference is the health and happiness of the community for whose benefit trade is supposed to be carried on—that a good deal more suffering would probably be inflicted and endured before any effective remedy would be applied. Happily Dr. BALLARD's inquiries point to a different conclusion. "It is commonly "found in practice to be as much to the interest of the "manufacturers as of the public that the emanations from "offensive processes should be arrested." It may be objected that, if this is so, there can be no need of administrative or Parliamentary interference. What it is to a man's interest to do he may surely be trusted to do of his own accord. But this theory directly conflicts with everyday experience. Men do not always know—it may almost be said that they seldom do know—their own interest in matters which involve the immediate spending of money and departure from practice and tradition. A manufacturer may know that, if he had the capital necessary for the adoption of a particular process, his profits would in the end be larger. But if he does not possess the necessary capital, it may take all the pressure that Parliament and a Government department can bring to bear to induce him to raise it. Nor must it be forgotten that the introduction of new processes ordinarily demands a degree of intelligence on the part of the workman which is not always forthcoming. There are processes which, though in proper hands they answer their purpose very well, do not answer it at all if they are carelessly applied. The consequence is that a manufacturer sometimes incurs considerable cost in abating a nuisance only to find that his money is gone, while the nuisance remains where it was. These causes, and others like them, combine to indispose manufacturers to consult what in a sense is their own interest in the matter of nuisances; and the only means of neutralizing these causes is to call into being some unmistakable inconvenience which can only be averted by the adoption of the improved processes. A manufacturer's readiness to move in this direction is strangely and illogically quickened by the discovery that he will be fined if he goes on in his old way. He may be losing far more than the amount of the fine by his refusal to do what the medical officers have suggested; but it is the thought of the fine that seems eventually to determine him to do as he is bidden. The knowledge that in insisting on his obeying the law the State is only forcing him to consult his own advantage should have the effect of removing any lingering objection that may be felt to legislation of a more energetic kind than has hitherto been tried. We shall not be really impeding trade by insisting on its being carried on in a fashion consistent with the health of the community. Here and there, no doubt, particular traders may be inconvenienced for a time; but this will be simply because they have not kept pace with the progress of invention, and have preferred to work as they have been accustomed to work, instead of as science tells them they ought to work. It will hardly be contended that the health of the community ought to be sacrificed, not merely to the interests of traders, but to the interests of traders who do not know their own business.

There is one remark which it is important to make in connexion with this subject at this particular juncture. The new Government will have large arrears to make up in the direction of sanitary legislation, and it is idle to hope that this can be done if the Minister who is charged

with the preparation and conduct of such legislation is not in the Cabinet. The Ministerial programme for each Session is a selection from many competing measures. Each department of the Government contributes, or may contribute, its share; but it is obvious that this share is likely to be larger, and to have a better place given it, when its chief can defend his own Bills in Cabinet Councils than when he is left to get such help as he can from more fortunately situated Ministers. There are advantages, no doubt, in a small Cabinet over a large one; but the question whether the President of the Local Government shall be a Cabinet Minister has nothing to do with the number of the Cabinet. There can be no reason, for example, why the postal service, which furnishes next to no work for legislation, should be represented by a Cabinet Minister, while the department concerned with the constantly growing needs of public health and Poor-law administration should be represented by a Minister not in the Cabinet. The Local Government Board has grown by degrees to cover much of the ground which is covered in foreign countries by the Ministry of the Interior, and except in titular rank it is now of at least equal importance with the Home Office. As such its chief ought to be included in the Cabinet, whether the offices which share that dignity among them are fifteen or twelve.

THE NEW RENAISSANCE.

IN the short and very imperfectly reported address which he delivered at the close of M. Renan's last lecture, Dr. Martineau drew out what he conceived to be the moral of the whole course more pointedly than the lecturer had cared to do himself. He considered that, as in the early Christian ages, Paganism—or what he preferred to call Hellenism—and Atheism were apparently engaged in a death struggle for religious supremacy in the Roman Empire, which however resulted in the triumph of a third form of belief ignored or trampled on by both alike, so in our own day, when the future of religion seems to lie between the rival forces of Christianity and Agnosticism, a third solution of the problem might eventually be found; and his hearers were left to infer that this *tertium quid* would be a purified and enlightened Theism. Whatever may be thought of the analogy suggested between the traditional Paganism of the Empire and the traditional Christianity of to-day, or of the proposed Church of the Future, Dr. Martineau had good reason for tracing in the present unsettled and fluctuating condition of religious thought something analogous to the restless temper of the age when a corrupt and exploded Paganism was gradually succumbing to the nascent faith of the sect that was everywhere spoken against. He might indeed have gone further, and shown how one of the most curious among the moral and intellectual phenomena of our own day is a kind of spurious revival of "Hellenism," recalling in its darker rather than its brighter features the Renaissance of the fifteenth century. But that Renaissance did not end in the common absorption of the Hellenic and Christian elements into some newer, and presumably nobler, phase of creed or culture, but in the great schism of the sixteenth century, and the striking revival of spiritual life, under somewhat different forms, which followed it, in both divisions of Western Christendom. We shall not essay prediction, but no fairly intelligent observer can have failed to notice that peculiar classical or Pagan revival of our own day which is a present and a patent fact, revealing itself at once in art, in literature, and in social life. A recent writer has not inaptly described it as "the reappearance of a passionate love for, and a desire to rest in and thoroughly sympathize with, mere nature, accompanied by a more or less complete and sympathetic rejection of the supernatural, its aspirations, its consolations, and its terrors." One of the leading prophets of the new evangel, of whose high classic and literary culture we desire to speak with all respect, Mr. J. A. Symonds, does not widely differ from this external estimate, when he reminds us (to the discredit of the former) that "modern [*i.e.* Christian] morality has hitherto been theological, and has implied the will of a Divine Governor," whereas "Greek morality was radically scientific; the belief on which it eventually rested was a belief in φύσις, in the order of the universe"; and accordingly, while the motto of the one system is contained in St. Paul's words, "To me to live is Christ, and to die is gain," the other may be summed up in Göthe's well-known lines, "Im Ganzen, Guten, Schönen resolut zu leben." Göthe may indeed be fairly taken as the typical representative or precursor of this revived Hellenism. It is recorded of him that "repugnance to the supernatural was an inherent part of his mind"; and therefore on the approach of death "he only calculated the chances that might still remain to him of life and enjoyment, and the means he might employ for increasing them, among the foremost of which he placed care in keeping at a distance all gloomy thoughts," and when the end was close at hand his last words were, "Open the shutters that more light may come into the room." Conspicuous in our own day among the literary exponents, in prose or verse, of this Pagan or naturalistic reaction, are writers like Mr. Pater, Mr. Symonds, and Mr. Swinburne, the latter of whom strikes the keynote of the movement in such poems as "Hymn to Proserpine" and "Our Lady of Pain," while we recognise in the obscene rhapsodies of Walt Whitman—which are as dull as ditchwater and a good deal dirtier—the shout of its drunken helot. It would be going much too far to say that "all able authors are avowed and aggressive atheists," but it is quite true that "a good many writers make it a condition of ability to exclude the Unknown Factor, . . and in fact to speak from the Agnostic standpoint."

Our last extract is taken from an article on "Debased Hellenism and the New Renaissance" in the April number of the *Church Quarterly Review*—an article containing much interesting matter, though we could wish the writer had drawn out more fully and distinctly than he has done the signs and characteristics of the movement he so earnestly condemns. We quite agree with him that, if the worst vices of Greek civilization and art were repeated, and if possible, exaggerated in Rome, the tendency of some of our own schools, both of literature and art, seems to be to repeat them now, and that a protest is accordingly needed. That this new Renaissance should emulate, as indeed that of the fifteenth century did, the lower and debased rather than the higher moral tone of Greek art and culture, was perhaps inevitable, and is certainly the fact. Those who would revert from belief in a Divine Ruler of the world to belief in Nature—to adopt Mr. Symonds's account of the distinction of the two systems—are not in the same position with thinkers of an earlier age who, like some of the greatest among the old Greek poets and philosophers, were really "looking through nature up to nature's God." It is an echo of the baser, not the better, Hellenism that bids men exchange the "lilies and languors of virtue for the raptures and roses of vice," and calls on the dethroned goddess of lust to "come down and redeem us from virtue." There is moreover a fatal defect inherent in this—as it must be regarded in its ethical aspect—"third-rate imitation of polished ungodliness." Every attempt at the galvanized revival of a defunct form of civilization is necessarily unreal, but the unreality is doubled in this case, for it is not merely an imitation but an imitation of an imitation. We have to measure the descent first from Pericles to Politian, and then from Politian to the modern pretenders who ape his worst extravagances. The *Church Quarterly* reviewer has traced out in the following passage the essential contrast between what he calls the Greek and Gothic—or, as we should prefer to term it, the Christian—philosophy of life, while he denounces the special and superadded vice of our new Renaissance in fastening on the worst side of the Greek ideal:—

> The theory of the nature and uses of Beauty leads, in real truth, to all the questions which make up the standing dispute between Greek and Gothic philosophy of life. We call it Greek and Gothic for brevity's sake: Professor Arnold calls it Greek and Hebraic. Naturalist and Ascetic, or Secular and Monastic, Mediæval and Renaissance, are all names for contradictory views of Life, and of Beauty as one of its pervading and unavoidable phenomena. Nobody knows what it is, but everybody knows that it is there, and nearly all admit that it ought to be there; in other words, that it is good or symbolic of good. Now the Hellenic error about Beauty, seriously exaggerated by the Renaissance for reasons soon to be considered, was to pass from Beauty as symbolic of Good to Beauty as synonymous with Good. Men felt that Virtue and the Good were beautiful, and trusted therefore to their notions of moral beauty as an infallible guide into the eternally true and perfect. The error was excusable, for few or none can escape it who possess vigorous and healthy perceptions and love of Right, yet are not taught the fall, corruption, and frailty of their own souls. If man's taste for all beauty were infallibly correct, it would guide him infallibly to good; which it fails to do. If beauty were inseparable from good, many beautiful people would be much better than they are.
>
> The subtlest, grossest, and most prevailing sin of the vulgar, or modern, Renaissance is the continual issue and reissue of images of beauty fancifully complicated with criminal passion, whether lewd or furious; indeed, it sometimes affects the most skilful work of the time, and rises out of vulgarity into infamy. These combinations are not untrue to nature, in this sense of the words, that something like them does occur in human life; now, as in the fifth century B.C. But they were not the ideals of that century.

It has been already shown that any attempt among ourselves to revive "the delighted animalism of Greek life" is a very different thing, both morally and intellectually, from what the pursuit of their cherished ideal was to those old Athenians who had never known or rejected any better and purer faith. But that is not all. We have learnt from boyhood to gaze in something like a rapture of admiration on that wonderful product of human genius, the Athens of Pericles and Pheidias and Socrates, of those unrivalled orators and poets who being dead yet speak, and whose glowing words have rung music in the ears of some seventy generations of mankind. And our admiration is a perfectly natural one; the spectacle is unique, for history has not such another marvel to record. As a recent poet put it:—

> Every thought of all their thinking swayed the world for good or ill,
> Every pulse of all their life-blood beats across the ages still.

But then we must remember that there was also a darker side to the picture, from which, as Professor Jowett—no prejudiced or unfriendly critic—observes, "we should have turned away with loathing and detestation." And that darker side—not of course in its naked deformity, which would be felt to be intolerable—is what some of our classical revivalists, like their predecessors four centuries ago, seem constrained or determined to unveil.

The writer in the *Church Quarterly* rightly specifies two prominent causes of the moral decline of Athens, the disorder of sexual relations and slavery. The critical significance of this last

point is rather apt to be overlooked. It really divides the Greek from every variety of modern life by an impassable gulf, and renders all social or political analogies to a great extent nugatory or misleading. When we recollect that all mechanical labour, whatever was esteemed *βάναυσον*, or unfit for a gentleman, was devolved on a helot class immensely outnumbering the little community of free citizens, it becomes at once evident that the Athenian democracy in its most democratic days was, as compared with any form of political life we are familiar with, in one sense, a close and oppressive aristocracy. On the moral degradation of Greek, and still more of later Roman society, to which this absolute domination over a subject class offered such fatal facilities we need not dwell here. Nor was that by any means the only cause of those "evil relations between the sexes" to which the reviewer refers. On one part of the subject it is difficult for an English writer to speak in detail. It has been treated with great tact and discrimination, both in its darker and its nobler aspects—for he shows that it had a nobler side—by Mr. Mahaffy in his *Social Life in Greece*. But we may observe here that it has a direct bearing on one prominent contrast of Christian and classical art. As Winckelmann remarked, "the supreme beauty of Greek art is rather male than female," and sculpture is as far superior to painting in the capacity of expressing masculine vigour and beauty as painting is superior to sculpture in the expression of feminine grace. This is undoubtedly one reason why sculpture has always been regarded as distinctively Pagan, and painting as distinctively Christian, the Pagan instinct delighting rather to glorify the masculine and the Christian instinct the feminine qualities, both moral and physical. Here again our modern Renaissance naturally manifests its unmistakable preference for the Pagan or Hellenic as distinguished from the specifically Christian type of excellence. It is not of course the recognition of masculine virtues, which must have their place and value under every system, but the depreciation—amounting both in ancient Greece and Rome almost to simple contempt—of the feminine type, which is in fault. This one-sided conception of excellence culminated philosophically in the hard and pitiless Stoic ideal, while it lent itself no less readily to the popular canonization of Harmodius and Aristogeiton. And there are not wanting ominous signs of a tendency in the bastard Renaissance of our own day to reproduce the twin characteristics so inseparably united under that old civilization which is its prototype—reckless cruelty and unbridled license. Both forms of selfishness, for they have a common root, were abundantly exemplified in the literature and the life of the Italian Hellenists of the fifteenth century; both have found at least literary expression in the "debased Hellenism" of our own. It might not even be a difficult, however ungracious, task to point to ugly revelations which suggest that in some quarters these neo-Pagan aspirations are beginning already to be translated into act. But we must content ourselves with having struck a note of warning, not, as the *Church Quarterly* writer justly intimates, at all before it was required.

THE NEXT MORNING.

THERE is a very well-known and not over agreeable set of feelings and reflections to which tradition has assigned the expressive, if illogical, period of "next morning." This hour would appear to have already dawned for a good many persons in this realm of England at different times during the last week or ten days. It is about that time since the people arose in their majesty and pronounced—it is not very clear what in the positive sense, but, in the negative—a tolerably decided disapproval of the Government of the country. It would now appear that, after arising, some at least of the people have sat down again, and have gone through the less majestic but inevitable process of reflection. The reflection does not seem to have been in all cases satisfactory. Since Sir Wilfrid Lawson, borrowing apparently the formula of that state of life which is supposed to be his special horror, declared that "he never felt so jolly in his life," a change appears to have come over the spirit of the Radical dream. For the leaders there is the unpleasant fact of the laws of arithmetic which make it inevitable that, in a party possessing superior persons enough for three Governments, two-thirds at least must be disappointed. For those who are anxious and troubled about the future there are little qualms and shiverings as to the result of the last leap in the dark. But for a good many more people there appear to be uncomfortable feelings about the past. They are reviewing their own conduct, not invariably with satisfaction; it would even seem that they are in some cases reviewing the whole result of the election with a similar feeling.

First and foremost—leading, in fact, in the commonest of canters—comes the delightful incident of Mr. Samuel Morley and the *Record*. Mr. Morley, who is one of the best of men, and one of the wealthiest of Nonconformists, appears, like many of his fellows, to have gone into the late contest under a banner with the simple device upon it, "There is one God, and Mr. Gladstone is his prophet." Even this simple device, however, was too complicated for Mr. Bradlaugh, the Radical candidate for Northampton, and there were searchings of heart among the electors of that borough in consequence. Ingenious persons therefore procured from Mr. Morley a kind of certificate for Mr. Bradlaugh, and with that certificate the secularist lecturer went in and won. There were, however, admirers of Mr. Morley who could not reconcile this conduct with their ideas of the duties of a religious man, and more searchings of heart occurred. Thereupon Mr. Morley wrote to the *Record* an epistle which, we should imagine, every member of the outgoing Government will have framed and glazed as an heirloom, by way of explanation or sample of the causes which led to their downfall. In this epistle Mr. Morley states that he received a letter asking him to join Mr. Adam in warranting Mr. Bradlaugh. "In the hurry of the moment," it seems, Mr. Morley naturally overlooked his religious principles and telegraphed an affirmative. However, he "deeply regrets" the step he took, which was the work of a moment. After all, he did not write the letter or the telegram himself, which seems to be some comfort to his conscience. It will be observed that not only are Mr. Morley's religious principles of such a conveniently unobtrusive character that he can forget all about them in the hurry of the moment, but his repentance is so judiciously tardy that it does not arise till after the object of his trespass is secured. The earlier part of his proceedings would seem to have been indicated by a misremembrance, in the hurry of the moment, of a well-known text of Scripture. Mr. Morley's new reading is, "Me ye have always with you, but an opportunity of defeating Lord Beaconsfield ye have not always." The delay of the expression of repentance was doubtless due to a reflection that, as the sin was committed, the solace might be at least made secure. Mr. Morley's "next morning" appears to be susceptible of indefinite postponement to suit his own convenience, which is seldom the case with this bad quarter of an hour. However, we have not the slightest doubt that his repentance is very sincere indeed, and that the spectacle of Mr. Bradlaugh sitting on the same benches with himself will frequently afflict him. Perhaps his director (have they directors in Mr. Morley's branch of Nonconformity?) ordered him to refrain from rescinding the famous telegram in order that this refined penalty might be exacted. Only thus can we account satisfactorily for the display of a conscience which unites a remarkable tenderness with a still more remarkable elasticity. It is at least fortunate that Mr. Morley did not take a hint from Mr. Lowe, and say that the election of Mr. Bradlaugh having clearly shown the sentiments of the nation as to Theism, he abandons his own antiquated preferences and discards the "unnecessary hypothesis." At present the scandal which such a statement would have given is avoided, and a pleasing diversity is introduced into the spectacle of the effects of politics on morality. After all, Mr. Morley cannot be charged with indifference to the interests of religion as he understands the word. In a speech at Bristol, where he repeated his peccavi with some modification, he is reported to have observed with joy that "now the census would not be tampered with." In other words, there may be a few atheists in Parliament, but the poverty of the Nonconformist land will not be spied out by an inconvenient system of numeration. For the wise man there are always compensations.

Another interesting patient who is troubled with qualms is Mr. T. E. Page, of the Charterhouse. One day last week Mr. Chamberlain wrote to the *Times*, with his usual urbane readiness in offering instruction to his fellow-creatures, informing the world that the Liberal majority was the work of the despised and vilified Caucus, in which, by the way, there is no doubt that he is right to some extent. The claim, however, troubled Mr. Page very much. Mr. Page had been "indulging in what he thought a reasonable exultation in a distinguished victory." Whether it might not be well for persons in the peculiar position of schoolmasters to keep their political opinions rather more secret than this is a question upon which we shall not enter. The point of interest is the fact of Mr. Page's modest "exultation" and the cruel check which Mr. Chamberlain's douche produced thereon. Mr. Page thinks that several other Liberals besides himself ought to be "sobered" by this explanation of the "distinguished victory." There is, it seems, "a dictatorial ring" about Mr. Chamberlain's letter, which, to use a picturesque French phrase, "warms the ears" of Mr. Page. To this plaintive expression of discomfort Mr. Chamberlain himself replied not, but Mr. George Brodrick, of all persons, came to the rescue. Mr. Brodrick is nearly as interesting an instance of conversion as Mr. Lowe, for it is not very long ago that he protested, in what most people thought a very manly and creditable way, against this identical caucus system. But several things have happened since then, and Mr. Brodrick is a convertite, though with some reserves. Unfortunately, however, Mr. Page seems to be of more stubborn temper, and he replied on Wednesday last with an unanswerable exposure of the drawbacks of the Birmingham system. The country is very much obliged to him for it. But is it not slightly innocent of Mr. Page to have wrapped himself up in his "reasonable exultation" so closely that nothing short of the rude hand and dictatorial voice of Mr. Chamberlain could "strip it off him"? Surely he might have known—it was plain enough to other people, if not to him—for whom and for what he was voting or praying. If such amiable persons could not see (especially with the light of Army Discipline Bills, &c.) Mr. Chamberlain and the reign of caucus in the background behind Mr. Gladstone and the reign of righteousness, it was certainly not for want of being warned. They are George Dandins, who "would have it" very decidedly, though they do not quite seem to possess the philosophical acquiescence which distinguished their spiritual ancestor. It must be a savagely embittered Tory, or a moderate man of a most unamiably cynical temper, who can refuse a tear to poor Mr. Page, with his "reasonable exultation" all dashed by Mr. Chamberlain's explanations, his laugh of sober triumph transferred to the wrong side of his mouth, and his pen

sadly employed in constructing unanswerable arguments against the tyranny to which, forewarned, but not choosing to take the warning, he has just given his vote and interest. Could not the sixth form at Charterhouse elaborate a set of versions of the fable of the Man, the Horse, and the Stag for the comfort and instruction of their dejected instructor?

Mr. Morley consoling himself for having forgotten his God in the hurry of the moment by the thought that the Nonconformists will not be numbered, and Mr. Page protesting, with belated logic, against the Birmingham dictator, are perhaps the chief and most picturesque wearers of sackcloth and ashes just now; but they are by no means the only ones who have brought the ashes and the sackcloth into the public ways. The open proclamation of the fact that Wales has gone "solid" or almost so for the Opposition in consequence of the spiritual tyranny of the Nonconformist ministers seems to have had nearly the same effect on the nerves of some Welsh Liberals as Mr. Chamberlain's epistle has had on those of Mr. Page. Mr. Osborne Morgan, who ought to know, attributes the result solely and simply to sectarian feeling. We do not know whether, when Mr. Osborne Morgan made this statement, he had seen an exceedingly instructive document published by the *Liverpool Courier*. In this circular, which is worthy of preservation as a *pièce justificative* for the history of the election of 1880, the following phrases, with others which we decline to quote, occur:—"I am now going to sign for or against that liberty which has been purchased for me by the blood of the martyrs and the lives of my fathers"; "in obedience to my God I do with my hand set my X on the side of Rendel and liberty," &c. &c. Beyond all doubt "A Welsh Elector" had not seen this choice specimen of Nonconformist electioneering, though, if he had, it might account for the asperity with which he contradicted in the *Times* Mr. Osborne Morgan's assertion. For him, as for Mr. Page, the election was a triumph of "Liberal policy and statesmanship." Perhaps that Welsh Elector, unlike Mr. Page, is still cosily enveloped in his delusion; but if he has read his newspapers like an enlightened person we fear that he too will be undeceived. It is cheering in the midst of all this discomfort—and we are bound to add of all this imbecility, it being perfectly clear that the good people who make the complaints and counter-assertions voted without a ghost of an idea of the whole question before them—to reflect that there is one bright spot. It does not appear that Mr. Gladstone is at all disturbed in his mind. In his remarks to correspondents and deputations and Congregationalist ministers, whom he compliments—with great reason, if we may believe the *Liverpool Courier*—on their valuable aid, a serene satisfaction is alone visible. For Mr. Gladstone all things have worked together for good. The ingenious persons who voted for Rendel and liberty in obedience to their God, and those who, like Pierre Leroux's editor, agreed, in voting for Bradlaugh, to regard *la question de Dieu* as very much inferior in actuality to the question of turning out Lord Beaconsfield; the long-headed wirepullers of the Caucus, and their somewhat short-headed friends who played into the hands of the Caucus while dreading and detesting it, all assume the appearance of defenders of truth and freedom. The essence of the philosopher, it is said, is to be able to see unity underlying diversity. What a philosopher Mr. Gladstone must be, and how wanting in philosophy are the foolish persons who are now feeling as if it were "next morning."

BRAINS AND SCHOOLS.

A CORRESPONDENCE of unusual interest has been going on for a week or two past in the columns of the *Times*. Even at this exceptionally exciting moment, the letters on brain exhaustion and intellectual pressure have been eagerly read. One witness has followed another, until at length there is a really formidable array of testimony to the existence of a grave and increasing evil. It is maintained alike by parents and doctors, by school teachers and school managers, that the standard of girls' education, whether in secondary or in elementary schools, has been placed unduly high, and the facts brought forward in support of this position seem to be beyond dispute. There are several reasons why the danger should be greater for girls than it is for boys. In the first place, the brain power in girls is developed earlier and is stimulated by a greater degree of nervous energy. A very eminent physician has said that women are now aiming at doing everything that men do, and that to each thing that they aim at they bring twice the amount of eagerness that men bring. Unfortunately, in spite of all that the advocates of the equality of the sexes can say, women are not the equals of men as regards physical strength; and when they try to do the same amount of work, and throw a double mental strain into the effort, the result will inevitably be seen in one form or another of physical or mental disease. What is true of women as compared with men is still more true of girls as compared with boys. A more precocious growth of brain power naturally leads, unless very great care is taken, to an equally precocious accession of brain exhaustion. In the second place, the education of girls is governed by less rational principles than that of boys. Generations of schoolmasters have pretty well discovered what boys can advantageously do and what they cannot. Good girls' schools are things of yesterday. Everything about them is still in the experimental stage. Enthusiastic head-mistresses are keenly alive to the amount of leeway there is to make up, and they have not yet learnt that an increase of speed which runs the ship upon a rock is only a proof of bad seamanship. A third reason is to be found in the earlier age at which girls' education ordinarily comes to an end. The reputation of a school largely depends on the success of its scholars at Oxford and Cambridge; and, if boys are to do well at the University, they must not be overworked before they go there. If it were more the custom to send girls to Girton, there would be a similar inducement not to use up their mental powers by the time they are eighteen; but, as matrimonial and social customs will for a long time to come fix eighteen as the point at which a young lady's education is, in the great majority of cases, considered to be finished, the force of this particular inducement to caution is not likely to be largely felt. A fourth reason is that public opinion now puts athletic eminence at least on a level with intellectual eminence. The production of brain exhaustion demands a considerable amount of brain work, and in boys' schools the time which is devoted to games makes it difficult for an ordinary boy to work more than is good for him. By and by parents may be as anxious that their daughters should do conspicuously well at lawn tennis as in languages or mathematics; but there are few or none of whom this can as yet be said. The excellence which gains fame for a girls' school is exclusively intellectual excellence.

Mrs. Garrott Anderson tells a story which, if we had not her authority for it, would be hardly credible. "A little girl of eleven," she says, "attending one of the best day schools, was obviously finding it very difficult to overtake her work." Considering what one part only of her work was, it would have been odd if she had not found it hard to overtake. The German lesson she had to prepare out of school hours included the translation of a page of English into German, and of a page of German into English, together with the learning by heart of nine irregular verbs and two pages of phrases. Of course all this was in addition to the child's ordinary work in English and French, and probably the usual accomplishments of music and drawing were not neglected. This was in no sense an exceptional case, at all events in this particular school; for when the child's mother remonstrated with the schoolmistress, all she said was, "Ah, Fräulein is apt to give too long lessons." As Mrs. Garrott Anderson justly says, with a careless mother, the child would have gone on attempting to do this monstrous task; and where children's education is concerned there are as many careless mothers now as ever there were. The only difference is that, whereas formerly they did not care how little a child knew, they now do not care how much a child does. Unfortunately there is little reason to hope that even medical warnings will have much effect. The doctor is sent for when the child is ill and dismissed when the child gets well, and as soon as his back is turned all that he has told the mother is too often forgotten. The child must go to school because it is inconvenient to keep her at home, and while at school she must learn what other children are learning. Otherwise the mother would have to take special trouble in the matter. She would have to ascertain how much work the child was doing and with how much ease or difficulty she seemed to do it. Then she would have to make special arrangements with the schoolmistress, who, especially if the child were clever, would naturally wish to press her on, and all this would very probably have to be done in the teeth of the child's own desire to keep abreast of her companions. A process of this kind involves a good deal more thought and labour than many mothers care to give to their children's health. It is so much easier to say that what is done by all children cannot be very injurious to one, and in this comfortable conviction to allow things to take their course.

The case of elementary schools is somewhat different. There the existence of the evil seems to have been placed beyond dispute, but the principal, at all events the original, sinner is the Education Department. In theory the parents of the children have the same power that the parents of children attending secondary schools have. Even in these days of compulsion a man could hardly be fined for refusing to allow his child to be taught an extra subject. But the relations of such a parent, whether with a School Board or with the managers of a voluntary school, would not be agreeable. The omission of a child to learn an extra subject would mean the loss of the Government grant for a pass in that subject. By this means the income and character of the school would both suffer, and the parent who had presumed to put his child's health before the wishes of the school authorities would be a black sheep in their eyes. The poor seldom care to make themselves objects of dislike to those from whom they hope to derive some benefit. And, apart from this, they are not likely to be more clear-sighted than their betters as regards the cause of a child's ill-health. There is one very good reason, however, why the public should not acquiesce in this state of things in the case of elementary schools. In the case of secondary schools the chief agent in a reform must be the parent, and the parent cannot be made wise by Act of Parliament. In the case of elementary schools the chief agent in the reform must be the Education Department, and it is possible to make the Education Department wise by Act of Parliament. No doubt, if the Fourth Schedule were done away with, energetic school managers might still wish to load the brains of the children with more learning than they can healthily master during the few years they remain at school. But the strength of the motive for this desire would be very much lessened. Theoretical zeal for the diffusion of knowledge is now stimulated by practical zeal for a share in the payments which the possession of that knowledge by the children brings into

the managers. The more extra subjects are taken up, the less will be the sum which the ratepayers or the subscribers will have to find in order to meet the expenses of the school. If the Education Department were to limit its payments to necessary subjects, together with such additional knowledge as could be conveyed in the process of teaching these necessary subjects, this source of temptation would be removed. It may be objected that the quality of elementary education would suffer. If it is true that the health of the children suffers from the labour it costs them to assimilate the present quality of elementary knowledge, this would be no harm. Learning, be it little or much, becomes a dangerous thing when it injures health now and strength hereafter. Apart from this, however, the whole policy of the Education Department in relation to extra subjects needs revision. Education is now largely paid for out of the rates. And in proportion as it is so it becomes a matter for the most careful consideration whether anything ought to be taught as part of the school course, except the bare rudiments. It is not considered expedient to give paupers more than a minimum of physical necessaries, and it ought not to be taken for granted, as it lately has been, that anything more than a corresponding minimum of mental necessaries ought to be supplied under the market value. If parents wish their children to learn more than this minimum, they should have every opportunity of getting what they desire at the lowest remunerative rate. But it does not follow that they should have an opportunity of getting what they desire at a rate which is only made remunerative by being supplemented by the contributions of ratepayers scarcely richer than themselves. The whole machinery of the Parliamentary grant demands inquiry alike in the interest of the children's health and of the taxpayers' pockets.

THE NEW MUSEUM AT BOOLAK.

THE Ministry of Nubar Pasha, Sir Rivers Wilson, and M. de Blignières left to Egypt, at their premature downfall, one enduring monument of their brief tenure of power. A moderate sum was set apart for the rebuilding of the Museum of Egyptian Antiquities which M. Mariette has gathered at Boolak. During a great part of the present season the public has not been admitted within its doors, while re-arrangement was going on, and even now the rooms are not all complete. But the alterations and improvements are so great that it is only surprising that the Museum should be open at all before next winter. The miserable shed which was all that Ismail Pasha could find for one of the most magnificent collections in the world was water-tight neither above nor below. It was accessible to anything like a high Nile, and a single night's rain was sufficient to break through the roof. The Khedive, it was said, had done munificently. He had given a palace for the Museum. And unfortunately, while he yet reigned, it was impossible to grumble. It was hoped that he might be induced to give a better building, and more than one well-informed person asserted that he fully intended removing everything to his favourite residence at Gheezeh. This would have taken the Museum out of the reach of ordinary students, and would have been in every way a misfortune, especially as it would have placed the collection more in the power of the Khedive, who, as is well known, carried off other collections belonging to the State, including a famous cabinet of coins. For these, no doubt, the new *régime* can make him pay; but the Boolak collections are invaluable. It would be easy to name half a dozen objects any one of which would be worth no particular sum, but only as much as the wealthiest purchaser could afford to give. The Khedive knew this well, and many who grumbled that M. de Blignières had decided to rebuild the Museum at Boolak were silenced when they heard a whisper of the alternative. It was certainly allowed that the Museum must remain by the river's bank. The great Sphinxes, the colossal Rameses, the red granite coffins, could not be carried through the streets without risk; indeed—for new Egypt does not seem to have the mechanical appliances of five thousand years ago—it was doubtful if they could be carried at all. Moreover, there were certain fragile objects, and those among the most precious, which could not be moved without the greatest danger, almost the certainty, of irreparable injury. On the whole, then, M. de Blignières seems to have been well advised to improve the existing building, if it could be called a building, and at least to transform it from a shed into a permanent structure, at the same time raising the level, and making provision against inundation which should obviate the danger of damp reaching the coloured objects. Boolak is out of the way, but Gheezeh would have been twice as far from Cairo; and at all events it is not so far as South Kensington is from London.

When the Museum was closed and the chief curiosities packed up and stored away, the floors and roofs were wholly removed. The stone walls, where there were any, were strengthened, a deep layer of waterproof concrete was laid down everywhere, and the level of the surrounding garden raised nearly three feet above the highest recorded high-water mark. In December all Cairo was startled to hear that the case containing the regal scarabs—that is, the beads which were inscribed with cartouches or ovals of old kings—had been stolen. This unfortunately proved to be but too true. Nor has any portion of the plunder been recovered, though inquisitorial and, indeed, to an Englishman's ideas, tyrannical proceedings were taken against not only suspected persons, but even against Arabs who had at any time sold such *anteekas* to tourists. It is, however, satisfactory to know that the rarer examples, such as one belonging to the time of the Third Dynasty, and another representing Osiris as king of Egypt, which may be of any age, were safe; and also that duplicates of all the ordinary examples were in another case. About the middle of February a favoured few were admitted to the Museum, and after the beginning of March matters were so far forward that little or no restriction was placed on the admission of the public, though only five of the seven or eight rooms were yet open.

The greatest improvement is to be remarked in the assembling of all, or almost all, the objects belonging to the earliest period in one large room, hitherto nearly useless from its proximity to the bank of the river and its consequent exposure almost annually to the influence of the inundation. Here we are now able to compare in one field of vision the famous wooden man, the pair of statues from Maydoom, and the magnificent diorite sitting figure of Chafra, the Pharaoh who built the second pyramid of Gheezeh. Near him is the sarcophagus of Shoofoo-Ankh, who may be considered the architect of the Great Pyramid. Close by are two other red granite coffins, of magnificent proportions, and engraved with hieroglyphs in the large style which distinguished the art of that remote period. They formerly stood in the open court in front of the Museum, and it is satisfactory to note their removal to a place of shelter. Both once contained the bodies of princes, the sons of kings, and one cannot repress a feeling of regret that, after such elaborate and costly sepulture, they should have been cast out and left to the tender mercies of scarab-seeking Arabs. Although this chamber contains the oldest monuments known to exist, the earliest period represented in it is that of Seneferoo, who is generally looked upon as the last king of the Third Dynasty. His son, Rahotep, is described as his heir; but he must have died young, or at least before his father. It is curious to find, even then, all our modern systems of honorary distinction in full use. The prince bore the titles of chief priest of a temple, chief overseer of works, chief of the arsenal, superintendent of canals, chief steward, general of bowmen, and other offices which are described in a language and style so archaic, or perhaps we should say so different from the later writing of the inhabitants of the land, that they are not intelligible. Close behind the statues of the prince and his wife are two paintings in a kind of fresco, or, as M. Mariette calls it, "gouache," also from the now dilapidated tombs of Maydoom; and near them is a monument chiefly remarkable for containing among the inscriptions the name of a very ancient king. It does not seem possible that Shery was actually living under the Second Dynasty; but he is described as priest of the divinity of Send, whose name in its royal oval answers to that of Senda, the thirteenth king after Menes. He is also priest of another king's divine worship, a king Per-heb-sen, who is only known by his mention on this important monument. Shery may have lived many generations later than the Pharaohs in whose honour he performed his sacerdotal functions, and, as M. Mariette observes, the memory of some of these early kings was kept alive down to the latest period, and priests of the cult of Papi, Menkaoora, Shoofoo, Seneferoo, and even Menes, are mentioned under the Ptolemies. Circumstances like these give a continuity to Egyptian history which it would otherwise want. Religious endowments were respected in the changes and chances of so many millenniums, and the restoration of estates to the temples is constantly recorded as a meritorious action in all periods of Egyptian history. The greatest revival of the kind took place under the Twenty-sixth Dynasty. Old titles were revived, even though they had become unintelligible. The old form of the hieroglyphs was copied. The arts of carving and painting followed the style, not of the great works of the Nineteenth Dynasty, under Rameses and his successors, but went back to the early type of the pyramid builders, and remind the modern student of the Gothic revival of our own time. But the rule of the Psamthiks and Nekaoos soon came to an end. The attempt to go back to the good style of the ancients gave way under Cambyses and Darius, and the Ptolemies made no advance; the effect of Greek influence on Egyptian art was, strange to say, to give it a stiffness greater than it had before; symmetry was studied before fitness, and even the portraits of kings and the figures of the gods became more architectural features in well-balanced designs.

Many examples both of the revival and the decay of Egyptian art may be seen in the Museum. Among them are two interesting busts, both found at Karnac. The larger represents a queen's head, the crown and part of the throat being broken away, leaving only the face perfect. It is a singularly lifelike face. The nose is, to say the least, *retroussé*; the mouth wears a pleasant smile. The white alabaster of which it is made adds to the effect of the bust, and produces an extraordinary impression of sweetness, grace, and irregular beauty, combined with a certain idea of power, and at the same time, it must be confessed, of insincerity. This was the great Queen Thya, the wife of Amenhotep III., the king whose statues are the great colossi of the plain of Thebes. She was probably a foreigner, and lowly born, but Amenhotep loved her, and signalized his love by associating her with himself on the throne, and her name with his in countless inscriptions. The adjoining bust, though it is of black granite, and terribly mutilated, bears a singular resemblance to that of the queen. It represents Merenptah, the "Pharaoh of the Exodus." The likeness to Thya may perhaps be accounted for

If we remember that Rameses II., the father of Merenptah, was descended through his mother from the old royal line, and is said in some inscriptions to have been king from his birth. It is interesting thus to trace a family likeness in people who were as long before the Christian era as we are after it. Later than Merenptah there is little or no sculpture of the same excellence till we come to the time of the Twenty-sixth Dynasty, as we have remarked; but of that period the Museum possesses some statuettes of an excellence seldom surpassed even under the early monarchy. They seem all four to have been executed by the same hand, and are full of a delicacy and grace very unusual; but the straining after what must even then have been an archaic style is very apparent. The central figure represents Psamthik, a priest of Osiris and Athor, standing immediately before, and, so to speak, under the chin of a beautiful cow, who wears the moon between her delicately curved horns, and seems to protect and guide her worshipper. At either sides are seated figures of Osiris and Athor. Near them is a figure of the hippopotamus goddess, sometimes called Thoueris, sometimes simply the Nile, a hideous form, but exquisitely sculptured, and, like all the four, in a hard green stone, perhaps diorite. One cannot but admire their finish, their grace, and their simplicity; but when we compare them with the great diorite figure of Chafra, some two thousand years older, we perceive at once the meaning of such a phrase as dead and living art.

MEN-SERVANTS.

It is an obviously interesting subject for a minute philosopher to inquire why, as a rule, men-servants are less often complained of than their fellows in slavery—the maids. A philosopher of this order, who has recently furnished the *Times* with a study of Jeames, assigns two causes—first, that there are fewer servants of the male sex, which seems a base and rationalistic explanation; secondly, that their misdemeanours press less heavily upon the persons who employ them. A third solution of the problem might be found in the fact that these persons generally know a good less about what are familiarly termed the goings-on of their domestics than the masters and mistresses of humbler establishments. The larger the family, in the wide sense, the less chance there is of individual members of it, whether they are on equal terms or on the extremely unequal footing of master and servant, rubbing against one another unpleasantly. Nevertheless there is doubtless good ground for the theory that John is not a more perfect being than Mary, and that in some respects he is even less perfect. The more commonplace woes upon which the *Times* essayist has touched are indeed common to the two. A singular voracity, unequalled in the personal experience of any other class of human beings except Australian aborigines and young gentlemen in training, a faculty for not dwelling together in unity which might move the ghost of Dr. Watts to the composition of another immortal song on the delights of dogs, and an undue tendency to the consumption of alcoholic liquors, may be at once confessed and deplored in both. But the acute observer will reflect that, as the masculine gender is more worthy than the feminine, so the unworthiness of the masculine is greater in inconvenient results, if not in moral turpitude. A drunken virago of five foot one is morally and sentimentally a more unpleasant object than a drunken male being of six foot two; but she strikes less awe into the timorous beholder. The philosopher whose essay serves us as a text was once only preserved by the opportune presence of two undergraduates of the University of Oxford from the unpleasantness of being defied by such a monster. Now it is clear that even the extension of the lodging-house system and of that of unattached students will not enable the University to supply two well-grown undergraduates as a personal bodyguard to every man who keeps a man-servant; yet without such a bodyguard the master may be given over as a prey unto his man, and the police, still to quote our authority, will refuse their services except as impartial witnesses to "see fair."

It has often been complained that, in such matters as this, the lions are not allowed their fair share of the painting. This is not the case in the present instance. Mr. Yellowplush has evidently long ceased to be a rare bird in the servants' hall, though it must be admitted that he does not seem to have communicated to his companions or bequeathed to his successors the charm of his remarkable orthography. Two of the attacked—"R. H. M." and Arthur Mills—have entered the lists against the *Times*' essayist, and have endeavoured to put the other side of the question. "R. H. M." is a very reasonable sort of man, and urges what he has to say with good enough sense and in good enough English. The only thing comic about his letter is the curious bit of ambition with which it concludes. Servants, according to "R. H. M.," are badly off for a future; their vocation is not a career open to talent. "The mechanic," he says, "is often seen rising to a high position, and even becoming a leader or well-known supporter of a great national movement, while the man-servant rarely rises to be more than a publican and lodging-house keeper." If it will comfort "R. H. M.," we can tell him that we recently read (it is true it was in a novel) of a man-servant who became a literary critic of great fame and ruthless severity. Otherwise it must be confessed that the ranks of the world's greatest men have not been largely recruited from the household brigade. We had always ourselves set this down to the wise indifference of the wise; but, according to "R. H. M.," it is only the hardness of fate. It is a little surprising, however, that any one should pant for the position of a risen mechanic leading, or notoriously following, national movements, and should look down upon the sweet security of the bar. But perhaps "R. H. M." has in his mind the troublesome persons who at one time permissively prohibit and at another locally opt, and who have certainly succeeded in planting some thorns in the cushion of Boniface. On the whole, we incline to think that "R. H. M." secretly wishes for a butler franchise. Mr. Arthur Mills is a much more eccentric person. The thesis he has set himself to prove is that the position of men-servants is a very undesirable position; and, as far as assertions go, he certainly makes this out. He represents as a common fate of his ill-used fellows that he falls into "the pitiable condition of finding himself under the control of a master or mistress whose delight is in outraging his sense of self-respect, placing him under the eye of suspicion, debarring him from all ideas of independence, extinguishing hope, and disheartening all his efforts to give satisfaction." Certainly Mrs. Brownrigg was a merciful employer compared to this dreadful pair. And what is the consequence? Mr. A. Mills assures us that it creates, among other things, "a loss of appetite and a revulsion from food." Now, without pressing too strongly on a delicate subject, once already referred to, we believe that the majority of housekeepers will corroborate us when we say that this result is one of by no means common occurrence. *Argal* the causes which, according to Mr. Mills, produce it must be uncommon too, and the master and mistress who are outragers of self-respect and extinguishers of hope, who have a morbid fancy for placing their servant under the eye of suspicion, cannot be quite such common objects of the London streets as Mr. Mill would make out. The accuser, however, has all the confidence of his function. He proceeds to inform us after the fashion of the Early English poets that "the sumptuous surroundings of his employers seem to satiate their hearts with selfishness," from which it naturally follows that they look upon "the man-servant as a machine made to order." The special purpose of this machine is then indicated in terms which (pleading ignorance of the *argot* of the service) we must confess that we do not fully understand. The fiendish employer, it seems, regards the man-servant as "constructed to attain the accomplishment of hunting the banisters for sixteen hours out of the twenty-four." How does one hunt a banister? and does he give good sport? Is he pursued on foot or horseback, and is a *costume de sport* and a *cor de chasse* necessary? It is conceivable that the occupation of hunting the banister for sixteen hours consecutively might become monotonous, but the odd thing is that Mr. Mills complains of the "tyrannical tenacity" with which masters enforce the sport. Surely the banisters even of the most many-staired house would soon be exterminated with such hot work as this. *Ex nostrâ conjecturâ* we propose "haunting" or "mounting" in lieu of hunting. It is true that the really representative butler or footman only mounts the stairs—not the banisters—under protest, but he may safely be said to haunt them, grouping himself with graceful grandeur—Mr. Mills's alliteration is catching—round their lower growth.

Who is to decide this weighty argument? For ourselves we own to a partial leaning, if not to the side of Mr. Mills, at any rate to that of "R.H.M." The Devil's advocate of the *Times* betrays a certain animus, which may be attributed to the discomfiture which he so nearly received from that very large butler. Besides, he is not as fully penetrated with his subject as he might be. He gives as a reason for employing men instead of maids that the latter "cannot be expected to carry up a luncheon or dinner tray for a dozen persons." Now let it be remembered that he is, by his own confession, dealing, not with establishments where many footmen are kept, but with singly manned places. All we can say is that, if he gets a single man to bring up constantly a luncheon or dinner-tray for a dozen people, he is the most ungrateful of employers to grumble. There was once a butler who represented to his mistress—it was in a country house, and somebody had come in to lunch—that he himself and his assistant could not be expected to provide for the wants of twelve people, and that "the children"—*i.e.* the eldest hopes of the house—must be sent upstairs for the occasion. Indeed there can be only two fit uses for such a treasure as a man-servant who will bring up a luncheon or dinner-tray for a dozen people twice a day; the one is that he should be instantly embalmed and put in the place of honour at the new Natural History Museum, the other that he should be pensioned at the nation's cost and implored to bring up the largest possible family of children in his own admirable ways. As against the essayist moreover we should maintain that the most glaring drawback of men-servants is not their immorality, or their drunkenness, or their dishonesty, or their quarrelsomeness, but simply their tendency to do nothing. It is difficult for any thinking person to contemplate a footman in full flower without being convinced of the truth of that footman's evident feeling that his business is simply to exist and be beautiful. You might as well expect the statues or the exotics in the hall which is his habitat to come down and make themselves useful. It is true that the great majority of men-servants have not arrived at this stage, and that the perfect butler, for instance, has passed it. But it is the stage to which all the former tend, and from which the latter has only emerged, as the nineteenth-century English gentleman emerged from his more bedizened eighteenth-century predecessor. The unliveried or only partially liveried footman strives towards it, the disliveried butler has reminiscences of it. In short, the correct

theory of domestic service is that men-servants should be kept for the purpose of living in a vain show, and women-servants for the sake of doing the work necessary to that living. Mr. Mills indicates with sufficient precision the delicate character of the organism which the *Times'* essayist would put to the vilest uses. He has a sense of self-respect—in the matter of coalscuttles. He cannot bear to be placed under the eye of suspicion—in the matter of bottles of wine. Ideas of independence and hope spring eternal in his breast, only to be nipped by the deliberate cruelty of his master and mistress. Is this a thing fit to black human nature's daily boots, to comply with its imperious orders, and, begging Mr. Mills's pardon for the odious phrase, to fetch and carry for it? Clearly not. Of course there are men-servants who are simply worth any money that their master can afford to pay them, who literally lay themselves out to save him trouble and relieve him of the minor worries of life in a way in which maid-servants with the best intentions in the world never think of, and therefore never adopt. To be *prévoyant* is not among the numerous excellences of the fairest of all possible sexes in any rank of life. If anybody can secure a really good man-servant, then he most decidedly secures a good thing. But, on the whole, the probabilities are rather against his securing it, and there is not much doubt as to the reason why. Modern democratic ideas have made domestic service unpopular, and it is not for men, as it is for women, almost the only reputable employment open on a large scale. The consequences of these two simple facts do not need much exposition.

FRENCH PLAYERS ON THEIR ART.

THE increasing importance with which the actor's art is invested has been illustrated in various ways of late, and few more interesting instances of this have been seen than are afforded by two little pamphlets, by M. Coquelin *aîné* and M. Dupont-Vernon respectively, which have just appeared in Paris. True, the theatre has always been more a part of every one's daily life and interest in France than in England; but against this fact may be set others which are referred to by M. Coquelin in his attractive *brochure* called *L'Art et le Comédien*. In the first sentences of this the distinguished actor points out the superstition which he wishes to combat. "For some time past," he writes, "people have talked a good deal about us; discussions have been going on concerning actors and the stage, people have tried to assign us a place apart, whether with regard to art or to society; and have even gone so far as to say that" "nous n'étions que de simples perroquets. . . . Je vais essayer de prouver que le comédien est un artiste et qu'il a son place dans un État au même titre que tous les autres citoyens." What, he continues, is art "si non l'interprétation de la nature, de la vérité, plus ou moins pénétrée d'un certain rayonnement, qui n'altère pas les proportions, mais qui néanmoins accuse le trait ou le colore, met la vie en relief, de manière que notre esprit en soit plus vivement et plus profondément frappé?" "And is not this," M. Coquelin suggests, as it seems to us with perfect truth, "what the comedian does?" The difference he points out is this. The poet's instruments are words, the sculptor's marble or bronze, the painter's his colours, and so on, while the actor is his own key-board, and plays on his own chords. To this, the writer observes, it may be objected that the actor cannot be called an artist, because the thought that he interprets is not his own, and that the word art involves the idea of creation. To the supposed objection he has a complete and fully-developed answer. He begins by quoting letters addressed by various eminent writers to various eminent players, the burden of all which is to the same effect. Voltaire said of Mlle. Clairon's Electra, "Ce n'est pas moi qui ai fait cela, c'est elle; elle a créé son rôle!"; and, passing over many others, we come to a letter from M. Ambroise Thomas to M. Faure, concerning *Hamlet*, in which the composer speaks of "la magnifique *création* de votre rôle."

M. Coquelin observes with truth that, even in interpreting the work of a great genius, a great actor puts into the part which he plays something of his own intellect and of the result of his own laborious studies; and he strengthens his argument that the actor is an artist in the sense which he gives to the word, by pointing to the many second and third-rate plays which owed their success merely to the overmastering genius of Talma, while he takes occasion to refer to the later case of the great Frédérick's success in the part of Robert Macaire. In speaking of this he quotes what the actor himself has left on record concerning his famous invention. The piece in which Robert Macaire first appeared, *L'Auberge des Adrets*, was intended by its authors for a sombre and impressive melodrama. "Ce n'était même plus le mélodrame, usé, démodé, descendant un degré de plus vers l'oubli, où la loi de nature entraine toute chose; c'était son effondrement soudain." In reading over his part again and again, he was at his wits' end what to do with it; then it suddenly struck him that, if the two chief characters, Robert Macaire and Bertrand, were played from a comic point of view, they would be excessively funny. He communicated what he called his "idée bizarre, folle" to Firmin, who was to play Bertrand, and who jumped at the notion. They rehearsed their effects in secret and let no one know till the first night of the piece of the curious improvement on the author's idea which had occurred to Lemaitre, and the immense success of which is matter of history. Two of the authors recognised the value of what Frédérick had done; the third went about clamouring that his piece had been ruined. This was, of course, an unusually striking instance of an actor being at the same time the author of a popular part in a piece not written by himself. A modern parallel to it in some respects may be found in Mr. Sothern's Lord Dundreary. But, as M. Coquelin aptly reminds us, in speaking of Lemaître we must remember that the same actor who invented Robert Macaire was also the interpreter of Ruy Blas, of his performance of which part M. Victor Hugo said that it was not "une représentation, mais une *transfiguration*." M. Coquelin adds, "might not the same word be justly applied to M. Regnier in *La Joie fait Peur*, *Gabrielle*, *L'Aventurière*, or *Romulus*; to M. Delaunay when he plays Fortunio, Perdican, or Horace in *L'Ecole des Femmes*; to M. Got, whether as the Duc Job, Giboyer, or the marvellous Abbé in *Il ne faut jurer de rien*; to M. Dumaine in *Patrie*; to M. Saint-Germain in *Bébé*?" One name which his readers will naturally supply for themselves M. Coquelin has equally naturally omitted.

He goes on, after further remarks of interest on this part of his subject, to speak of Diderot's *Paradoxe sur le Comédien*, and we note with satisfaction that M. Coquelin's views on this matter coincide with those which were expressed some time ago in these columns. "The paradox," he writes, "is truth itself; and I am persuaded that no one can be a great actor who does not hold himself completely in hand, and who cannot express at will emotions which he does not feel, which he never will feel, and which, according to his real nature, he never could feel. This it is which makes our calling an art, and a creative art. The same faculty which enables the dramatic poet to call up from his brain a Tartufe or a Macbeth, although he, the poet, may be the most virtuous of men, enables the actor in his turn to assimilate such a character to himself, to work its secret springs at will, and yet never to lose his own individuality, but to stand as much apart from the feigned personage as a painter does from his canvas." This, which seems to us extremely well put, is illustrated by stories of Talma which correspond more or less closely to those of Garrick laughing and joking at the wing, or making a comic aside to a comrade, during or just after the most passionate passages of *King Lear*; and the writer then goes on to make an appropriate comparison between an actor and a pianoforte player:—"Donc l'acteur ne doit pas être ému. Il n'en a pas besoin, pas plus qu'un pianiste n'a besoin d'être au désespoir pour jouer la marche funèbre de Chopin ou de Beethoven. Il la sait; il ouvre son clavecin, et vous êtes empoigné. Il y a gros à parier, au contraire, que s'il s'abandonnait à quelque douleur personnelle, il la jouerait de travers; et, par analogie, qu'un acteur qui considérerait ses émotions propres autrement que comme des matériaux à utiliser, ou qui ferait absolument siennes les passions de son rôle, serait exposé à s'en tirer assez mal. L'émotion bégaie et sanglote, entrecoupe la voix ou la brise. On ne l'entendrait plus."

The same theory is naturally at the bottom of what M. Coquelin has to say a little later on concerning "naturalness" on the stage; and, in illustration of this, one pregnant sentence may be quoted from the many excellent remarks which he puts forth:—"Vous avez un milieu spécial; il faut vous y approprier." Tones and actions which might be full of meaning and impressiveness in private life will seem feeble and vapid on the stage of a theatre. M. Coquelin's pamphlet is full of interest, and the peroration in which he recurs to the question of the dignity of the actor's art is not without eloquence.

If a portion of M. Coquelin's work is a useful supplement to Diderot's *Paradoxe*, so M. Dupont-Vernon's *L'Art de Bien Dire* is a valuable complement to M. Legouvé's *L'Art de la Lecture*. His instructions are thoroughly reasonable, and he gives his reasons for every one of them. Three things, he says in a preliminary address (the work was originally in the form of a lecture, or lectures, to his pupils), are specially necessary in elocution. First, to analyse carefully the words which have to be spoken; secondly, to find for each sentiment or idea the particular expression which fits it, and to remember that the expression of every idea or sentiment takes form in a series of intonations which could be musically notated; thirdly, to place the tonic or dominant note on the important word in the phrase. This last instruction will show how wide of the mark are people who think that emphasis in French verse is a matter of chance; and this point is most fully illustrated in the body of the lecture by instance after instance chosen with a happy skill and judgment. On the subject of "Nature" in recitation M. Dupont-Vernon quotes from the *Précieuses Ridicules* Cathos asking Mascarille where he will send his piece, and his reply, "To the Hôtel de Bourgogne of course—les autres sont des ignorants, ils récitent comme l'on parle." This shows us, says the writer, the secret of the charm of diction which Molière practised and taught. "*Il récitait comme l'on parle.* Ayons toujours ce précepte devant les yeux." Of course M. Dupont-Vernon explains that this seeming naturalness is the result of science and study; and in this respect his views are at one with those held by M. Coquelin as to the art of acting in general. People who think that this is an easy thing to acquire or to practise cannot do better than study the two little books of which we have written.

ENGLISH PRE-EMINENCE AT SEA.

IN a short Report prefixed to the Annual Statement of the Navigation and Shipping of the United Kingdom for the year 1879, Mr. Giffen brings out very strikingly the marked pre-eminence of this country at sea. In a vague way, no doubt, it is known to the general public that England is superior to other nations as a maritime Power; but how great her superiority is, and how rapidly it is growing, is understood by very few. Nor is this much to be wondered at, when we find the representatives of great shipping ports, themselves men who have been connected all their lives with shipping, deploring in the House of Commons the condition of our mercantile marine. As a matter of fact, however, so far is it from being true that our mercantile marine is depressed that the very reverse is the truth. During 1878 and 1879, as Mr. Giffen points out, when the late bad times were at their worst, there was a large increase in the entries and clearances of shipping at the ports of the United Kingdom; this increase was exclusively in British vessels, there being, indeed, a decrease in foreign entries and clearances; and, moreover, the increase was most marked in steam shipping. Nor is this all. The new tonnage added to the Register in the United Kingdom in every year during the late depression has exceeded 400,000 tons. It is clear, therefore, that, instead of finding it difficult to hold its own, as advocates of reciprocity would wish to persuade us, the British mercantile marine is beating foreign shipping in bad times as well as in good, or, rather, in bad times even more than in good. From 1840 up to 1876 the foreign tonnage entered and cleared at ports in the United Kingdom continued to increase much more slowly than the British tonnage, yet it did increase; but since 1876 it has been steadily decreasing. On the other hand, the British tonnage entered and cleared has gone on continuously increasing. Whereas in 1873, the year of highest inflation, the tonnage of British ships in the British trade was only 66·7 per cent. of the total tonnage employed in the trade, in 1879 it was as much as 71 per cent.; and we may add, to show that this gain of British at the expense of foreign shipping is not accidental, that in 1860 the proportion had been as low as 56·3 per cent. During the past twenty years, therefore, British pre-eminence at sea has been establishing itself on a more and more secure basis. If it be urged that during the late bad times British shipping was employed with little profit to the owners, and drove out foreign shipping merely because there was a larger capital behind it, we point to the new tonnage added to the Register as referred to above. Clearly new vessels would not be built at this rate unless they could be employed profitably. The immense proportion of British ships in the British trade will best be understood when we say that in 1878 the proportion of native tonnage was only 25·7 per cent. in the United States foreign trade; in the French, only 30·1; in the Dutch, only 29·1; in the German, only 37·7; and in the Russian, in 1877, only 8·2. It is further observed by Mr. Giffen that, in addition to the vessels employed in our own trade with other countries, British vessels are largely employed in the trade between the Colonies and certain foreign countries; and in support of this statement he refers to tables prepared in his department for the use of the Colonial Defence Commission. It would be very interesting to have those tables; for, so far as we are aware, no statistics on the subject have yet been published.

We have seen that the British mercantile marine continues to gain ground upon the merchant navies of other countries, and that in our own trade, whether coastwise or with the rest of the world, the British tonnage engaged is to the foreign as 71 to 29, or over 7 to 3. We have seen also that it is largely employed in the trade of foreign countries with one another, and we have glanced incidentally at the fact that its recent growth has been chiefly in steamers. This last is the point of real importance, as it gives us unquestioned preponderance at sea. Even in England the employment of steam at sea advanced slowly. In 1840 the entire steam tonnage of the United Kingdom was only 87,539 tons; ten years later it had not quite doubled, being no more than 167,398 tons; even in 1860 it was no more than 452,352 tons; and it was not till 1870 that it quite equalled the sailing tonnage. In that year our steam merchant navy reached 1,111,375 tons, which, allowing with Mr. Giffen a steam ton to be equal in effectiveness to about four sailing tons, would be very nearly equivalent to 4½ million sailing tons. But in 1870 the sailing fleet of the United Kingdom amounted to 4,506,318 tons. Thus steam took more than thirty years to overtake sails. But during the past nine years the construction of steam vessels has been enormous, while the sailing merchant navy has actually decreased. In 1879 the steam mercantile marine of the United Kingdom amounted to 2,508,102 tons, being an increase of over 125 per cent. in the nine years. But, on the other hand, the sailing fleet stood at only 4,013,187 tons, being a decrease of almost half a million tons in the nine years, or just one-ninth. Reckoning, as before, each steam ton to be equal to four sailing tons, our steam fleet would be now equivalent to 10 million sailing tons, and, adding the sailing vessels, we should get a total of 14 million tons. This, it will be understood, is the tonnage of the United Kingdom alone. But the tonnage of the whole British Empire amounts to 2,733,269 steam tons and 5,729,095 sailing tons, which, computing as before, is equivalent to 16 million sailing tons. The steam merchant navies of foreign countries are small, and consequently the 8,200,000 tons of all kinds which comprise those navies are computed by Mr. Giffen to be equivalent to less than 11½ millions sailing tons. In effectiveness, therefore, it follows that the tonnage of the British Empire is about 58 per cent. of the whole tonnage of the world. In other words, it exceeds that of other maritime nations in the proportion of 58 to 42. Further, the mercantile marine of the United Kingdom alone exceeds those of the countries not comprised in the British Empire by 2½ million tons, or by a tonnage equal to the whole sea-going marine of the United States added to the merchant navy of France. If we inquire in what trades the growth of British shipping is most marked, we find that it in those with the principal European countries and the United States. Thus, in the trade with the United States the clearances of steam shipping during the last four years have increased one million tons, in that with France half a million tons, with Germany and Russia 300,000 tons each, with Italy 320,000 tons. There is also an increase in the trade with the Colonies and British possessions, but it is much smaller than in the other cases mentioned. It is, however, to be borne in mind that the voyage to India, Hong Kong, or Australia is very much longer than to any part of Europe and the Atlantic ports of America, and consequently that a proportionate increase of the shipping employed on those distant voyages may be going on, though it is not so apparent on the face of the returns. The growth of our mercantile marine being, as we have seen above, altogether in steamers, it was to be expected that the size of the ships would increase; and we find that the fact is so. It is true even of sailing ships, the average measurement of which has risen from 202 tons in 1860 to 238 tons last year. But, as was to have been expected, it is in steamers that we find the most marked enlargement. Their average measurement in 1860 was 430 tons; in 1870, 464 tons; and last year, 651 tons. The increase of size in the last nine years is especially remarkable, and points to a great gain in economy, as well as in efficiency. And this increased economy is still further shown in the very slight addition to the number of men and boys employed. Thus, since 1860 the number has risen only from 171,592 to 193,548, or about fourteen per cent. From the point of view of national defence this is not so satisfactory, as it shows that the mercantile marine is becoming less and less a nursery for the Royal Navy. But for purely trading purposes the fact is of the highest importance. If the strength of the crews grew in the same proportion as the shipping, maritime business would suffer from every variation in the labour market.

The advantages derived by the country from its great preponderance at sea are so obvious as hardly to call for remark. If we were involved in war we should have an immense reserve of strength to draw upon in numberless ways. The building yards, which, as we have seen, are kept employed in bad times as well as in good, would be at the disposal of the Government for rapidly increasing its fighting fleet; many of the vessels now employed in trade might be armed and used with effect in various services; and the rest would afford means of conveying troops from and to distant parts of the world, and provisioning armies in the field. It is often said, indeed, that the very magnitude of our commerce is its weakness, since it would fall a prey to cruisers. But there are two sides even to this question. The United Kingdom beats the world in the construction of ships, and consequently hostile *Alabamas*, if fitted out against us, ought to be quickly chased from the seas by vessels infinitely their superiors in speed and power. This, however, is too large a subject for incidental notice. We will only say in general that our resources are intrinsically as available for war as for peace, for attack as for defence, and that it is our own fault if our wealth is not also our strength. In the meanwhile, so long as peace continues, our maritime pre-eminence secures to us the greater part of the carrying trade of the world. England has commercial relations with every part of the earth; with many parts it almost monopolizes the commerce; and in all this vast trade three out of every four tons employed are British, besides a large number of ships employed in other trades. The freights thus earned go towards enabling us to pay for the goods we import from every country, and partly account for the fact that we constantly import more than we export without drawing upon our capital. They also help to explain our command over the money markets of the world. Nor is the effect to be overlooked of the constant appearance of British ships in every port. The perpetual presence of the British flag, and the familiarity thus acquired with British ways, British goods, and British money, predispose the natives to deal with this country. As regards the causes of our pre-eminence, they are to be found partly in the commercial pre-eminence of England, and in her possession of more capital, more skill, and more mechanical appliances than other countries, and partly in the natural aptitudes of her people, but chiefly in the revolution that has been effected during the last twenty years in naval construction. We have seen above how steam has been superseding sails, and how the process has been accelerated during the past nine years. Simultaneously iron has been supplanting wood as the material of shipbuilding; and it is this latter change more particularly which has given us the advantage over all competitors, for iron ships can be built better and more cheaply here than anywhere else in the world. No doubt, also, the unwise legislation of other countries has materially helped us; the United States, for example, forbid their shipowners to buy foreign-built vessels, thus compelling them to compete against us with inferior ships. The result of all these co-operating causes is that we are able to do more work at sea than all our rivals put together,

that our shipowners are getting the carrying trade of the world into their hands, and that, whether for commerce or for war, we have acquired a position which no other nation has ever attained to, and which nothing but senseless negligence or rash and stupid parsimony can seriously endanger.

LEARNING IN THE ARMY.

UNDER the above heading the *Daily News* lately informed its readers that the German Minister of War has exhorted colonels commanding regiments to urge their subalterns to the study of modern languages. This, we are told, is no new thing, for a similar recommendation is issued every year in some form or other, and, moreover, it "does not apply to languages only, but to science, art, and even to accomplishments which, from a military point of view, are generally considered of minor importance—such as musical talent and facility of elocution." We must confess ourselves somewhat at a loss to understand the necessity for official encouragement in the case of the last two items. A musical subaltern, especially if he is in the early stages of the cornopean, is regarded rather as a curse than a blessing by his brother officers; and if there is one profession more than another in which, in our opinion, speechmaking should be discouraged, it is the army. According to the *Daily News*, however, the Germans think differently, though we must say that the way in which these accomplishments are turned to account in the German army strikes us, from a military point of view, as somewhat peculiar. For instance, we read that, "If it were desired to have the military resources of Persia examined, the records would be searched for the names of officers having acquaintance with the Shah's dominions; or, to take a more familiar example, if Louis II. of Bavaria were to visit Berlin, the staff chosen to attend him would probably be selected from amongst officers noted for their great love of music. . . . It is not too much to say that, if the [German] War Office wanted to compose offhand a staff of good fellows for the entertainment of some captive potentate, it could designate at once a batch of officers skilled in comic acting, singing, and endowed with a knack of turning society verses." These are all doubtless valuable military accomplishments, and we are confident that the British taxpayer will agree with us on this point; but the *Daily News* is in error in supposing that they are the exclusive property of German officers. We believe that our own War Office also could find, without much searching, any number of officers of this description, who would devote themselves with zeal and energy to the entertainment of any "captive potentate" who might be sent to England. It would be difficult to imagine a more interesting spectacle than Cetywayo living at free quarters in London, surrounded by a staff of officers specially selected by the Horse Guards for their advanced views on the subject of polygamy, busily engaged in "comic acting, singing," and "turning society verses" for his amusement. The *Daily News*, however, does not confine itself to speculations on a possible future, but points out how in actual experience these accomplishments of the versatile German officers were once utilised. "Indeed something of this kind was effected when Napoleon III. was a prisoner at Wilhelmshohe, for all the officers appointed to attend him spoke French with a fluency that astonished him, whilst one of them had been chosen purposely because he had written a number of treatises on the conquest of Gaul, and was likely to prove companionable to the Imperial author of the *Life of Cæsar*." We have always felt inclined to pity "captive potentates" when they are made, as they often have been, the objects of ostentatious and ridiculous attentions on the part of their conquerors, and we have often thought how bored the poor King of France must have been when the Black Prince insisted on performing the duties of a mess-waiter to him; but the case of Napoleon III. strikes us as the hardest of all. To be defeated, to lose his throne, and be made a prisoner, was bad enough; to be surrounded by officers of his enemy's army detailed for the express purpose of entertaining him with what in his circumstances must have been something very like buffoonery, was worse; but to have one of them constantly reminding him that he had written a conspicuously unsuccessful book was surely the unkindest cut of all.

The moral of our contemporary's lecture may be condensed as follows:—You never know at what moment a "captive potentate" may fall into your hands, therefore have the officers of your army educated in "comic acting, singing, and turning society verses." He then affords us the startling information that "the British army is not managed like the German, and our social system is not like that of our neighbours, so that in some things their example would be of little use to us." So we should imagine, judging by the specimen just given; but let us proceed. We are told that "there are some ledgers at the Berlin War Office in which hundreds of officers are entered as being possessed of special gifts," and, further on, "it may be questioned whether we might not take a leaf out of those ledgers at Berlin. With colonies stretching in every direction, and with necessities constantly recurring for studying countries nearer home, it would be highly desirable that the War Office should know exactly how many of our officers are versed in foreign tongues, and to what extent." Has the writer of this extraordinary effusion never heard of such a thing as a confidential report? Is he aware that such reports are annually made on every officer in the service to the Commander-in-Chief? A form of one of these documents is lying on the table before us; it is War Office Form No. 1,114, and, if examined, will be found to contain all the information that the *Daily News* suggests, and a good deal more. For instance, the following are some of the heads:—Whether the officer was a cadet at the Royal Military College; whether passed through Staff College; whether passed through any other schools of instruction, mentioning certificates obtained; whether acquainted with any and what foreign languages; whether distinguished in the field or noticed in despatches or general orders. There are also headings for battles or campaigns, orders or decorations, service on the staff, whether general or regimental, state of health, fitness for active service, eyesight, horsemanship, reasons for considering the officer fit for his position or for advancement, opinion as to his general abilities, reasons for dissatisfaction (if any) with his conduct, and other similar information. True, we observe with regret the absence of headings for "comic acting, singing," &c.; but surely there is enough in the list we have given to enable the military authorities to form a pretty fair opinion as to each officer's value and attainments. A considerable part of the article we are discussing is based upon the assumption that our officers do not study foreign languages, and that they require encouragement to do so. Again, we would ask, has the writer never seen an Indian Army List? If he merely glances at one, he will find scores and scores of officers distinguished for proficiency in one or more of a list of languages including Hindustani, Persian, Arabian, Oordoo, Tamil, Sanskrit, Burmese, and several other Eastern tongues. Has he never seen a report of one of the annual final examinations at the Staff College? We take up one or two at random, and we find, in addition to the one language which is obligatory on every candidate, a goodly list of others as extra subjects, among which we may mention French, German, Hindustani, Dutch, Russian, Spanish and Italian. The *Daily News*, however, in its sudden linguistic frenzy, would have languages to supersede everything, except of course comic acting and singing; for we read that "numbers of officers of studious mood think they do their duty in devoting themselves to what they term professional studies—mathematics, engineering, and fortification—even though they may have no taste for such pursuits; but even in war-time how many of these find their attainments of any use to them? With the encouragement given to the study of the so-called military sciences, the army will always have enough engineers and draughtsmen, but it can never have too many linguists." We certainly should have thought that the much despised "mathematics, engineering, and fortification" would prove at least as useful as the most attentive study of German to an officer who is about to embark for a war, say, in New Guinea. The *Daily News* is evidently seriously dissatisfied with our present system of military education, for we are told that, "as things go at present, the officers of our army have not incentives enough to study things outside the ordinary military curriculum." We wonder whether the writer has any notion what the ordinary curriculum of the young officer of the present day is like. It is not perhaps very elaborate or very arduous; but still, by the time he has passed his drill, his course of musketry instruction, his gymnastics, his course of garrison instruction—including as it does tactics, military drawing and topography, military law and fortification—and by the time he has attended a possible course at Hythe for musketry, another at Aldershot or elsewhere for signalling, and another at Chatham for field works, he has done pretty well. It is easy enough to suggest that officers ought to know more, and that "a prize in money or a step in promotion" should be given to an officer for every language in which he may become proficient; but we cannot say that we agree with the writer. Good regimental officers are the life and soul of our army, and they are those who make their regiment their home, and who identify themselves with their men, not merely in the barrack or on the parade-ground, but in their sports and recreations, at all times and in all seasons. If officers were to spend all their available time in studying languages and sciences for money or other prizes, they would soon cease to take the smallest interest in their men, and would look upon all duty as a tedious nuisance.

We have had enough and to spare of this servile imitation of foreign models, and the sooner we recognize this fact the better. The whole article we have been discussing is written with the notion that the German officer is better than the British because he studies foreign languages and sciences. We do not admit the superiority; on the contrary, we feel confident that if a dozen of each could be taken at random, the British officers would be found to be better shots, better horsemen, more travelled—and therefore possessing greater knowledge of the world—more self-reliant in emergencies, and withal quite as accomplished. It is certainly surprising that a journal like the *Daily News* should have devoted a whole column to such unmitigated nonsense as we have been describing. The article only adds one more to the numerous proofs already existing of the astounding ignorance on military matters which characterizes the British civilian.

RACING.

WHEN the racing season has begun, even a general election does not prevent men who are fond of the Turf from interesting themselves in their favourite pursuit. During the time that the late electioneering excitement was at its height, heavy

betting on the approaching Derby began for the first time. Indeed the Turf has always been a favourite diversion among politicians, and many Cabinet Ministers have owned studs of racehorses. Racing matters form a convenient neutral topic of conversation in the lobbies of the House of Commons; politicians of opposite principles may agree as to the capability or otherwise of some four-year-old to give a three-year-old 7 lbs. over six furlongs, and statesmen who do not sit on the same side of the House at St. Stephen's may vote for the same measures in the great Turf Parliament at Newmarket. A year ago we called attention to the fact that the enormous sum of 225,000*l.* had been given to be run for at the various race meetings in Great Britain and Ireland, during the preceding season; but this amount was exceeded by more than 8,000*l.* in the season of 1879. On the other hand, the actual amount raced for, including the stakes, was about 10,000*l.* less in 1879 than in 1878. During the two previous years, again, the amount of added money had been increased by something like 30,000*l.* a year, so that although the Turf, in a financial point of view, is holding its own, it cannot be said to have advanced with such prodigious strides in 1879 as in 1878 or 1877. As regards the number of horses that have run during the year there has not been much difference for the last five years, the lowest number within that period which ran in one year having been 2,054 and the highest 2,113. Objectors to two-year-old racing may be glad to hear that the number of horses of that age which took part in races during 1879 was fewer by twenty-nine than that of the previous year. Although the number of racehorses aged five or upwards was higher in 1879 than 1878, it is very noticeable that during the last three years there have not been half as many horses aged five or upwards running in public as there were during a similar period ten years ago. Those who dislike short courses may not be pleased to know that last year a far larger sum of added money was given for races between five and six furlongs in length than for those of any other distance. It was to selling races of five or six furlongs, too, that the largest bulk of money was added. Beyond that distance the money added to selling races diminished at a wonderful ratio, decreasing rapidly from 32,000*l.* at five or six furlongs, to 205*l.* at two miles and upwards.

Breeders have lately had the choice of several fresh horses of promise at the stud. The speedy but uncertain Trappist, by Hermit, with his immensely powerful quarters and his many other good points, although he may not be a very evenly made horse, ought, if judiciously mated, to produce some grand specimens of the English racehorse. How far his own uncertain disposition and that of his sire may be transmitted to his descendants time alone can prove. Then there are the winners of the two last Derbys—namely, Sefton and Sir Bevys. It may be objected that little can be boasted of the stamina of our racehorses when winners of the Derby are put to the stud in twelve months; but it must not be forgotten that in Turf history many winners of great races, from one cause or another, have been sent to the stud at an early age. A Derby winner is of all horses the least likely to pay his way for the future in handicaps, or even weight-for-age races in which the winner of the Derby is penalized; in addition to which there are still remaining some owners who would not like to see their horses which have won the highest honours of the Turf afterwards disgraced by defeat. For breeding purposes, again, it may pay better to put at once to the stud a horse that has won the Derby. There is no loftier prize that he can possibly win, and if his fame should afterwards be tarnished by defeat he may be distrusted for the future by breeders. There are, however, exceptions to every rule, and there can be no doubt that when Sefton had won the Derby he was not nearly so much thought of as when he finally retired from the Turf. After he had won the Blue Riband of racing it was said, and with great apparent reason, that he had not been opposed by a field of the character or quality usually found in the Derby, and some people thought that the whole thing was a fluke. But before Sefton left the Turf he had proved himself to be a horse of unusual merit, and his breeding is good enough to give every hope of his success at the stud. Sir Bevys is undoubtedly a very plain and mean-looking horse, and he ran wretchedly in the St. Leger; but nevertheless he won the Derby, and his victory was achieved on a day when the course was unusually heavy. The probability is that he would have been beaten if the ground had been in its usual state; but for all that it must be allowed that he showed evidences of wonderful stamina, and, judiciously crossed, he may prove of great value at the stud. If, as is sometimes argued, strength and endurance are qualities in which our modern racehorses are somewhat deficient, here is an admirable opportunity of producing them, and a son of Favonius and Hampton's dam cannot be objected to as a coarsely-bred horse, even if his own appearance be not particularly aristocratic. No breeding could be more fashionable than that of Beauclerc, by Rosicrucian out of Bonny Bell, who, after a brilliant two-year-old career, became unsound when undergoing preparation for his three-year-old engagements. It was a pity that he was started for the St. Leger of 1878. Some breeders may mistrust his twisted fore-leg, but we hope that a horse which showed such excellence as a two-year-old will have a good chance given him at the stud.

High among the successful sires last year must be ranked Adventurer, if the amount of money won by their stock is to constitute greatness. His daughter, Wheel of Fortune, alone won more than 13,000*l.*, and few horses have ever gained such a reputation as her's. Bertram was the sire of but one winner last year, but that was the famous two-year-old, Robert the Devil, who won the Rous Memorial Stakes at Goodwood, a race worth over 2,000*l.* Doncaster has sprung into fame as a sire with Bend Or, who as a two-year-old won more than 5,000*l.* without being defeated. Rosicrucian's celebrity was maintained last year by his two-year-old Douranee, who won nine races, worth in all considerably more than 4,000*l.*, although she suffered four defeats. His two-year-old Brotherhood also ran well, winning little less than 3,000*l.* Eighteen horses by Rosicrucian won races during the season. The extraordinary successes of Isonomy, who was probably the best horse in training last season, and the victory of Beaudesert in the Middle Park Plate, were alone sufficient to make a high reputation for Sterling. If not the handsomest of horses, the powerful quarters and many good points of Isonomy ought to satisfy breeders, while his stamina and speed are much to the credit of his sire. It is difficult to compare the horses of one year with those of another, but it is quite possible that we may not in the course of several years have seen a better horse than Isonomy was when at his best last season. Blair Athol had fifteen winners and Hermit sixteen during 1879; but the Palmer and Speculum could boast the longest list of all, twenty of the stock of each of these horses having won races. Favonius and the French horse Flageolet were the sires of the winners of the Derby and the St. Leger. Lord Clifden was still represented by the famous Jannette, Lord Clive, and the useful Roehampton. Early in the season many good judges thought that a filly by Prince Charlie was going to turn out the best three-year-old of the year. This was the splendidly shaped Reconciliation. Although she did not fulfil the extravagant expectations which had been formed of her, she won a couple of thousand pounds in stakes during the summer. Prince Charlie was much more glorified by his two-year-old Prestonpans, which won over three thousand pounds, and was sold for an enormous sum of money as well. Thormanby was the sire of but one winner, but this was the handsome Charibert, who won the Two Thousand, which was worth more than six thousand pounds last year. Charibert afterwards turned out an unsatisfactory horse; but there can be no doubt that he did honour to his sire on the day of the Two Thousand.

The heavy engagements of many horses in training show the vitality of racing. Several two-year-olds have between forty and fifty engagements before them, while many yearlings are already entered for a large number of races, one, we observe, having twenty-two engagements. Considering the proverbial depression of trade and the scarcity of superfluous cash, it is wonderful that racing is so prosperous as it is. During the last couple of seasons there have been fewer horses in the hunting field than usual, but the number of horses that have taken part in races has been scarcely, if at all, affected. In bad times one would naturally expect people to reduce their studs of racehorses; but this has not been done to any appreciable extent. Perhaps no expensive amusement has thriven so well during the late years of depression as the much-abused sport of racing, and it has stood the test far better than have art collections, libraries, yachts, moors, and hunting studs. However dull, too, business may have been during the last two years on the Stock Exchange, there has been too much instead of too little animation in the betting-ring.

Events have happened within the last year and a half which have drawn attention to the rule of racing which renders void a horse's entrance to a race on the death of his original nominator. It is said that within the last few months one gentleman gave 7,000*l.* for a horse which has since been disqualified for the Two Thousand by the death of its nominator; and that another, in order to win the Derby, gave 6,000*l.* for a horse which has been disqualified for a similar reason. Hasty legislation on the Turf, as elsewhere, is highly objectionable, but it appears to us that members of the Jockey Club might find it worth while to reflect at their leisure upon the question whether it might not be desirable that a purchaser of a horse should have the power of getting its nominations transferred into his own name by a formal and official instrument.

REVIEWS.

BURTON'S REIGN OF QUEEN ANNE.*

(*Second Notice.*)

SENSITIVE minds have frequently been distressed by the fact that political necessity, real or supposed, is wont to exercise an overruling influence upon the course of legislation, and that the genesis of measures which have indisputably proved beneficent in their results is at times a less attractive study than those results themselves. The history of the Union between England and Scotland, which appropriately occupies considerable space in Mr. Burton's work, forms a case in point. It is indeed burdened by no such unrighteous reminiscences as those attaching to the history of another Union, achieved about a century later. Mr. Burton is able to appeal to previous investigations of his own, which his predecessor Lord Stanhope has acknowledged to be

* *A History of the Reign of Queen Anne.* By John Hill Burton, D.C.L. Historiographer Royal for Scotland. 3 vols. William Blackwood & Sons. 1880.

satisfactory, as having completely refuted the "odious suspicions of corruption that for a time hung round the transactions of the year 1706. But though neither Lord Banff was bribed by his 11*l.* 2*s.*, nor others by more emphatically persuasive sums, it is well known that another noxious ingredient was not absent from the cement of the Scottish Union. The demeanour of the lesser country had been successful in intimidating the statesmanship of the greater, until, as Mr. Burton says, it was well understood that all resistance to the treaty would be in the former, while at Westminster even the possibility of successful opposition was taken away by a lawyer's device. All practical English politicians, not blinded by Jacobite sympathies, had come to recognize the necessity that Scotland must be held closer if she was to be held at all; it was not love, nor even in the first instance self-interest, that brought the two countries to the embrace in which of old King James I. had hoped to see them locked. The Scottish feeling of bitterness against England, in so far as it was not merely the result of ancient antipathies, was not altogether unreasonable. Mr. Burton shows how rapidly that feeling had grown to the extravagant and almost frenzied height which it had reached by the time of the Act of Security. The Restoration monarchy, which owed so much to Scotland, and not the Protectorate, had hit Scotland hard by its Navigation Act. In the Restoration edition the Act was "shaken free of the defect that gave a share in its beneficence to Scotland"; for it had been "among the Englishman's denunciations of the Protectorate Government that it admitted the impoverished and sordid Scots to a participation in the sources of England's wealth." Then came the tragic Darien blunder, unredeemed by the glorious victory of Zubaccanti, and King William's all but dying message commending the Union as the last and only remedy for the existing relations between the two countries. It would indeed seem that the collapse of the negotiations of 1702 was owing to the apprehension of the English Commissioners that their acquiescence in the Scotch demand for Free-trade would ultimately be disavowed. But that which brought the later negotiations to a more successful issue was no argument or claim of an economical nature. It was, in a word, that Act of Security to which the Queen's Commissioner in the first instance, with a very intelligible instinct, refused to give the royal assent. The Act put into words a sentiment which before long found perhaps as extraordinary a mode of expression as has ever marked the international relations of two States not on the eve of actual warfare. Mr. Burton tells with much spirit and frankness the strange story of the seizure of the *Worcester*, and of the judicial murders which followed. He calls the former, "if we look on it in its abstract nature . . . as absolute an act of treachery as the massacre of Glencoe," though it was primarily intended by way of reprisal for the seizure in the Thames of the Scots Indian and African Company's vessel *Annandale*. "The Scotch Plot," which Mr. Burton introduces as "another incident of the period," proved a mere flash in the pan; but the fears aroused by it found their way into the Queen's Speech and the House of Lords, and helped further to charge the already heavily-laden atmosphere. Mr. Burton takes the opportunity of giving some account of the notorious Simon Fraser of Lovat, of whom Dr. Doran had so much to say in his last gossip about the Jacobites, and of whom the late Mountstuart Elphinstone, as he told Mr. Burton, discovered the "absolute duplicate" in an Afghan chief. On this occasion Simon Fraser's effort was of that tentative sort which in history only seems ridiculous when it is not, sooner or later, followed by a more serious venture of the same description. The Act of Security left the future very much to take care of itself; but Mr. Burton has judiciously pointed out that the supplementary "Act anent Peace and War," provided against the power falling at once and absolutely into the hands of anyone who might be strong enough to make himself master of the situation at the Queen's death. The Act introduced a vital change into the Scottish constitution; but then it must be allowed that the Scottish constitution was generally, in a far more marked degree than the English, at the mercy of the elements. The reason of this lay partly in what Mr. Burton elsewhere notices—"the easy slovenly practice of the estates of Scotland." The Scottish Parliament, which now assumed the right of approving or preventing a declaration of war, had less than a century before been a mere instrument in the hands of the Crown. It is a curious, though to be sure an idle question, whether Scottish Parliamentary life would have endured under a separate government.

In general, we notice with pleasure in these volumes the absence of any tendency, such as the very fulness of the annals of this reign is only too apt to produce, towards making too much of the personal element in national history. Not that Mr. Burton withholds his judgments of persons, which are often both shrewd and generous. Of Queen Anne, narrow-minded though she was in most directions, it is indeed difficult to think without a certain kindness, more especially when one remembers her domestic misfortunes. Her "promised children were so numerous that it is a question whether there were more than seventeen." Six only survived long enough to be baptized; of whom, as is well known, one, William Duke of Gloucester, lived into his twelfth year, when his premature though not altogether surprising death was mourned as a national calamity. That in an age which still clung to such superstitions as "touching for the evil," these losses should have been interpreted as a divine judgment upon the Queen for her impiety as a daughter, is intelligible enough. But it was these very losses which, as Mr. Burton observes, intensified in the Queen the sense of isolation that other causes helped to produce. Her maternal relations declined to rally round her, her uncle, the Earl of Clarendon, actually refusing to take the oath of allegiance. Her husband was a cipher, and her children were dead. Her throne was to go to strangers and foreigners; and thus

perhaps it befell that the Queen's personal friends had far more influence on the destinies of her reign than her husband or her nearest blood relations.

This is at once a reasonable and a generous way of accounting for what is so often ridiculed as nothing but Mrs. Morley's infatuation for Mrs. Freeman. The scandals against the earlier part of Marlborough's career, again, Mr. Burton dismisses in the same generous tone. He is properly treated as the real hero of this History—a genius to whom justice is done even out of the mouth of a jealous rival such as Peterborough. One noticeable feature in Marlborough as a commander was his successful endeavour to preserve a decent and respectable tone among his troops, and even to encourage religious observances among them. This is all the more curious when the general English system of enlistment as practised in that age is borne in mind. Mr. Burton has very graphically illustrated the recruiting practices of Sergeant Kite and his fellows; and it is certainly remarkable that out of materials thus collected Marlborough should have formed the army which, after Blenheim, solemnized the morrow of victory by the celebration of a religious service at the head of every regiment. It would appear that the navy was less perfectly regenerated than the army—doubtless because of the "greater temptations to rapacity" besetting the former service. Peterborough bitterly complains to Godolphin of the scandalous greed of admirals and sailors, which, together with their ignorance, will, he fears, prove ruinous to the cause of the Allies.

Of Peterborough himself Mr. Burton could not fail to write with something of the picturesqueness which any mention of that erratic hero's name seems naturally to call forth in an historian; and the following lively passage draws an effective contrast between the most brilliant figure of the Spanish war and the refugee general, the memory of whose failure has survived that of his services. We may add that Mr. Burton declines to see in the defeat of Almanza more than "the typical drop in the bucket—the last incident that proclaimed the victorious side"; and that he suggests a measure of consolation for our national pride in the fact that "the number of British soldiers in the battle, if they exceeded three, did not reach four, thousand":—

We have already seen that Galway was a soldier of the French type; and, though it may not be said that Peterborough was a soldier of the English, or indeed of any type, he was such a soldier as England only could produce and tolerate. The gravity and supreme importance of the great game of war had, by long traditional influences, impressed on the French soldier the solemnity of everything, from the grandest efforts of heroism to the smallest pedantries of discipline, while he is on active duty; and whatever frivolities or eccentricities may live in his character are dormant there. ... at Galway was the French soldier cultivated to a high type made any ... nest co-operation between him and Peterborough impossible; it would ... ve been as if in the performance of some solemn religious rite a bishop o[f] the Church of England and a ranting Muggletonian were appointed to co-operate. Both these generals were men of high heroism and generous nature; and, where sagacity has been employed in discovering animosities and jealousies between them, the utter unconformity of their natures may suffice to account for the disastrous results. That they acted apart and had separate careers was more the doing of Galway than of Peterborough. The distinguished French commander acted on the impulses of the respectable man who, seeking a correct and decorous walk through life, finds himself thrown into company and co-operation with that eccentric discarder of conventionalities colloquially described as a 'harum-scarum.' Anything that distinguished Marlborough from the French commanders was in a different shape—that of a vast superiority over them in their own special qualities. This has been emphatically acknowledged by the great Napoleon, not only in the reverence paid to his memory, but the efforts to make Marlborough's military career a lesson to the officers in the Imperial service of France.

We observe, by the way, that Mr. Burton agrees with Lord Stanhope, who had not the same materials at command for arriving at a definite judgment on the point, in regarding Defoe's (if it was Defoe's) Captain Carleton as an historical personage and his Memoirs as an historical authority. The question seems fairly ripe for a full exposition and final settlement.

The author of this History, as we have already indicated, is by no means prone to overrate the influence of personal character and personal motive upon the progress of national events. This is nowhere more visible than in his account of the occurrences which led to the catastrophe of the Whigs in 1710, and indirectly prepared the conclusion of peace. He cites, in order to supplement or correct it, the saying of Hallam, that "the House of Bourbon would probably not have reigned beyond the Pyrenees but for Sarah and Abigail at Queen Anne's toilet." It is only fair to add that "the sagest of historians" had, a sentence or two before, attributed the downfall of the Whigs to the coincidence with the Court intrigues of the popular clamour against Sacheverell's impeachment. Less judicious writers have attributed to one or the other cause individually a result which was partially due to the co-operation of both. Thus Mr. Burton cites from the historian Paul Chamberlen a review of the consequences of the "one man" Sacheverell's conduct, which reads something like a prose version of the famous passage against the Corsican usurper in the *Rejected Addresses*. Of the Sacheverell commotion itself, however, we have no hesitation in saying that Mr. Burton has furnished an account which future historians of Queen Anne's reign will do well not to overlook. He must, we think, be allowed to have made it tolerably clear, not only that the debate on the impeachment, rather than the punishment to which the impeachment might lead, was the essential object of its

promoters, but also that, notwithstanding the popularity gained by their nominal victim, the purpose of the Whigs was in some measure fulfilled. The extreme paucity of Jacobite references in the debate furnished the best testimony possible to the weakness of the Jacobite cause; and Sacheverell himself, following either the advice of his friends or the promptings of his own discretion, in the course of the trial spontaneously offered an earnest prayer that the succession might be perpetuated in the illustrious House of Hanover. Nor is it without significance to find that, at all events according to Burnet, the general impression as to the Queen's favouring Sacheverell was erroneous; inasmuch as, though several of her chaplains openly showed their goodwill towards him, the Queen herself told the Bishop "that it was a bad sermon, and that he," the Doctor, "deserved well to be punished for it." Queen Anne's observation, as reported by the Latitudinarian prelate, is, however, unlikely to have troubled the mind of the assailant of comprehension and toleration much more than the four episcopal speeches against him in the House of Lords. He belonged to a school which was rarely troubled by doubts as to the positions maintained by it; and his own mind seems to have been of a class to which uncertainty is, so to speak, unknown. At the same time, Mr. Burton is to be commended for his desire to do justice to a man standing "alone among the objects of great popular contests, as one who has had no historical vindicator." It certainly seems hard, because the papers read by Sacheverell at his trial in his own defence were very different in tone from his sermons, to conclude at once that the former were not of his own composition. In Mr. Burton's opinion, the sermons, as well as the papers in question, "are works of ability—of so much ability that one can quite understand his suiting different tones of thought and language to different conditions." Altogether, the choice of a victim was not quite so fortunate for the Whigs as they may have at first supposed; and undoubtedly Mr. Burton is right in blaming their want of judgment in selecting a clergyman. The days of Queen Anne were nearer than our own are to the times of clerical, more especially episcopal, martyrs. Yet it seems as if at first they had actually thought of flying high in this direction, and of calling to account the Bishop of Exeter, Offspring Blackall, the eminent High Churchman whose Puritan *prænomen* still survives among the descendants of his family in Essex. A combatant of the lighter sort on the same side was Dr. William King, whose ready pen vindicated the High Church champion against the *Modern Fanatic* of William Bisset. Mr. Burton has some curious notes on both these popular controversialists, and shows incidentally how, in the great art of literary mystification, King was, not indeed the instructor, but the predecessor of Swift.

We had intended to advert to some further points of interest in these volumes, but must conclude with a single query. The general candour and fairness of Mr. Burton as an historian is such that we confess to having had our breath taken away by a passage in his last volume relating to the Irish penal laws against the Roman Catholics. Allowing, as a matter of course, that these laws are "palpably and offensively visible in the Irish statute-book," he expresses his wonder at the absence of all evidence as to their enforcement. This, he thinks, "is all the more remarkable as much has been said about an infamous wretch named Garcia, not an Irish Orangeman but a Portuguese Jew," notorious as a priest-hunter. If Mr. Burton will turn to Mr. Lecky's chapter on Ireland in his late *History of England in the Eighteenth Century*, he will find—first, that Garcia was not the only person of his class, even in a period as to which our information happens to be peculiarly scanty, and, moreover, that for the previous years, which belong to the reign of Queen Anne itself, there is no lack of cases showing that, in the matter of priest-hunting at all events, the penal statutes were anything but a dead letter. In other directions, too, this chapter might furnish some suggestive comments on Mr. Burton's "dubieties." The entire question is far too wide a one for cursory treatment; but, while admitting our inability to point offhand to instances of two special results of the penal legislation asserted to have flowed from it, we cannot but express our surprise at the tone of scepticism in which Mr. Burton indulges as to that legislation having been practically enforced at all. Without actually saying that it was not, he expresses a wish to have the traces of its enforcement pointed out to him. This is, to say the least, an unsatisfactory way of treating a topic which is hardly of a nature to be dismissed with a mere note of interrogation.

OLD GLASGOW.*

"A FISHING town on the Clyde has grown into the rich and populous Glasgow." Thus we find, in the most popular of recent English Histories, the history of Glasgow from the Union onwards shortly told. And those who know no more of its history might well wonder how Mr. Macgeorge has contrived to fill the handsome quarto we have now under review with memorials of a place about which there was so little to tell. But, truth to say, there is quite as much fallacy as force in the sentence we have quoted, [illegible] town was the seat of an archbishopric, and could boast of a cathedral of fair form and ancient date. It had a university too, second only to St. Andrews in antiquity of foundation, of which it was said in the sixteenth century by one who had travelled much, "There was no place in Europe comparable to Glasgow for guid letters during these yeirs for a plentiful and guid chepe mercat of all kynd of languages, artes, and sciences." Glasgow has indeed, in more ways than one, a history that is quite exceptional among cities. A brilliant modern writer tells us that a city must be considered as the embodiment of the idea of an age. Now Glasgow may be considered as the embodiment of the ideas of several successive ages. In the earliest stage of its history it represented the faith that planted the Cross of Kentigern on the banks of the Molendinar. On the very spot where the simple cell of the Celtic saint once stood the same faith, expressed by mediæval fancy, was embodied in the stately church whose slender spire is now lost amid the crowd of factory chimneys that have sprung up round it. Again, the first stirrings of the desire for learning endowed in Glasgow a college and a grammar-school as early as the fifteenth century, while the intensely practical spirit of the present age is embodied in the modern Glasgow, the great commercial centre—the epitome, so to speak, of all the various industries to which Britain owes its present greatness. For here the looms of Manchester, the furnaces of the Black Country, the shipbuilding yards of the Thames, the commerce of the Mersey, find formidable rivals. Yet little more than a hundred years ago, the Broomielaw, whose wharves are now crowded with shipping from every quarter of the globe, was yellow with the blossom of the broom bushes from which it gets its picturesque name, and which lingered on even into the present century.

In its infancy Glasgow had a hard struggle for existence, oppressed and overshadowed as it was on either side by the two Royal burghs, Renfrew and Rutherglen. These have now sunk into insignificant suburbs of their larger neighbour, but the payment of 200*l.* annually by the Clyde Trustees to the burgh of Renfrew, as compensation for damage done to its fishing, keeps alive a memory of the day when the Bishop's town had to yield its rights on the river to the King's town. And in former days, when the annual fair, which now pours out the whole working population of Glasgow on the shores of the Clyde, drew strangers to the town, the bishops had to get a special exemption for themselves and their burghers from the exactions of the burgh of Rutherglen, within whose territory the fair was held. Indeed, for long the very life of Glasgow depended on its bishops. Even when the town was allowed to choose its own magistrates, the election had to be confirmed by the bishops, and no writ was attested without the bishop's seal. The bishop, too, incorporated the trades, and the fines levied by the several guilds of the crafts were paid for the support of the Church and its services. It is not until the Parliament of May, in 1546, that Glasgow appears as sending its commissaries, and the first mention we find of it, classed with other burghs, is an enactment of 1555 to the effect that "Glasgow, Irvine, Ayr, Dumbarton, and other burghs of the West" shall be free to trade in Loch Fyne herrings. This permission of free-trade in herrings was the beginning of the town's commercial prosperity, and herrings were for long the staple of its trade. Not before the reign of Charles I. did Glasgow attain to the dignity of a royal burgh. William I. had by charter first raised the hamlet to a burgh, but it was not until the second William ruled over Scotland, more than five hundred years later, that the finishing touch was put to its liberties by an Act empowering the city and Town Council to elect their own magistrates as freely as the city of Edinburgh or any other Royal burgh. Nearly thirty years after the passing of this Act the first ship sent out from Glasgow to the New World crossed the Atlantic; but from that time so rapid was the increase of trade that, after the lapse of half a century, we find it noted that in the year 1775 half the tobacco imported into Britain passed through Glasgow. Yet even then it was impossible for any vessel drawing six feet of water to come up the river except at high tide. The tobacco trade was then the great source of wealth to the city. The Virginian merchants, or "tobacco lords," as they were called, built large mansions and lived in princely style. The street where they lived still bears the name "Virginia Street," and they bullied and brow-beat their fellow-citizens quite as much as the ecclesiastical dignitaries had done in the days of the bishopric. Not so very long ago there were old people living who could tell how in their youth one side of the principal street was wholly given up to the tobacco lords, who strutted and swaggered there at midday in long scarlet cloaks, full wigs, and cocked hats, attended by powdered footmen in full-dress liveries; while any person of lower rank who had business with one of them would hover about on the other side of the way till he caught his patron's eye, and got some encouraging sign before he ventured to address him.

The written materials for the early history of Glasgow are meagre. They consist mainly of the records of the bishopric, and, after the downfall of episcopacy, of the books of the Kirk Session. But, as these sources of information do not go back beyond the thirteenth century, Mr. Macgeorge prefaces his history of Glasgow by a general view of Scotland, and of the manners and customs of its inhabitants as they have been set forth by the best authorities. He thus traces the progress of the place through the various stages of its growth, from the days when the inhabitants of Clydesdale lived in weems and crannogs down to the present day, when it can boast of having the purest water and the foulest air, the greatest variety of manufactures and the tallest factory chimneys, or "stalks" as they are called by the natives, of any town in Britain. It is to the cathedral that Glasgow owes its existence as a burgh, while it is to the river that it owes the

* *Old Glasgow: the Place and the People from the Roman Occupation to the Eighteenth Century.* By Andrew Macgeorge. Glasgow: Blackie & Son. 1880.

spring of new life which prevented it from being crushed by the fall of the bishopric. Bound up as the life of the burgh was with the fortunes of its bishops, it is in the archives of the see that we must seek its early history. Fortunately the episcopal register forms one of the few records left to us of Scottish Romanism. Preserved as it has been by the merest chance, the story of its preservation is well worth telling, though Mr. Macgeorge does not give it. Beaton, the last of the Roman Catholic Archbishops of Glasgow, fled from Scotland when the old Church was overthrown, and he took with him to France the treasure and records of the see. These he placed for greater safety in the Scotch College in Paris, and there they remained until the outbreak of the French Revolution. At that time the brethren of the College, seeing that their only safety lay in flight, packed up in barrels the manuscripts of the English and Scottish Romanists and Jacobites which had been left in their custody and sent them off to St. Omer. They have never since been heard of; but fortunately those relating to Glasgow were not among them. And the Abbé Paul MacPherson, head of the Scotch College at Rome, when passing through Paris in 1798, received two volumes of the chartulary and other records of the see from the hands of Father Innes, the only inmate left in the college. Father Innes himself had only just escaped the guillotine by the death of Robespierre on the very day on which he was doomed to die. After passing through several hands, the register was printed for the Maitland Club, and it is by the help of its contents that Mr. Macgeorge is enabled to draw a truthful picture of Glasgow and its inhabitants in the days when its chief claim to importance lay in being the bishop's burgh.

Of the domestic buildings of that period none are left. The wattle huts of the village were gradually replaced by the more pretentious dwellings of the burghers, but still these were only of wood, and it was not till the town had been twice consumed by fire that the magistrates bethought them of inducing the people who had been burnt out to rebuild their tenements of stone. The bishop's palace and the "manses of stone" built for the "rectors," which we take to mean the canons, of the cathedral, have all disappeared. The cathedral itself is therefore the only building that remains of what can be, strictly speaking, called Old Glasgow; and, by a strange freak of fortune, it remains entire, having escaped the plundering hands of what John Knox called the "raskill multitude," who made the Reformation an excuse for destruction and plundering. There is a legend that the craftsmen of the city armed for the defence of their church when its safety was threatened by over-zealous reformers, but as this is said to have taken place in 1578, and as only a few years before the kirk had urged upon the State the need for "preservation and upholding" of Glasgow Cathedral, such an attack, if it was made, cannot be laid to the charge of Knox or of the Church which he established. To whatever cause it may be ascribed, this building, one of the finest of the pre-Reformation churches, has passed unscathed through the changes that have brought ruin to nearly all the other ecclesiastical buildings of Scotland, and remains a solitary memorial of the age whose piety or superstition found expression in rearing vast piles of architectural magnificence throughout the length and breadth of the land. The High Church, as it is now called, belongs to the First-Pointed period. It was begun by Bishop Jocelyn in 1181, and continued by his successors down to the time of the Reformation. Subscriptions were raised for it all over the kingdom, and indulgences granted to all the faithful who should contribute to it; but the design was so great and the execution so tardy that it gave rise to the popular saying which likened any apparently endless task to St. Mungo's work because it would "never be done." Small and plain as the church must appear when compared with the cathedrals of England, it can boast of a crypt perhaps unequalled, certainly unsurpassed, in Britain. This crypt was the work of Jocelyn, and it was in honour of its consecration that the famous fair was instituted. But the interest awakened by the sight of Glasgow Cathedral is due more to the historical memories associated with it than to the architectural merits of the building itself. In the two greatest crises of the national history the great church of St. Mungo has unconsciously borne a part. Before the high altar Robert Bruce was solemnly absolved from the guilt of sacrilege and murder, the Church thus giving her sanction to the people's choice of a champion. And it was within the same walls that more than three centuries later crowds flocked to sign the "Covenant," round which the nation rallied on the alarm that England was once more trying to put the yoke on their necks under the peaceable guise of a liturgy. Since that day conflicting words of doctrine have wakened the echoes of the old Church as it has passed through those strange phases of Protestantism which have in turn been imposed upon Scotland. Since the days when the fabled miracles attributed to St. Mungo were read as the lesson on the day dedicated to the saint, the brightest lights of the Church with a liturgy but without bishops; of the restored episcopacy; of the Church of the Covenant; and, most anomalous of all, of the Church with bishops but without a liturgy, have successively had the ear of crowded congregations in the crypt as well as in the choir. And there, in that same choir where in the palmy days of the Church the retainers of the two archbishops bandied blows on a question of precedence, perhaps in the very stall of that chivalrous prince who was a canon of the cathedral as well as King of Scots, sat Cromwell and curbed the wrath of his Ironsides, bidding them listen in peace to the dreary tirade aimed at them by Mr. Zachary Boyd. Glasgow had some bishops, too, of whom she might well be proud. Of these were Jocelyn, who laid the foundation of the fortune of the burgh with the first stone of his famous crypt; Wishart, who bore so brave a part in the war of independence; Turnbull, the founder of the University; and Dunbar, whose sumptuous banquets are celebrated in the Latin verses of Buchanan. The infant convocations of the college were held in the crypt of the cathedral. The old buildings, now superseded by the handsome structure at Gilmour Hill, but still standing in the High Street, are not of older date than the seventeenth century. But they have a claim to honour of which their successor can never rob them; for inside these walls Adam Smith first taught the principles of the science that has changed the policy of nations, and James Watt perfected those experiments which placed in the hands of man the new power that has revolutionised the industrial and commercial world. It is noteworthy also that the first successful application of steam for purposes of passenger traffic by water was made by a house carpenter of Glasgow, Henry Bell, the projector of the first steam-boat that plied upon the Clyde.

The cathedral and the college excepted, there are almost no traces of old Glasgow left, its memories now lingering only in the local nomenclature, which to strangers is quite unintelligible. Thus St. Rollox, the great chemical manufactory, perpetuates the name of the chapel on whose site it stands. This chapel was dedicated to St. Roche or "Rok," Rollox being a misreading of the genitive "Rokkis." The old wynds and closes, with their queer names and crazy tenements, are fast disappearing before the Dean of Guild and the march of modern improvement; and the stranger seeks in vain for such picturesque "lands"—as a many-storied house is styled in Scotland—as he finds in Edinburgh. But the different aspect of the two cities has been caused by the very different conditions affecting their growth. Edinburgh was not only shut in by walls, but also by a bog on one side and a lake on the other. Thus the only way in which it could find house-room for its increasing population was by towering upwards. Glasgow, though it had gates, seems never to have had any walls; and, unchecked by natural impediments, it has spread out across the river and over the undulating country round, until now it stands upon as many hills as Rome itself. If, indeed, we accept Kentigern as the founder of the city, its continuous extension bids fair to prove that "St. Mungo's work never will be done." Mr. Macgeorge has enlivened his pages with some reproductions of old prints and sketches of old bridges and dwelling-houses now swept away. He has also gone carefully over the records of the kirk-session, and gives from them many extracts, both instructive and amusing. In short, he has thoroughly succeeded in giving a spirited and faithful picture of the life of the people in the several stages of the city's growth. In the times of the Church supremacy we see the magistrates humbly waiting upon the bishop in his palace garden, and hear the tinkle of St. Mungo's bell as it is rung through the streets to beg prayers for some departed soul; then, after the bishops have passed away, we have the provost, generally some county magnate, with his baillies, strutting through the town, preceded by his scarlet-clad drummers, trumpeters, and pipers; and finally, and not very far distant from our own day, we see the "searchers" scouring the Green and other places of public resort, and pouncing upon all culprits who could be caught red-handed in the crime of walking abroad on the Sabbath during the hours of divine service. This practice continued till the middle of the last century, but the last victim prosecuted the "searcher" who had seized him, and thus put an end to the practice by proving it to be illegal. Mr. Macgeorge has also a chapter on the canoes and other pre-historic remains found from time to time in the Clyde basin, and he furnishes statistics as to the price of labour and commodities at different periods, which enhance the value of his history as a book of reference. Indeed he has omitted no subject which comes within the scope of his scheme, and has spared no pains in getting the fullest and most accurate information attainable on these subjects. As he has made no attempt to obscure the facts of his story with popular fictions or fine writing, but says in a simple straightforward way all that can be said about the past of Glasgow and its inhabitants, his book ought to be bought and read by all those among his fellow-citizens who take any interest in the childhood of their city. Full justice is done to the worth of the contents by the excellence of the type, the paper, and the illustrations. The arms of the city form the chief decoration of the cover. The emblems on its shield, once borne by the bishops, represent the miracles ascribed by monkish legend to St. Mungo. These emblems are the robin of St. Serf that St. Mungo restored to life; the hazel twig which he breathed into flame, now represented as a spreading oak; the salmon that at his bidding brought back Queen Cadzow's ring; and the quaint square bell of St. Mungo, long preserved and used at the cathedral services. The motto, "Let Glasgow flourish," is shortened from the inscription on the old Tron bell, "Lord, let Glasgow flourish by the preaching of the word." The pious aspiration has been in a manner fulfilled. Glasgow has indeed flourished beyond all precedent, and, humanly speaking, the word to which she owes her prosperity is that gospel of freedom, as the only true principle of trade, whose first faint echoes reached the world from within the precincts of her ancient university.

DESERT LIFE.*

WE have seldom met with a book of travel whose brilliant and attractive exterior was more absolutely belied by the contents. *Desert Life* is inexpressibly dreary. You lose yourself in dismal wastes of words in which the oases are few and far between; and the wastes are broken up in abrupt sentences through which you labour painfully under an irritating sense of oppression. Nor is there hope in scanning the far horizon as you cast your eyes forward over the pages. Before, as behind and all around you, is the same involved monotony of phrase, where the meaning is distorted, perverted, or obscured by strange phenomena of verbal refraction. We do not feel sure as to the author's nationality. From the names on the title-page—B. Solymos (B. E. Falconberg)—we are inclined to believe him a German by extraction, semi-orientalized in the course of service in the East; and as a foreigner we should have been disposed to treat him with exceptional courtesy. But, in the first place, he has over-taxed our patience, till we smart under the sense of intolerable injury. In the next place, whatever his nationality may be, he invites no consideration on account of it. On the contrary, he displays, with an almost arrogant self-assurance, an extensive though peculiar acquaintance with our language, which he has enriched with a variety of expressions more likely to have been picked up in the desert than in the dictionaries. He is perpetually striving after originality, not merely in his language, but in the method of his arrangement. He is fond of dispensing with those parts of speech which are most indispensable to the intelligible construction of sentences; and he fetches his metaphors and illustrations from extreme distances, having hunted them up in the most unlikely quarters. So much we have said to relieve our feelings, and by way of warning to the reader; but we must add in justice to Mr. Solymos that we are very sorry to have cause to say it. For there is much instructive and valuable matter in his volume, had it only been given in a more agreeable shape. Besides being doubtless an excellent authority in his own profession, he is evidently a man of science and extensive erudition. He is intimately acquainted with the classics as well as with general modern literature; he is versed in natural philosophy, geology, &c., and he is a good practical zoologist and botanist. Had our learned Societies been in search of an emissary to report on the physical and climatic aspects of the Soudan, we doubt whether they could easily have found a better man than Mr. Solymos. It is the more provoking that so capable and intelligent a traveller should gratuitously indulge in a style of writing which we must illustrate by a passage or two taken at random, in vindication of criticisms that might otherwise seem ill-natured:—

> Many find ample amends in the glorious sense of liberty, in wandering through the Aleian plains, with hardly even a thought approaching to melancholy Bellerophon's feelings, whose eyes must have been fixed somewhere under his chin, like the eyes of an isopod crawling on the sea-bottom. . . . Not a tenth do people in the desert feel the solitariness of an average bachelor in town, a place which belies its sweet name of a metropolis. The most kindred thing—if it is not the same—to a great city is—in the eyes of those hundreds of thousands who care neither for what they may have of so-called society, nor for crowds—the pagan Hades, with a touch of other Infernos, as far as brute noise is concerned. The human forms, for all practical purposes, are walking mute shadows, unless to those noisy few who, Ulysses-like, have a mind to collect and can afford to collect, select, and dissolve the lips of such as they might choose—making them talk by the flow of frothy riches, or sparkling success, seasoned with the necessary grace of manner and tempered by the humour of human kindness.

Or, again—and there is one advantage in making random selections from *Desert Life*, that you can seldom do injustice to the author's meaning by taking a paragraph apart from the context or by breaking off abruptly in the middle:—

> Notice the work, poor though it be, of these desert animals, and verily the behest of obedience and binding work went forth to all animation, before it obliged the *noblesse* in the first man. Is not that giraffe lofty enough; and is it not strong enough to do the work of a steam crane? Yet it is sent panting by yon puny carnivorous messenger. Is not that lion powerful enough? Yet it is commanded to contract and crouch before risking a jump. And are not the various perfections and careful preservations, and accelerated multiplication, and care and safety of other animals, merely a price for the service they render or pleasure they afford to man? . .
>
> Men's souls have been prepared by being commanded to be contrite, and they have been taught to obey; the only true means towards understanding, and that "in part" only. They have been prepared by the earlier masters, the tried patriarchs of the deserts, by Hyobe or Job if you prefer it, and the rest; till it was time for the Great Master Himself to assume our shape and to call forth the long-projected and long-promised inauguration of the last and most sublime of the successive metaphors, aspiring to the divine.

And so on, for a couple of pages more, of equally impassioned and discursive moralizing. But it is time to attempt to give some idea of the substance of the volume, and to refer to some of the really interesting information which Mr. Solymos envelops in clouds of words.

The deserts he visited were those to the west of the Nile, between Dongola and Darfour. The heat was terrific, and often excessively trying even in the encampments, in spite of all expedients for mitigating it:—

> Of were lit by touching the sand with them. People who worked their metal instruments without gloves—and every one except your effeminate servant here did—got awkward big blisters. Even the mahogany tripods—unfortunately not polished—were painfully hot; and an eyelid too near the brass work of the telescope was instantly baked into a pretty loaf.

The wells were often situated at great distances, with several days' march of six or eight hours between each; and there was always the possibility of a well being found dry, which might have doubled the interval between replenishing the water-skins. The camels could go ten days without drinking, and their breeders asserted that in winter they could hold out for a fortnight. There can be no question that the Bedouin spoke the truth, for on one occasion, and in the hottest season of the year, the camels of Mr. Solymos's party endured for twelve days. Two of them, indeed, broke down near the wells, but they were revived by having water-skins sent out to them. Mr. Solymos, by the way, mentions a touching trait in the behaviour of the Bedouin drivers. Rather than be urged to over-drive the animals, they secretly reduced their own water allowance; when one of them who was harder worked than the rest came to ask his master for a draught on the sly. The description of the wells, welcome as they were, by no means realizes our romantic notions of "diamonds in the desert." Some of them are at the base of the rocky brims of table-lands, but for the most part they resemble so many small craters studded over the surface of some deep depression. Even where there is more or less vegetation in the neighbourhood, the immediate surroundings are barren in the extreme. Frequently the wells are either actually filled in, or choked at all events, with clay and sand. Sometimes there is a tainted pool of water over a substratum of contaminated mud. They must always be either excavated or purified, at a great sacrifice of precious time, while the parched travellers are painfully tantalized. When the wells have been put in working order, buckets have to be extemporized, usually by stretching the water-skins upon hoops. And, finally, order must be kept among the animals, who drink almost to bursting after prolonged abstinence, while their instincts warn them to fill their reservoirs against the certainty of privations to come.

The insect pests of course figure conspicuously in Mr. Solymos's pictures of his desert experiences. There were mighty hornets measuring an inch and a half across the body and two or three inches across the wings—"galling troubadours," as he poetically calls them. Moths and butterflies swarmed, attracted by the lights in the tents after sunset, till "plates and basins of liquid became tiled over with them." Perhaps the most serious nuisance were the hordes of termites. "Even the slippery glass bottles did not rebuff the steady aspirations of these small shadow-loving pale vermin." They made their way through wooden boards like water soaking into the pores of a sponge. They even penetrated into iron-plated boxes, by invisible chinks caused by the heat. Flies of many species were gathered in myriads round the wells. More dangerous than those troublesome termites were the scorpions. They haunted the thoughts as well as the tents of the explorers. "Their bodies were as broad, and almost as full, as a finger; their fangs as broad and plump as those of small crawfishes." And they seem to have been unpleasantly social in their habits, for, though there might be no appearance of them on the spot chosen for the encampment, they had invariably collected before morning under the packages and the carpets. Mr. Solymos's body-servant kept a pair of tongs always in readiness, and used to exhibit, with the satisfaction of a successful hunter, any unusually formidable specimen he had captured. There was danger in straying from camp after nightfall; and even the Bedouins, brought up from infancy in the desert, took care to keep within sight of the fires. The atmosphere was broken into mirages by the moonshine. The fires became invisible at a short distance; and, strangely enough, the report of their guns was audible no further than the lights were distinguishable. "It seems as if sound and light were here broken and cut up by the cracking dryness of the air, as the casual foliage of the thorn tree is frittered away, and as the very rocks are bruised into stones and dirt, which again seem made to split and absorb light and sound also."

The author makes some remarks that strike us as very sensible as to the regimen and the habits of desert travel. He is by no means an advocate for ascetism of diet, though abstinence or indifferent commons must sometimes be matter of compulsion. But his party travelled with an ample train of baggage camels, and appear to have been exceedingly well supplied with luxuries. They lived chiefly on vegetables, soft milk puddings, fruit, and bread. They had preserved fish besides; and in the way of meat they fared sumptuously when they bought a sheep or succeeded in bagging some game. Antelopes abounded in much of the country they traversed, and were often snared or trapped by the Bedouins. Apparently they could indulge in a choice of beverages; they had cases of wine, and even beer, though beer is naturally unsuited for keeping in such a climate; and there were coffee, tea, and cocoa, of which the first was their great resource. To preserve his health and give fair play to the digestion, Mr. Solymos found it advisable to vary the seat on camel-back with occasional hours of pedestrian exercise, disagreeable as the effort might be at first. And he was in the habit of making but chary use of the medicine-chest, leaving trifling ailments to cure themselves. His own constitution seems exceptionally adapted for effort and exposure in those scorching regions; and he prides himself in getting through a great amount of brainwork in an atmosphere which is popularly

* *Desert Life: a Recollection of an Expedition in the Soudan.* By B. Solymos (B. E. Falconberg), Civil Engineer. London: Allen & Co. 1880.

believed to be enervating almost to the point of paralysing the faculties. We wish that we could have said more in favour of his book; but he would have owed us little gratitude in the long run had we not prepared our readers for the character of its contents.

COX'S DERBYSHIRE CHURCHES.*

MR. COX has at last brought to completion his laborious and interesting description of the old churches of Derbyshire. We may appreciate the thoroughness of his work when we consider that, although it only includes ancient structures, these four volumes give descriptions of 219 churches and chapels, taking in two or three ruins; the whole number of benefices in the county (comprising, of course, newly-formed districts and rebuilt churches) being, according to the *Clergy List*, 247. The illustrations are numerous; the representations, both external and internal, of the more important buildings being "heliotypes," and of the details woodcuts. Yet, strange to say, not a single ground-plan is given, although the arrangement of several of the churches is of much ecclesiological interest. We are sorry that a work of such research, and one containing so much important matter, should be defective in so obvious and useful a feature. Derbyshire is a district of bold contrasts in its physical conformation, as it rises from the flat and swampy meadows which hug the Trent along its southern border, and, beyond a middle region of rolling hills, presents the bold and almost mountainous masses of limestone and millstone grit which compose the Peak. Accordingly it is also a region of churches strongly diversified not only in detail, but in proportion and character; some of them very noble in bulk and in arrangement, and others small, mean, and homely; while in either case they are of every period of mediæval architecture. In Derbyshire we find the Saxon crypt of Repton, and other fragments of days before the Conqueror; and in contrast to these, besides examples of Norman and of the first and second periods, the latest Perpendicular abounds. The county has never boasted of a cathedral, as it has been attached to Lichfield from the earliest foundation of that ancient Saxon see down to its present contingent transference to the inchoate Bishopric of Southwell in Nottinghamshire, in which change, which is of no benefit to itself, Derbyshire acquiesces out of regard for the general good of the Church. Nor has there ever been an abbey of the first class in this shire. But, in compensation for such deficiencies, it can claim the possession of several parish churches of unusual dignity. At Melbourne, a small town which has had the accidental honour of giving his title to a Prime Minister, and through him its name to an Antipodean capital, stands a Norman church which is, in general conception and in dignity of detail, a cathedral in miniature—"a cruciform structure, with a tower in the centre, having chancel, transepts, nave with side aisles, and a western portico flanked by two small towers." This is entered from the west "by a noble semicircular doorway. The central portico is covered by a groined stone roof," and there were spiral staircases to both towers, one of which still exists, besides "two smaller porticos with groined roofs at the basement of those towers, communicating with the central portico and also with the side aisles." It is vexatious to have to spell out these details without the help of a plan, and after all not to be quite clear as to the shape or bearings of the porticos. There were originally three apses to the transepts and to the east end, all of which were pulled down at the end of the fifteenth century, and windows placed in the substituted flat walls, one of those in the transept being of Middle-Pointed date, and clearly moved from elsewhere. The cruciform church at Bakewell is a hundred and fifty feet in length, and, until the disastrous days of a restoration which was begun in 1841, the nave was an example of a very stern and simple type of Norman with square piers and unchamfered arches. This, with the exception of one bay on each side left as samples, was for some fancied demand for accommodation destroyed, and more slim pillars in a later style of Pointed substituted. The central steeple is noticeable for the octagonal belfry story from which the spire springs. Ashbourne boasts of an even more ample cross church a hundred and eighty-five feet in length, and presents all styles of Pointed, while a very noble central spire gives great dignity to the composition. Yet the nave is only flanked by an aisle on the south side. The Renaissance tombs of the Cokayne family in this church are very fine, and some of the windows have been enriched with painted glass of great merit by Hardman. Chesterfield is also conspicuous for a cross church with central spire, of the same date, as Mr. Cox believes, with the tower—namely, between 1350 and 1370; but as it was unfortunately made of wood covered with lead, through warping, it got twisted into a most grotesque form, which is of course from its singularity very precious to the inhabitants of the place. This also is an unusually large church, having a length of 171 feet. Some of the windows contain interesting flamboyant tracery, one of them being circular.

In the old-world town of Tideswell, which nestles in a little valley in a bleak upland district of the Peak, we find a noble cross church of second and third Pointed, which has been handsomely and intelligently restored. The western tower, which is of the later period, offers a striking sky-line of four large pinnacles at the angles and of four smaller ones, each of these rising from the centre of one of the faces. The singular feature in the internal arrangements is that, while the chancel is of minster-like proportions, there should be no true lantern. There are a chancel and transept arches, but there is no western one, and the nave roof extends uninterruptedly for its whole length up to the chancel arch. The original reredos of the high altar still exists, extending across the whole width of the choir at about six feet forward from the east end, and contains a door in its northern portion leading into the space behind, which must have been a sort of sacristy. The composition is adorned with two large niches, but otherwise is plain, having probably been decked with hangings. In the chancel still exists a curious brass of Robert Pursglove, suffragan Bishop of Hull. Pursglove, who had been Prior of Gisburne and Provost of Rotheram, was in 1538 consecrated to one of the suffragan sees set up by Henry VIII.'s Act of 1535. Mr. Cox, misled by Brett, imagines that his consecration took place in 1552, which would have involved the recognition by the Romanists of that day of the Anglican form of consecration. At a later date he became Archdeacon of Nottingham, and, showed himself a strong partisan of Romanism under Mary. Upon Elizabeth's accession Pursglove refused the oath of supremacy and was deposed, but yet received letters from the Queen to found grammar schools at Gisburne, as well as at his native Tideswell, to the neighbourhood of which he retired. He died in 1579, and his brass represents him in full episcopal vesture, with alb, dalmatic, chasuble, mitre, and pastoral staff. Explain this as we may, the fact of a bishop who died twenty years after the accession of Elizabeth being so depicted is a curious incident. Chelmorton church (properly a chapelry of Bakewell) is said to stand at the highest elevation above the sea of any church in England, and is remarkable for a low stone chancel screen, which has given the hint of many similar ones in new or restored churches. Fenny Bentley church, small one near Ashbourne, contains an elaborate wooden rood screen of late date, which was spared in an unsatisfactory restoration some years ago. In the same neighbourhood we find the fourteenth-century church of Norbury, famous alike for its architecture, its high tombs of the FitzHerberts, and its beautiful painted glass of the period, which, with its delicate grisaille, recalls the contemporary windows in Merton College Chapel. The series of windows was not long since perfect, including excellent glass in the east window. But a rector at the end of the last century plastered up the window to save the expense of repairing it. Afterwards what remained of the glass in this window was surreptitiously sold, and at a later date the blank was filled up with glass torn from other parts of the church, to the manifest injury of the whole series. Dronfield, in East Derbyshire, has a noble Middle-Pointed chancel with remarkably fine tracery in the windows, and sedilia of unusual beauty. The rich painted glass went at some date in the last century, but the brasses of the Fanshawe family remain.

Mr. Cox's reasonable protest against over-restoration may be aptly illustrated by some barbarous doings which have been very recently perpetrated in the large church of All Saints at Derby, the finely-proportioned tower of which is so conspicuous to travellers by the Midland line. All Saints, according to Mr. Cox, was one of the two collegiate churches which existed at Derby in the reign of Edward the Confessor. It is certain that in the reign of Henry I. it was given, still retaining its collegiate foundation, to the Dean and Chapter of Lincoln, who then became patrons of the Dean and Prebendaries. In the sixth year of Edward I. it was declared to be a free chapel of the King, exempt from all ordinary jurisdiction and immediately subject to the Pope, and in particular the Archdeacon was kept out. A few years later the Bishop of Coventry and Lichfield tried to assert his jurisdiction, and was resisted by the Dean of Lincoln. The King summoned the Bishop to Winchester for contempt, both of himself and the Holy See. Upon the trial the jury found that the Bishop always had certain jurisdiction within the church, as of holding ordinations, taking synodals, and of exercising discipline; but that to the Dean of Lincoln belonged collation and institution without any presentation from the Bishop. The College was dissolved in the second year of Edward VI., and the lands sold. Still a small portion seems to have been left, which Mary in the first year of her reign assigned to the bailiffs and burgesses of Derby for the maintenance of two vicars of All Saints. The Corporation neglected (herein we should fancy acting with wisdom) to carry out what would have been a very unworkable constitution, as at the present day St. Saviour's, Southwark, shows, and maintained instead one vicar out of the stipend which had been, as it would appear, intended for both. To this they added a reader out of the rates; but in the sleepy days of the eighteenth century they thought fit to let the office drop in 1732. Copes, as we are told, were repeatedly mentioned during Elizabeth's reign in the inventories of the goods of All Saints at dates subsequent to the Advertisements, and an alb is recorded year by year till 1576. This may have been, or have been used as a surplice; but even in that case the perpetuation of the name is proof of what is clear to all men, except the Judicial Committee and its admirers, that the ultimate distinction between these two vestures is hard to be arrived at. The Corporation may have stuck to the copes as considering that the church had not lost its collegiate character.

At last, as the eighteenth century went on, All Saints possessed a vicar alike pugnacious and energetic, who conceived that the time had come for rebuilding it. The Corporation did not quite agree, so the vicar caused the old building to be pulled down *vi et armis*, only sparing the tower, and, in 1723, called in Gibbs to

* *Notes on the Churches of Derbyshire.* By J. Charles Cox. 4 vols. Chesterfield: Edmunds. London: Bemrose & Son. 1875-9.

replace it by the existing classical structure. On the sale of Corporation livings consequent on the Municipal Corporations Act, the advowson was bought by the Simeon Trustees. In 1873 the then vicar, nominated by those patrons, led the way to a very free-handed refitting of the interior, marked by incidents which ought to have brought down the combined forces of the ecclesiologists and of the anti-restorationists, but which, strange to say, were perpetrated with impunity, and then legalized, although in Bishop Selwyn's diocese, by an *ex post facto* faculty. The remarkably beautiful iron-work of the date of the present church, executed by an artist called Bakewell, was ruthlessly torn down, and would have been completely alienated but for local opposition; so a compromise, which has however been scandalously neglected, was effected, by which some of it was preserved, though not, as agreed upon, reinstated. A fine old oak pulpit was sold, and a new one, with a desk underneath, set up in the middle of the church, facing the congregation. These are only ordinary barbarities, but there are others which pass belief. We tell the tale in Mr. Cox's words, only adding that the Devonshire monument enjoyed a far more than local fame, and that the plea of additional accommodation in so spacious a church is flagrantly absurd:—

In the centre of the Cavendish Chapel, in the south-east angle of the church, used to stand before the recent restoration, a large monument, twelve feet high, to the memory of William, Earl of Devonshire, who died in 1628, and Christian, his Countess, the only daughter of Lord Bruce of Kinlop.

It is thus described by Simpson:—"Each side of this monument is open, and in the middle, under a dome, are whole-length figures, in white marble, of the Earl and his Lady, standing upright. The angles on the outside are ornamented with busts of their four children; William, the eldest, successor to the Earl; Charles, Lieutenant-General of Horse in the civil wars; Henry, who died young; and Anne, married to Robert Lord Rich, son and heir to Robert, Earl of Warwick." These figures and busts now stand in a row against the south wall, and present anything but a graceful appearance. On the plinth is inscribed:—

"The interior of this Church was restored in the year of our Lord MDCCCLXXVI, and in order to provide additional space for the increased population of the parish, it became necessary to remove the large monument erected to William, second Earl of Devonshire, who died June 20th, 1628, whose remains rest in the vault below. The figures above this slab are those of William, 2nd Earl of Devonshire, and Christian, his Countess; with busts of their sons William, Charles, and Henry, and Anne, their daughter, which formed part of the monument removed."

That parson, churchwardens, and parishioners should have conspired in this Vandalism, after the world has been for so many years flogged up by art teachers and popular historians, is sufficiently deplorable and inexplicable; but there is another feature about the matter still more profoundly astonishing. The monument was not one of a race that had passed away, nor even of one which belonged to some distant part of the country, but of the ancestors of one of the greatest noblemen in England and quite the greatest nobleman in Derbyshire, a man pre-eminent amongst his order for ability, culture, and fulfilment of duty. How could the Cavendishes, who are not a fallen, nor always a very meek race, stand apathetically back and witness their historical monument hacked and demolished? The altar before 1873 was a marble slab supported on an iron bracket which had been placed in the church in 1725. This was pulled down and the slab stuck against the church wall, while this insolently pugnacious inscription was cut into it:—

This slab, supported on ornamental ironworks, was for many years used instead of a communion table, but was removed when the present table was found in the church, and restored to its original use.

SHOLTO D. C. DOUGLAS, *Vicar.*
GEORGE HAYWOOD, } *Churchwardens,*
WALTER RANDALL, } A.D. 1873.

"Wishing a godly unity to be observed in all our diocese, and for that the form of a table may more move and turn the simple from the old superstitious opinions of the popish mass, and to the right use of the Lord's Supper, We exhort the curates, churchwardens, and questmen here present to erect and set up the Lord's board after the form of an honest table decently covered."—Bishop Ridley's injunction, A.D. 1550, in his visitation of the Diocese of London.

"As to the illegality of stone altars instead of moveable tables of wood, see Faulkner *v.* Litchfield."

Mr. Cox pertinently remarks with respect to this war-whoop:—

With respect to this inscription (apart from the question of taste), it may be remarked—that it is rather singular to quote from the injunction of a Bishop of another see, that which could only apply to his own diocese—that it is still more singular to affix the words of a Bishop's injunction to the walls of a church that was to so considerable an extent extra-episcopal—that the word "honest" at that time meant nothing more or less than decent or comely—that the Church of England has used the words "table" and "altar" as synonymous terms both before and since the Reformation.

Again we must wonder when we think that this aggression was committed and condoned in the diocese of Bishop Selwyn. The prominent name in the inscription will strike our readers in connexion with the recent removal of a cross and candlesticks at All Souls' Church, Langham Place. Happily, now that these are gone, nothing is left in that dreary structure which can be spoiled. A curious commentary upon the assumptions contained in the inscription just quoted may be found in the church of Foremark, in South Derbyshire, which was rebuilt in the seventeenth century, and consecrated by Bishop Hacket in 1662. Mr. Cox's description of it is interesting in several respects, giving us as it does an example of the survival of Pointed in a debased form after the Restoration, and also recording a chancel screen of that date:—

The church, dedicated to S. Saviour, is a small plain building, consisting of nave, chancel, and a low west tower, and is of a debased Perpendicular style. There is no structural difference between the chancel and nave, but the former is separated from the rest of the church by a substantial high oak screen of singular design. Four sheets of glass are let into as many large openings therein. Round the altar are wrought-iron rails of excellent workmanship. The altar itself is a large slab of grey marble, 61 in. by 41 in., supported on a wooden table, and is undoubtedly the same that was consecrated by Bishop Hacket. The font we believe to be of Early English date, and consequently taken from the older chapels of either Foremark or Ingleby.

It is rather tantalizing that the author should tell us that the screen is of "singular design," and make no attempt by pen or pencil to explain what the singularity is.

After the publication of his first two volumes, Mr. Cox obtained access to fresh and most important materials in the muniments of Lichfield Cathedral, of which he has made good use, not only in the latter half of his book, but by copious addenda to the former part. In particular he has given lists of the successive incumbents of every parish. He also records the access which Mr. Gladstone gave him to Sir Stephen Glynne's notes, which in the case of Derbyshire extend from 1832 to 1873, and "include all the old churches of the county." In the introduction to his last volume Mr. Cox adduces a curious illustration of the ravages of the Black Death from the fact that, while the annual average of institutions to benefices in Derbyshire during the fourteenth century was 7, and while the number in 1346 was 4, in 1347 only 2, and 8 in 1348, in 1349 it had shot up to 63, and stood in 1350 at 41.

We cannot better conclude our notice of this valuable addition to our national ecclesiology than by quoting some of Mr. Cox's sensible remarks upon restoration, contained in the introduction to his last volume:—

There is much to be regretted in certain of the "restorations" that have taken place even whilst this work has been in progress. On one point I desire to enter a most earnest protest, viz., against the notion that any honour is paid to God, or respect to the memory of those that He created in His own image, by burying inscribed gravestones beneath many inches of concrete, in order to stick therein the glossy tiles of recent manufacture. The effacing or removal (wherever it can be avoided) of the memorials of the dead should in all cases be strongly resisted, no matter what be the eminence of the architect that recommends it. There are not many unrestored churches left in the country, but there are some of much value and interest, for whose fate we tremble. When a "restoration" (the term is a necessity for lack of a better) is contemplated, let it be recollected that all work beyond the removal of galleries and modern fittings, the opening out of flat plaster ceilings above which good timber roofs often lie concealed, the scraping off the accumulated layers of whitewash and paint, the letting in of light through blocked-up windows, the allowing of feet to pass through doorways closed in recent days by the mason or bricklayer, and the making strong of really perishing parts—all work beyond this is in great danger of destroying the traces of the historic continuity of our Church, and of doing a damage that can never be repaired. And in preserving the traces of this historic continuity, let it not be thought that any service is being rendered to history or religion by sweeping clean out of the church all fittings of a post-Reformation date. The sturdy Elizabethan benches (still remaining in several Derbyshire churches), the well-carved Jacobean pulpit, or the altar-rails of beaten iron of last century, should all be preserved as memorials of their respective periods; in short, everything that our forefathers gave to God's service that was costly and good should be by us preserved, provided that it does not mar the devout ritual ordered by the Common Prayer, or in other respects interfere with the Church's due proclaiming of her divine mission to the nineteenth century. The reaction against over-restoration is now happily setting in, but a word of caution is also necessary lest that cry should be adopted as the cloak of a lazy indifferentism, or be used as an excuse for regarding the parish church as a local museum, illustrative of bygone times, to be carefully dusted and nothing more. Where much new work or any considerable extent of refitting seem absolutely necessary it is best to hasten slowly, and to do a little well, rather than to aim at a speedy general effect.

THREE RECRUITS.*

MR. HATTON'S novel, though chiefly given up to villains, is yet meant to be to a considerable extent historical. He labours hard at his descriptions of the times in which he lays his scene; and, if he does not succeed in giving a picturesque account of the early years of this century, it certainly is not for want of effort. Unfortunately, he fails in accuracy. How inaccurate he is likely to be is, indeed, shown by the quotation, or rather misquotation, which has a page all to itself immediately after the title-page and the dedication. The following are the lines as given by him:—

O'er crackling ice, and depths profound,
With nimble glide the skaters play;
O'er treacherous Pleasure's flowery ground
They lightly skim and haste away.
JOHNSON.

Now this, of course, is utter nonsense. The poets of our day hesitate at very few things, yet even they would scarcely make skaters skim over flowery ground. But to put such an absurd image into Johnson's mouth is as gross a blunder as a writer could well commit. What Johnson wrote was as follows:—

O'er crackling ice, o'er gulfs profound,
With nimble glide the skaters play;
O'er treach'rous pleasure's flow'ry ground
Thus lightly skim, and haste away.

Mr. Hatton is not merely content with describing the time in which his characters flourished, but, by an artful contrivance, he manages in one passage to take his readers back another sixty years or so. Among his characters is an old woman who had passed her life in a town in Derbyshire. "If," he says, "she had lived in

* *Three Recruits, and the Girls They Left Behind Them.* A Novel. By Joseph Hatton, Author of "Clytie," "Cruel London," "The Queen of Bohemia," &c. 3 vols. London: Hurst & Blackett. 1880.

Fleet Street during her ninety years, instead of vegetating in that little cottage, she might have bought her tobacco and snuff at the very same shop as David Garrick," and done a great many other things, which she did not do, but which Mr. Hatton describes. This is certainly a strange way of writing a story, but, if it is pursued, care should at least be taken to make the things which the old woman did not see as true to history as possible. Now no one could have seen Oliver Goldsmith go into Richardson's office, as Mr. Hatton says, to read the proofs of Richardson's novels, as all Richardson's novels were published before Goldsmith entered his service. Possibly he might have read the proofs of some of the later editions; but where the evidence is found even of that we are at a loss to tell. At what time, we should like to ask, does Mr. Hatton think that Cobbett flourished? Among the other things that the old lady might have done, we read that "she might have bought from Cobbett himself a copy of his *Political Register*." There were other people living in 1811 besides people of ninety, as our author will find on consulting the records of those days, who might have made the same boast. In the account of this same year, 1811, we read that "a dreamer had already promised to illuminate the city with gas." As Pall Mall was lighted with gas from the year 1807, the dreamer was not so very wild in his promises. Perhaps, however, his difficulty lay, not with gas, but with the Aldermen. Mr. Hatton is happily still so young that doubtless the ancient days which he describes are so remote to him that they scarcely seem able to be distinguished one from the other. "I myself," he writes, "remember the Duke of Wellington a familiar figure in St. James's Park." What would he say were he to meet an old gentleman of our acquaintance who is still living who is wont to tell how he was greatly puzzled in his boyhood at suddenly hearing nothing more said about Sir Arthur Wellesley, while every one began to speak of Lord Wellington. He asked one of his schoolfellows what had become of Sir Arthur Wellesley, and was told that he had gone to America. But we are not at the end of Mr. Hatton's memories. "Only some dozen or fifteen years ago I was introduced," he boasts, "to George Stephenson's friend, Mr. Nicholas Wood." He can actually remember the friend of a man who has not been dead thirty years! He piles up wonders upon wonders. "I remember," he adds in the very next paragraph, "when the watchmen called the hours of the night; and so persistently are old customs maintained in England that at what is called the New Inn in Wych Street you may still hear the old cries to this day." In other words, he remembers that which can still be heard every night. The Cock Tavern, we learn further on, still exists; and, what is more remarkable, Mr. Hatton ate a chop there the other day. Before it is too late, we hope that very young children will be brought up from Derbyshire, and will have our author pointed out to them; so that, should they live to the age of ninety, they may be able to boast that they remember a man who ate a chop in the Cock Tavern in Fleet Street.

Mr. Hatton's style certainly does not assist his narrative in bringing before us the good old days which he describes. No writer of the year 1811, not even the dreamers among them, would have thought of such phrases as our author, in strict accordance no doubt with the usage of the present time, introduces. In those days there were no "moulting elms," no "terra incognito" (*sic*), no "faintest lilt of the pibroch in a girl's voice and manner," no "reliable persons," "no trees bursting into bronzed buds of leafy promise," and no "magnetic influence of the sanguine picture" drawn by a villain. Camps did not pulsate, men did not elect to be soldiers or anything else, and Englishmen did not talk of Napoleon but of Bonaparte. An earl was not addressed by his lawyer as "Your Grace," nor was it possible for a bracelet or anything else to be "literally welded with hot rivets." If metal was welded it was welded, and if it was riveted it was riveted, but the two processes were still as distinct in books as they are in the smithy.

We have only dwelt as yet on the defects of Mr. Hatton's story. We must now turn our attention to its merits. It is, we verily believe, more plentifully supplied with villains, and desperate villains too, than any three ordinary novels. Its incidents, moreover, are varied and thrilling. Highwaymen and murderers abound, and, as even their deeds might at last have a little too much sameness, the scene passes over to the war in Spain. Desperate charges are made, Frenchmen are cut down in the approved fashion, and an eagle is captured by the hero. This, however, is a mere interlude. It is with the domestic villains that our interest is chiefly concerned. The chief among them is a man of high birth, for he is the heir to His Grace—we follow the family lawyer in thus describing him—the Earl of Ellerbie. His Grace was no better than he should be. He had, indeed, "a most aristocratic appearance, whilst his wealth had become a proverb, and his family residence a mystery with a ghost in it." He had not the courage "to be exactly a villain, and so would encompass his end by craft and trickery." He had already been married twice, and had managed by a trick to gain the hand of the heroine for his third wife. On his wedding day, in accordance with the ancient custom of all Ellerbie bridegrooms, he went straight from the altar to meditate and pray at the tomb of an ancestor. The wicked heir, by no means approving of this marriage, came out of a heavy stone door among the tombs, which "seemed to have been hung as deftly as that of a modern iron safe, and moved in a similarly silent fashion of ponderosity," and cut His Grace's throat. No one could suspect him of the crime, for he had previously very artfully arranged that the news of his own death in the Peninsular War should be spread abroad, and that a monument should be set up to him in the parish church. He allows many months to pass before he appears on the scene, with a romantic tale of his escape from a foreign prison. The family lawyer had been his accomplice in the murder. The two villains would have succeeded in their plot, had it not most fortunately happened that a Bow Street runner had come into the neighbourhood in search of another murderer. He has his suspicions aroused, and in the end arrests His Grace. A certain dignity is cast on the concluding scene by the author's solemnly calling the villain three times in thirteen lines Philip Scruton, Earl of Ellerbie. When His Grace is at last safely lodged in gaol, he is not even then satisfied with his villany. He is troubled "in his heart with a palpitating, burning desire to beat to death" his fellow-prisoner, the family lawyer, who had given evidence against him. In attempting to gratify this desire he tumbles down from the third story of the prison, and is picked up "a hideous spectacle of death." A few months earlier another of the murderers had been killed, after a desperate fight, by a one-eyed soldier, whom he had waylaid on a dark night. The villain had fired his pistols at him; but we cannot pretend to do justice to our author's style in this part of his narrative, and so we shall let it speak for itself:—

> One of the bullets hit its mark, but the light of the flash showed the figure and attitude of the foe, and happily on the side of Tom's one active eye. Tom almost sprang out of the saddle as he fairly lifted his horse to the charge, and struck down the highwayman with one of those tremendous blows which had so often in the Peninsula demonstrated the value of that superior muscular strength which has carried the British soldier to the very height of his most ambitious hopes.

The haunts of highwaymen, mysterious tombs with a door that moves in a silent fashion of ponderosity, a crafty earl, a still more crafty heir to an earldom, and a family lawyer who is the match of both, are not enough, even with the help of the Bow Street runner, to satisfy our author. He adds, as we have said, the Peninsular War, and even then he has not had enough. He brings in, therefore, a secret society of Spain, a semi-religious brotherhood to which the wicked heir had belonged, and which had put him under its ban. Mr. Hatton seems to think that some apology may be needed for the introduction of such a society into a story the scene of which is chiefly laid in an English country town. He thus begins his defence:—

> A year or two ago, when Lord Beaconsfield in the House of Lords referred to the tremendous power of the secret societies of Europe, many people laughed at him. Perhaps they were right from their point of view, perhaps they were wrong; this is not a political novel (and I hold Mr. Gladstone's intellectual power in reverent admiration); but, since the Premier made that well-known speech, Nihilism and Socialism have come prominently to the fore.

We cannot say that the mysterious member of the brotherhood who now and then comes upon the scene really increases the interest of the story. He seems to play an important part; yet what it is that he does we had not patience to discover. He certainly adds to the general air of mystery and villany which in so high a degree distinguishes this tale, and perhaps he affords a pleasing contrast to the coarser ruffians. No less pleasing a contrast is afforded by a long dissertation on the farmer's wife of the present time and of the days of our grandfathers. Perhaps all that Mr. Hatton says on this subject is quite true. Certainly—though he is apparently too modest to mention his authority—it is all borne out by a speech which some young nobleman made, not many months ago, on this very subject. We should have liked to dwell at length on the charms and the fortunes of the three heroines—"the trinity of fair women," as the author calls them—but the limits of our space forbid. They all have a good deal to go through. One of them has her first lover hanged. The second has her husband murdered and her old lover arrested as his murderer. The third—the lady who has the faintest lilt of the pibroch in her voice and manner—is deserted by her lover for many a year, and suffers great hardships. Those of our readers who are interested in the fortunes of ladies such as these, and who have a strong appetite for the deeds of desperate villains, cannot do better than turn to the pages of Mr. Hatton's novel.

STRUCTURAL BOTANY.*

THE volume before us is the first of a new edition of *The Botanical Text-book*, the original edition of which appeared in 1842, and the latest in 1857. Since these dates much has been added to our knowledge of scientific botany. In his preface Professor Gray tells us that the present edition has been "entirely rewritten," and "the compass of the work extended," in order that it may serve as a text-book for a comprehensive and thorough study of botany. The volume which has now appeared is devoted to Structural Botany. Professors Goodale and Farlow, also of Harvard University, are to follow with volumes on Physiological and on Cryptogamous botany respectively; while a fourth volume by Professor Gray himself will deal with "the natural orders, classification, distribution, and products of phænogamous plants." The want of such a treatise on botany has been long felt, and the style in which this first volume has been executed leaves little to be desired as regards the "structural and morphological botany of phænogamous [or flowering] plants."

* *Structural Botany*. By Asa Gray, Professor of Botany in Harvard University. London: Macmillan & Co. 1880.

The words in brackets are our own, and this brings us at once to the one point of importance about which we are at variance with the author—namely, the preference given throughout the volume to recondite technical terms of Greek derivation over simpler words which have long been accepted by botanists to express certain features and theories, even though they may not describe with absolute accuracy the particular feature or theory. Such are "anthotaxy" for inflorescence, "phyllotaxy" for leaf arrangement, "teratology" for the study of monstrosities. It is true that the meaning and application of such terms is in each case carefully explained, and the reason for preferring the term given; but we question the advisableness of burdening the student with two sets of names, and the more elementary works will have probably accustomed him to the simpler names above quoted. Moreover, the majority of students of botany, as well as of the other kindred sciences, will probably have little or no acquaintance with Greek, and to such the Greek names will prove a very real stumbling-block. We lay the more stress upon this point because a very considerable experience of papers worked by botanical students of varied attainments and varied social position has convinced us that there is a real danger in such terms; they will convey no clear idea to the mind of the student, and will thus prove a great obstacle to progress. Those who use this text-book will, it is true, be advanced students, and in their case such errors will not result from its use as that of a beginner in elementary physiology, who lately told us on paper that the diaphragm in the human body was a "muskila tenderness" (muscular tendons?); but not the less will the result above described almost certainly take place.

Turning from this point, however, we cannot speak too highly of the exhaustive way in which the various heads of the subject-matter have been treated. The first eight chapters deal successively with the different parts of the plant, beginning with the development of the embryo from the seed, and ending with seed again. This part of the work abounds in very careful and suggestive teaching, and is copiously illustrated by excellent diagrams and references to the plants of all countries. Amongst many instances of this careful teaching we quote one or two. In speaking of Parasites in the chapter on the Root, the fact that such plants do not as a rule produce leaves is dwelt upon, and it is pointed out that, as the plant feeds on some other plant, and thus has its nutriment ready prepared, it needs no proper digestive organs of its own, and consequently does not produce leaves. "This economy is foreshadowed in the embryo of the dodder, which is a naked thread coiled in the seed and presenting no vestige of cotyledons or seed leaves. Having no need of herbage, such plants may be reduced to a stalk bearing a single flower or a cluster of flowers, or even to a single blossom developed from a bud directly parasitic on the bark of the foster plant." The most wonderful plant of this kind is the Rafflesia Arnoldi (fig. 80) of Sumatra, which grows on the stem of a kind of vine, and is a parasitic flower measuring nine feet in circumference and weighing fifteen pounds. Again, in speaking of the Stem, thorns are shown to be the result of a stinted growth, and attention is directed to the fact that such appendages are less liable to occur on the cultivated tree, when duly cared for, through the branches, which would in the wild state have produced them, having been thrown into a state of more vigorous growth. Further, in p. 64 the condensed stems of the Cactus family are shown to be an adaptation admirably suited to the hot, dry regions in which alone they are naturally found. "While ordinary plants are constructed on the plan of great expansion of surface, these present the least possible amount of surface in proportion to their bulk, their permanent spherical figure being that which exposes the smallest portion of their substance to the air." At p. 104, in the account of the structure of the leaf, we find the explanation of the "variable shade by the light, quivering aspen made" in the mechanism of its leaf-stalk, which, instead of being, as in most leaves, round, is flattened at right angles with the blade, so that the slightest breath of air puts the leaves in motion.

Some interesting facts are given in p. 83 as to the longevity of trees. We are told that some trees are known to have lived for one or two thousand years; the famous dragon-tree (Dracæna) of Orotava in Teneriffe, now destroyed by hurricanes and other accidents, had probably reached the age of more than two thousand years. Be this as it may, it is justly pointed out that the longevity of trees cannot be compared with that of animals, for the tree must be regarded not as an individual, but as a composite being or community, "in which successive generations are produced and die; no portion of the tree is now living which was alive a few years ago; it is the aggregate, the blended mass alone that long survives"; and an analogy follows with the way in which the coral insects build up their structure. The section on "leaves serving special offices" introduces us to the structure of some of those curious forms of leaves which appear to be specially designed for the assimilation of animal matter, such as the pitcher-plant, Venus's fly-trap, and, in a less degree, our own sundew; but for the details of this highly interesting branch of inquiry we are referred to the Physiological volume. The leaf-type theory, which supposes that the sepals, petals, stamens, and pistil are all homologous with foliage leaves, is well worked out. As the author expresses it, "What would have been leaves, if the development had gone on as a vegetative branch, have in the blossom developed in other forms adapted to other functions." The gradual transition from the sepals through the petals to the stamens in the water-lily is aptly quoted, and the study of monstrosities is made to furnish ample evidence in favour of the theory. Most of us have, for instance, met with a rose whose sepals were actually the compound foliage leaves of the rose, many with a leafy stem rising from the top of a pear; both instances of a reversion of the floral organs to foliaceous growth.

The chapter on "Adaptations of the Flower to the act of Fertilization" is one to which a reader will naturally turn in judging of the work; and here, too, we find the work exhaustive as regards the structural side of the question, though of course incomplete from the physiological side. The leading works on the subject have been carefully considered; the quaint and somewhat fanciful germs of the modern doctrine in Sprengel's *Das Entdeckte Geheimniss der Natur*, the numerous volumes and papers of Mr. Darwin on the subject, and the work of Hermann Müller. Kerner's *Flowers and their Unbidden Guests*, the latest work on the subject, had not reached the author in time, and no notice is taken of Sir J. Lubbock's book in the "Nature" series *On British Wild Flowers Considered in Relation to Insects*, a book which we think the more valuable because the author undertook his researches on the subject as an entomologist rather than as a botanist. In this chapter we were amused to find the following passage referring to wind-fertilized flowers. Speaking of the light pollen of the conifers, he says:—"Their pollen fills the air of a forest, and the 'flowers of sulphur,' popularly so called, the yellow pollen, which after a transient shower accumulates as a scum on the surface of the water several or many miles from the nearest source, &c." Many of our readers may remember a controversy in the pages of some of the scientific periodicals last year, when the phenomenon here described was attributed to we know not what agencies, natural and supernatural, before the simple truth was suggested, and the sulphur proved, by microscopical examination, to be the pollen of the larch.

Two more chapters fill the last hundred pages of the book—the first on Taxonomy, or classification, as we should have preferred to see it called, and the second on Phytography, under which title are included the nomenclature, description, and preservation of specimens. The chapter on classification has a good section on the principles of classification generally in natural history, which, amongst other things, discusses the theory of natural selection; here the author takes a slightly different view from Mr. Darwin. "In Darwin's conception variation does not of itself tend in any one particular direction; he appears to attribute all adaptation to the sorting which results from the struggle for existence and the survival of the fittest. We have supposed that each plant has an internal tendency or predisposition to vary in some directions rather than others; from which, under natural selection, the actual differentiations and adaptations have proceeded." Another section of the same chapter gives us a good historical sketch of botanical classification, from that of Cesalpini in the latter end of the sixteenth century, including the Linnæan system, and that of De Candolle, based upon the natural orders, with its most modern emendations by Hooker and Bentham. The chapter on phytography will be found full of information for the practical student, and forms a very useful addition to the treatise, which closes with a glossary of botanical terms.

THE COINAGE.*

AFTER all that has been written of late about the currency, it is strange to find ourselves directed by the highest possible authority to the oldest writer on the subject. The Directors of the Bank of England consider, they tell us in a short prefatory note, that they are rendering a service to the public by using some of the means at their disposal to republish Lord Liverpool's *Letter to the King on Coins*. It is seventy-five years since the book was originally printed, and the volume before us reproduces, perhaps a little too exactly, the peculiarities of its punctuation and arrangement. The editors say that suggestions have been made to them to continue the history of the currency from the point at which Lord Liverpool left off; but "it was felt that the history of the coinage would be more properly undertaken by the authorities of the Mint." We may perhaps indulge in a hope that these words indicate the probability that some such work either has been begun, or is about to be begun, by the "authorities" in question. It would indeed be no improper use of public money to pay for such a publication; perhaps the Directors of the Bank might again be induced to employ the "means at their disposal" for the purpose of disseminating just views on a subject of which nine-tenths of those who use money are completely ignorant. A mere annotated catalogue of the cabinet of coins now on view at the Royal Mint on Tower Hill would contain, when supplemented by the book just reprinted, almost all that is necessary.

Lord Liverpool was one of those fortunate men who, by dint of hard plodding, combined with a not too modest estimate of their own merits, contrived to obtain power, rank, and wealth under the early Kings of the house of Hanover. He lived "before the time when political success was deemed to be 'an ill-requited slavery mocked with the name of power.'" He was born during the last month of the reign of George I. At the age of twenty-nine he published a dissertation on the question of a standing army, and other political works of little importance at the present day.

* *The Coins of the Realm.* By Charles, First Earl of Liverpool. Reprinted. London: Effingham Wilson. 1880.

An election song, which unfortunately for our entertainment the editors only allude to in a dignified way, was the occasion of his first real advancement in life. Sir Edward Turner, who was partly indebted to young Jenkinson's muse for his success in contesting the representation of Oxfordshire, forced him on the notice of Lord Bute. He was speedily rewarded with one of those lucrative offices in which, whether he would or not, a man could not but accumulate wealth. In 1778 he became Secretary at War. In 1786 he became Chancellor of the Duchy of Lancaster, and a peer, by the title of Lord Hawkesbury, a title ten years later merged in the earldom of Liverpool. His first title became famous when it was borne by his son, afterwards Prime Minister; and as in his time Lord Hawkesbury, the son, was actually Master of the Mint, it may be presumed that the father had no difficulty in obtaining all the information required for the purposes of his work. It was written during his last illness, and he died only three years after its publication, "full of years and honours," say the editors with much truth, for he was eighty-one years of age, and had risen from obscurity to be an earl and to possess immense wealth.

His book is not adorned with any graces of diction, but is, even to a person already interested in the subject, extremely tough reading. It would have been well if the editors of this new issue had seen their way to furnishing it with an index. As it is, from the very nature of the work, Lord Liverpool was constantly forced to hark back, as it were, and to interrupt the flow of his narrative in a way which, without the help of any complete table of subjects, makes it extremely confusing. He begins with an account of the state of the coins of the realm on the accession of George III. in 1760. The deplorable condition into which it had fallen gives him occasion for the present letter to the King, in which he hopes some rules may be recognized which may prevent such deterioration from taking place again. The regulations of the Mint now in force are framed in precise conformity with the suggestions of Lord Liverpool, and "the existing laws limiting the issue of bank-notes were devised to remedy the evils to which he called public attention in his remarks on Paper Currency." After years of legislation, therefore, we may boast that the rules he laid down have been fulfilled, and that every branch of the circulating medium is "founded on solid, wise, and honest principles." The second chapter contains the definition of his technical terms, and starts with this sentence:—"The Money or Coin of a country is the standard measure, by which the value of all things, bought and sold, is regulated and ascertained; and it is itself, at the same time, the value, or equivalent, for which goods are exchanged, and in which contracts are generally made payable." He proceeds to notice in subsequent chapters the imperfections to which, as a standard measure or equivalent, coins are subject, and the necessity, on which he repeatedly insists, of making such coins as are to be taken as the chief measure of property in one metal only. Further on, after an historical account of the fluctuations in the value of money in England, he makes a comparison of the relative values of gold and silver, showing that, while silver has constantly fluctuated, gold has varied but little, and is therefore the best standard. A disproportion between the values of gold and silver causes the fluctuations of the money market, and so little were these things understood before the time of Lord Liverpool, that he records several occasions on which Ministers were alarmed by great scarcity of certain kinds of coin. Sir Isaac Newton at one of those conjunctures showed them that silver coin was exported because the guinea, which was really only worth 20s. 8d., passed for 21s. 6d. Lord Liverpool next goes into a detailed account of the attempts made to debase the coinage—"a convulsion in the monetary system, which never happened in this kingdom, except in the short period from the 34th Henry VIII. to the 6th Edward VI." In France the coinage was frequently debased, and Henry VIII. followed the bad example in 1543. At his death, in 1547, the so-called silver money was two-thirds alloy. The plunder of the monasteries had not greatly enriched him when he was reduced to these dishonest expedients, nor did things much improve, apparently, during the reigns of Edward VI. and Mary. The necessary consequence was, as Lord Liverpool points out, that enormous profits were made by exchanging silver for gold at their nominal values, and all the gold coins were in a short time either hoarded, melted, or exported. There is a curious passage in King Edward's journal on the subject, and Stowe, the historian of London, records his recollection that twenty-one shillings current was given for an old gold angel "to gild withal." All commerce came to a stand. Farmers would not bring provisions to market, for they did not know what price to put on their produce. The distress occasioned must have been extreme. Proclamations were made in vain; people would not be forced to bring their corn and meat to a sale, even under severe penalties. Parliament "passed laws for regulating the manner of buying and selling all sorts of beasts and cattle, as well as butter and cheese, and for limiting the prices at which all sorts of wine should be sold." But it was of no avail, nor were the further enactments against "regraters, forestallers, and engrossers." At length the only true remedy was applied, and "it is extraordinary," remarks Lord Liverpool, "that the Ministers of this Prince, who had hitherto committed such gross errors in debasing the Coins of the Kingdom, should instantly adopt principles which led to a system, not perfect indeed, but as nearly perfect as any to which the other nations of Europe have hitherto attained in their Coins." Before the death of the King the reform was in part executed; and during the reign of Queen Mary, though nothing further was done, the public inconvenience was not so great. Queen Elizabeth, though counselled on her accession to follow the bad example of her father, accepted the wise advice of Burleigh, and caused a thorough reformation of the coinage to be carried out, an act which, perhaps more than any other, insured her early popularity. Parliament hastened to congratulate her upon it. After the reform of religion, this is her chief title to the admiration of posterity, according to the epitaph on her monument in the Chapel of Henry VII. She sent base coin, however, to Ireland, to the great inconvenience of traders; and at the very end of her reign she walked in the way of her father and brother, but only to a limited extent.

In the chapters which follow there is an exhaustive account of the "seigneurage" taken by various kings for making coins. In France down to the Revolution the seigneurage was a considerable source of revenue. In England it was abolished by Act of Parliament in the reign of Charles II., when a pension charged upon this tax, granted to Barbara Villiers, had to be provided for specially. The history of our coinage is traced from the first; and the alternate predominance of gold and silver as standards of value is pointed out. Lord Liverpool is distinctly against "bi-metallism," as it is now called; and argues strenuously against Locke, who held that gold was not fit to be the money of the world and measure of commerce. The principle laid down is a simple one. "Coins should be made of metals more or less valuable, in proportion to the wealth and commerce of the country, in which they are to be the measure of property." It is a curious fact, as here adduced in support of the proposition that gold is the proper standard of value in England, that the value of silver at the time of the Norman invasion was nearly as great as that of gold at present. Silver was then the only money in currency. A pound of gold is, compared with the present prices of commodities, of about the same value as a pound of silver in the eleventh century. Henry III. was the first to issue a gold coinage. There is an interesting chapter on the variations in the comparative value of gold and silver, from which it appears that, though gold remains, and has remained for centuries, at about the same price of 3*l.* 17*s.* 6*d.* to 3*l.* 17*s.* 10*d.* an ounce, silver varied in one year—namely, 1797—no less than 9½ per cent. The recent depreciation of silver is another example in point. There is a good deal in the book on the methods of assaying, of calling in light coin, and of governing the Mint so as to insure its efficiency at the smallest possible expense; and Lord Liverpool concludes with an essay on the relative values of gold and silver among the principal nations of antiquity. The proof of the soundness of his views consists in their virtually universal acceptation now after so many years, and the authorities of the Bank have certainly conferred a benefit upon the public by reprinting them.

NASMITH'S INSTITUTES.*

We must confess ourselves puzzled by this book. In the first place, the period of its literary gestation has been portentously protracted, extending over seven years. Of the four volumes which comprise these Institutes, the first was published in 1873, the second and third in 1875, and the fourth last year. One cannot help being reminded of the dilatory manufacture of Master Tom Ingoldsby's shirt as related in the *Ingoldsby Legends*, and though we will not say that a similar catastrophe to that which befell that famous garment would be the fittest fate for Mr. Nasmith's tardily evolved work, we cannot but fear that ultimate inutility will be the only alternative for the book as it would have been for the shirt. *Nolumus leges Angliæ mutari* is a very pretty conservative sentiment; but laws do change notwithstanding, and seven years effect well nigh as great an alteration in the constitution of the legal system as the same period is reported to work in that of the human system. So that all through Mr. Nasmith's book one has a painful feeling of being a day, or rather many days, after the fair, an impression as though the work were an old edition out of date, picked up cheap on a second-hand bookstall, a distrust whether what he says is still true, or whether it has not been altered by subsequent decision or statute. Law is proverbially a tardy science, still it manages to get along a step or two in the course of seven years; and so, whatever might be the value of these *Institutes* from an antiquarian point of view, as a practical guide they are obviously worse than worthless, inasmuch as they are apt to mislead. Mr. Nasmith says in the preface to the last issued volume, in which he proudly announces the completion of his *magnum opus*, that he has endeavoured to supply the existing want of "a well-defined outline of the entire province of Law"; and he adds:—"To what extent I have succeeded the student of English law who takes the trouble to learn what there is in these volumes will be the best able to judge. I venture to think that he will not find the time devoted to their careful perusal ill spent." With the first proposition we agree, inasmuch as no one can well form a judgment how good or how bad a book is until he has read it; from the second we sorrowfully, but entirely, dissent. No doubt from a bad book, as from a bad sermon, something may be learnt; but, considering how short life is, we cannot think that time spent by a student in a careful perusal of Mr. Nasmith's work, especially if the student took as long

* *Institutes of English Public Law.* By David Nasmith, LL.B., of the Middle Temple, Barrister-at-Law. 4 vols. London: Butterworths.

as the author has taken to write it, would be time well [illegible].

Fortunately the first of Mr. Nasmith's volumes deals with matters less immediately affected by lapse of time than others of which he treats. It professes to contain what Mr. Nasmith, following a classification adopted by Bentham and others, calls "Public Substantive Law," by which we are to understand the legal principles which the Courts are established to administer in relation to matters other than private contracts between individuals. But Mr. Nasmith seems in no hurry to get to his actual subject. Possibly, anticipating the lengthy period he has devoted to his book, he thought he might at any rate begin at the beginning; and so, before we reach anything like law, we have to wade through long disquisitions on the human understanding, schools of moral theology, happiness, and other immutable principles, with copious—very copious—extracts from Locke, Bentham, and Austin, and it is not till page 33 that we get even as far as Adam and Eve, with regard to whom Mr. Nasmith goes out of his way to give a feeble dig at Mr. Darwin which may have been admirably effective in 1873, but is a little out of date now. We cannot refrain from reproducing some small portions of Mr. Nasmith's extraordinary picture of Adam and Eve, in the character of the originators of a legal system, as affording a good illustration of Mr. Nasmith's redundant fancy, and the very fine language he sees fit to employ when exercising that fancy. "Beginning then, at the beginning," he says, "it may not be without profit briefly to consider Adam and Eve as the first human pair and their family; assuming for the moment that, whether the reader is disposed to accept our Scriptures as of authority or not, he at least rejects the humble origin assigned to us by a modern philosopher." We pass over a glowing picture of the beauties of Paradise and a general description of Adam and Eve, as having been much better done by one John Milton from a literary point of view, and as having in no conceivable way anything to do with law, and we come to a few of Mr. Nasmith's choicest conceits with regard to the amount of law which he represents Adam as having evolved from his consciousness or observation:—"However he may have comported himself towards his children, the relationship between himself and his wife laid the foundation in his mind of the doctrine of contracts, matrimony being the first example. Nor could he have contemplated that contract and the relative position of the parties to it without realizing the fundamental principles of agency." Breathless with endeavouring to follow Mr. Nasmith's daring flights of fancy, we can only gasp "Why agency?" The usual, if not the only, way in which husbands become acquainted with the law of agency through the medium of matrimony is by being made liable for their wives' bills; and though we cannot doubt that Eve, if her acquisitiveness was anything equal to her husband's, soon improved on the primal coat of skins and acquired a taste for dress and finery, there could scarcely at that period have existed shops wherein she could indulge that taste at the expense of Adam. But to proceed:—"Nothing would be more unreasonable than to suppose that the life of the first family was a scene of unbroken concord and harmony." Here we quite agree; there is direct testimony that a very serious breach of concord and harmony, amounting in fact to murder, occurred at a very early period; yet somehow Adam does not appear to have taken cognizance of it—perhaps his legal instincts were not then sufficiently developed—"but, if it was not, the duty devolved upon Adam to settle and adjust the disputes among his children, and his attention was therefore necessarily directed to the fundamental principles of the administration of justice; nor could the value and different qualities of evidence have failed to strike him. If among these disputes, as is most probable, he was called upon to settle a question of defamation of character, it is not unlikely that from his rude judgment-seat he expounded in a forcible and intelligible manner the destructive tendency of that wrong." This is really too much; the mind conjures up a picture of Adam delivering an able judgment in a case of libel by a primeval society journal; one would scarcely have been surprised had Mr. Nasmith gone on to suggest that Adam was not unacquainted with horsehair wigs, and usually summed up for heavy damages in cases of breach of promise of marriage.

We cannot possibly go in equal detail through all Mr. Nasmith's four volumes, or even any one of them. The first, beyond the before-mentioned philosophical disquisitions, contains a brief sketch of constitutional history from the eleventh to the nineteenth century; a treatise on international law, which is really rather good, though it sounds somewhat quaint in 1880 to hear of "the horrors of the late Franco-Prussian war," and a chapter on English municipal law—enough in all conscience for one small volume. Mr. Nasmith has, however, a marvellous knack of compression; though sometimes he compasses brevity by a process which looks rather like jumping at conclusions—as, for instance, in two pages of not over-perspicuous argument he arrives at the conclusion "that every species of luxury and sumptuousness indulged in by those who have the means to secure them is a positive benefit to the State." Again, accuracy is somewhat sacrificed to conciseness when he states that "punishments are of two kinds, restraint of liberty, *i.e.* imprisonment, and fines." Even so long ago as 1873, we believe, hanging and flogging were not unknown to retributive justice. Mr. Nasmith goes elaborately through the present system of criminal law and bankruptcy; and, judging from the present prospects of the Criminal Code and the Bankruptcy Bill, it seems not impossible that his book may for awhile afford a reasonably accurate description of the existing state of law on these points; but new brooms sweep clean, and a new Parliament may still further detract from the value of the work by passing the long-contemplated measures.

Two volumes contain Mr. Nasmith's views on private law, or the legal status and relations of individuals, as to which we need only say that the treatment of the subject is rather below the level of the accepted text-books, while the lapse of five years since the publication of this instalment of the work necessarily lays it open to criticism on the ground of inaccuracy, and renders it absolutely useless as a book of reference by reason of the omission of all recent cases. Indeed Mr. Nasmith seems to have a predilection for old cases in preference to new, and it is quite remarkable how rarely in his pages we find references to the *Law Reports*, the universally accepted series since 1866.

Lastly, in 1879, comes the volume containing "Adjective Law," divided under two heads, "Evidence" and "Damages." And here we are glad to be able to say that the scheme of the treatise on evidence is distinctly good, inasmuch as it classifies legal fictions, rebuttable and conclusive presumptions, matters of which no evidence is admissible, and those of which no proof is needed, in a manner more calculated to impress the nature and distinctions of these subjects on the mind of the reader than that usually adopted by text-writers. But of the accuracy with which Mr. Nasmith has carried out this portion of his task we cannot speak in terms of praise. Possibly he wished to make his work as a whole consistent in point of time, but he certainly omits to notice recent changes in the law in such fashion as to leave us only the choice between two conjectures—either that this volume is older than it looks, or that Mr. Nasmith has been so occupied with its production as not to have had leisure to read his law reports for the last few years. For instance, if his view of the relative provinces of the judge and jury, as given at pp. 28 and 102, be the correct one, all we can say is that the House of Lords decided the case of Jackson and the Metropolitan Railway wrongly. But, as Mr. Nasmith omits to notice that important case, even for the purpose of exposing its fallacy, we may be pardoned for supposing him unacquainted with it. At p. 98 Mr. Nasmith speaks of arrest on a writ of ca-sa. We thought that this process had been abolished. We forbear to search for further instances, and can only say that, on referring to the index of cases given at the beginning of the volume, it is astonishing to see how many leading and well-known decisions are conspicuous by their absence. Mr. Nasmith regrets that he has "not been able to add a section on Procedure out of Court." We cannot honestly share his regret. We are sorry to have to say it, but we do not think the book sufficiently good for it to be worth Mr. Nasmith's while to expend more time on it. Standard institutes and commentaries exist which are not to be supplanted by the works of any but a very strong author; treatises on evidence and damages exist of scarcely less authority; and the frequent editions of these works, which are brought out by competent editors, leave but little room for a book such as Mr. Nasmith's.

MINOR NOVELS.*

THE first attempt in fiction of a writer so favourably known in other directions as the author of *The Gamekeeper at Home* naturally has a peculiar interest, and it may be safely said that, in spite of certain shortcomings, which are apparent if *Greene Ferne Farm* is to be judged by the high standard suggested by the writer's previous successes, the expectation aroused by a knowledge of his other works will not be disappointed. By casting his interesting and truthful descriptions of scenery and people into a narrative form Mr. Jefferies gets opportunities which he might otherwise miss, while at the same time he incurs responsibilities to which he is not always equal. To say this, however, is merely to say that, regarded as a novel, *Greene Ferne Farm* is not perfect. It fails where it might perhaps have been expected to fail, in the matter of plot. There are, however, many successes to set against this failure. Most of the characters, whose adventures are contained in the space of one volume of moderate length, live and impress a sense of their reality upon the reader. We feel as we put the book down that we know "Tummas" and "Rause" perfectly well, although we have only been given two brief glimpses of their curious courtship. The descriptions are admirable. Mr. Jefferies combines a poetical instinct with a faculty for close and accurate observation, and the result is the really fine descriptive writing of which we have so many wretched pinchbeck imitations eked out with meaningless mouth-filling words. Of humour in the sketches of country character there is of course plenty, and, as we have hinted, the personages who only appear quite casually on the scene are as well hit off as the more important characters, better indeed than some of them. There is one little scene of this kind which is particularly good. One of the gentlemen overtakes an old woman plodding along with a large bundle of gleanings on her shoulder and a heavy basket on her

* *Greene Ferne Farm.* By Richard Jefferies, Author of "The Gamekeeper at Home," &c. London: Smith, Elder, & Co.

Countess Daphne; and Other Tales. By "Rita." 3 vols. London: Sampson Low & Co.

arm, of which he relieves her. "You seem to have a heavy load," he says,

"I ain't got half a bundle," she grunted. "Thaay won't let a pore old body glean when a-can't rip."

"Well, it's beautiful weather for the harvest."

"Aw, eez—the het [heat] makes um giddy: our ould Bill fell down; the gearden be a-spoiling for rain."

"The farmers pay good wages now, don't they?"

"Um pays what um be obliged to."

"You have a good landlord here—Squire Thorpe."

"*He!* Drotted ould skinvlint! You go and look at thaay cottages: thaay be his'n."

After this fashion she goes on abusing violently every one, gentle or simple, whose name is mentioned to her. When she is left alone again she first says, "What, bean't you going to carry that basket no furder?" and then asks for a bit of snuff. Having been presented with a shilling she put it in her pocket, "readjusted her burden, and tottered on, muttering to herself, 'The gurt chattering fool to come a' hindering I!'"

It is to be regretted that there seems to be less life in some of the principal than in the subordinate characters. Margaret Estcourt and the two young men, Geoffrey Newton and Valentine Brown, whose old friendship is marred by their both being in love with her, are less clearly drawn than are either old Andrew Fisher, Squire Thorpe, Felix St. Bees, the hard-working and popular clergyman who sticks to his trying work from sheer love for it, or Augustus Basset, the wreck of an educated man, who is a kind of half bailiff, half hanger-on at the Farm. We have no objection to make to the plot of the book turning upon a thin love story, admirably relieved as it is with such touches as we have indicated, and with an admirable description of a night adventure on the downs. But we may fairly object perhaps to the quasi-sensational scene towards the end of the book, in which the two rivals, out shooting together, suddenly fall into an unpremeditated duel with their guns. Mr. Jefferies remarks, it is true, that if they had been using muzzle-loaders the thing could hardly have happened; but we doubt if the excuse of the rapid loading is sufficient; nor, granting thus much, is it credible that one should take advantage of the other's having fired away his last cartridge. This, however, is the only serious blot upon a book which has many admirable qualities. We have said something above of "Tummas" and "Rause." This is the end of their courtship:—

"Aw, thur be the moon, you; a' be as big as a waggon-wheel," said Tummas, putting his arm as far round her plump waist as it would go.

"Let I bide," said Rause.

"I wooll kiss ee," said Tummas sturdily.

"Thee shatn't."

There was some struggling, but Tummas succeeded with less difficulty than he expected. The damsel was relenting under the influence of long and faithful attentions. Tummas, like a wise man, hit while the iron was hot, and pressed for the publication of the banns.

"Aw," said Rause, at last, with a finished air of languid weariness, as if quite worn out with importunity, that could not have been much improved on in a drawing-room, "aw, s'pose us mid as well, you. If thee wout do't, *I* can't help it, can 'ee?"

"Rita's" volumes, which contain *Countess Daphne* and two shorter stories, strike us as a curious example of imitativeness. The writer has apparently modelled her style upon that of a notorious contemporary author who has lately succeeded in obtaining a disgraceful puff in the *Times*; but it would be hardly fair to quote of "Rita" the old line about an "exemplar vitiis imitabile," for, however much want of wisdom and unlucky attempt at fine writing there may be in "Rita's" productions, and however bad may be the taste of some passages, they at least are not so offensive as the works on which she seems in other respects to have founded her method. The story of *Countess Daphne* is supposed to be related by two fiddles, and it will be conjectured from this that music has a large share in the tale. It is not so very long ago that we commented upon the small number of good musical novels which exist in English, and we fear that *Countess Daphne* cannot be added to this number. The materials of the plot are a musical boy of obscure parentage, taken up and protected by an accomplished musician and violinist; a musical girl whose birth is a mystery, and who is a playmate of the boy; and the musician referred to, who in after life finds that his *protégé* is his rival in the girl's affections, or rather that, unless he gets his *protégé* out of the way, he can never hope that she will listen to him. The girl Daphne, when she is brought to think, by the musician Delli's contrivance, that her boy-lover is untrue to her, makes a loveless marriage with Delli; and the author might with advantage have omitted a great deal of what she has written in this connexion. In such matters as this, however, she is fortunately, as we have hinted, not "a patch upon" her model. Delli succeeds finally in winning Daphne's love, and meanwhile Tista, the boy-lover, whose genius, unprotected and unsupported, has been unable to assert itself, is ill and starving, with no friend but another girl who has fallen in love with him. This girl, who is an actress, is taken up by Countess Daphne (she turned out to be a Countess before she married Delli), and procures an invitation for Tista to play at one of her parties. When the two meet there comes, of course, an explanation, and the discovery that Delli had separated the lovers by the familiar device of suppressing the letters which they wrote to each other. Tista plays, with extraordinary success of course, and dies just as he comes to the end of his piece. The curious thing is that, after all this, Countess Daphne, like a well-conducted person, seems to like her villanous husband rather better than before, and tells him that she "can pardon all for love." "Does Daphne seem a feeble heroine after all?" asks the author; and the only possible reply is, "As you put it in that way, she most undoubtedly does." The author, it may be noted by the way, is hardly fortunate in the headings to her chapters, one of which is taken, according to her, from "Elaire's song in *The Princess*."

Another of the stories is called *Only an Actress*. The actress is a certain Miss Irene Vernon, beloved by and betrothed to Lord Montdesne. Lord Montdesne has a sister who "is a beautiful, proud woman, and moves in very high society." Perhaps it is on account of the exceeding height of the society that she is called indifferently Lady Cissiter, Lady Otho, and Lady Otho Cissiter. "She" (Lady Cissiter, or Lady Otho, or Lady Otho Cissiter) "married a very rich nobleman, her senior by thirty years, and they are wonderfully rich, and perfectly—unhappy. But for all that Lady Otho moves in her own distinguished circle, unruffled and unmoved either by her husband's neglect or infidelity." This three-named lady who moves in a distinguished circle although her husband is a wicked old man, calls on Miss Vernon, and hearing from her that she is to be Montdesne's wife, replies, "*His wife!* Are you mad, girl? His mistress, perhaps—nay, even that is too much honour!" The end of all is that Miss Vernon dies on the stage, just as the hero of *Daphne* dies in a concert-room. "'I loved him as a woman loves but once,' she said, in the words of the written piece, and the words of her own desolate heart. 'I gave him all—my thoughts that were the echo of his own,'" and so on. When she had finished these "words of the written piece," a "hoarse, choking sob fell across the dense and solemn silence—a man's sob." Oddly enough, considering the density and solemnity of the silence, "she heard it." And after that she "wailed 'My love.' And straight across the darkened stage she fell—dead." There is some use after all in such writing as "Rita's." It makes us appreciate more keenly such books as *Greene Ferne Farm*.

AMERICAN LITERATURE.

No more interesting historical work has been published in America for some time past than the Memorial Volume of the Army of Northern Virginia (1), that army which, under the command first of General Joseph Johnstone, afterwards of General Lee, maintained for four years the cause of the Southern Confederacy against overwhelming odds, and concentrated upon itself during that period the attention of the civilized world. The military lessons of its campaigns may perhaps not possess that technical value which attaches to many struggles less momentous and eventful and to exploits less heroic. The conditions of the conflict were exceptional, and can hardly be reproduced. On neither side did the troops engaged possess the discipline or the permanent organization of regular armies. But the very circumstances which render the story less useful to the mere military student enhance its historical and moral interest. It was a war not of armies, but of nations; not of professional soldiers, but of citizens fighting on either side for great principles. It was a struggle for national grandeur on the one hand, and for national existence on the other. Every soldier in the Southern army, with the great majority of those who formed the overwhelming forces of the Union, felt a keen personal interest in the struggle, and was affected by its fortunes almost as deeply as a Spartan or an Athenian by the fate of those wars which, despite their small scale and limited area, will be studied and remembered for ages by millions for whom the great European conflicts of the sixteenth, seventeenth, and eighteenth centuries will possess but a secondary interest. For Englishmen especially, the story of the American Civil War must always possess the most powerful attractions. On both sides the principles involved were those which most deeply affect our own national feeling; the language, the race, the ideas of the combatants were our own. The army of Northern Virginia in particular, from the nature of the defence it had to maintain, and the character it earned and sustained, enlisted, and will for generations continue to enlist, the strongest English sympathies. It fought with English tenacity, English recklessness of consequences, English indifference to odds, what was from the first a very doubtful and soon became an evidently losing battle. Once only was it fairly beaten in open field; over and over again, both on the offensive and on the defensive, it proved itself more than a match for apparently overwhelming odds. Its composition resembled very closely that of our own Volunteer regiments. Its chiefs were men whose personal character and public conduct displayed all the virtues on which Englishmen most pride themselves; as the people of Virginia are perhaps the most thoroughly English of all the many offsets which the mother race has planted in every part of the world. General Lee was as perfect a type of the ideal English soldier and gentleman as history can show. "Stonewall" Jackson reproduced, with many of its eccentricities, but scarcely one of its worse and meaner features, the historic character of the Puritan leaders. Stuart, Fitzhugh Lee, and Wade-Hampton reminded those who closely followed their career of the finest examples of English Cavalier loyalty and simplicity. Longstreet and A. P. Hill were thorough English country gentlemen, whom duty converted into generals, and who proved themselves second to no veteran soldiers in skill, judgment,

---

(1) *Army of Northern Virginia; Memorial Volume.* Compiled by the Rev. J. W. Jones, D.D., Secretary Southern Historical Society. Richmond: Randolph & English. London: Trübner & Co. 1880.

daring, and devotion. The splendour of its achievements and its endurance, the personal qualities and the fate of nearly all its chiefs, give an especial pathos to the heroism of the Virginian army. The present volume begins with the record of the meeting of November 3rd, 1870, when those who had fought under him, and those who had in civil or military capacities supported him, assembled to pay the last honours to the memory of a leader adored as few soldiers have been adored by all his countrymen, revered by every man among his enemies whom passion and spite had not rendered incapable of generosity, and respected and admired by the whole of Christendom. On the next day the first formal reunion of the Virginian army took place. Since then in each year the Virginian division of that army has held an annual meeting. Prudence rendered the first two assemblies comparatively private, and no record of their proceedings has been preserved; but on the third occasion the vindictive feeling of the victorious section had so far subsided that it was thought safe to publish the proceedings. In these no characteristic is so remarkable as the utter absence of that bitterness which might perhaps have been looked for in the vanquished party. There is scarcely a remark in all the speeches, scarcely a word throughout the whole volume, of which any Northern soldier could complain. The addresses, one of which forms the principal feature of each annual reassemblage, possess a very high historical as well as military value. That of Colonel Venables on the campaign of 1864 from the Wilderness to Cold Harbour; that of Colonel Marshall, General Lee's aide-de-camp, on the strategic value of Richmond; that of Major Daniel on the critical battle of Gettysburg; that of Captain McCabe on the defence of Petersburg; that of Colonel Allen on Jackson's exploits in the Valley of Virginia; and that of General Fitzhugh Lee upon the victory of Chancellorsville, when the Confederates attacked, outflanked, and utterly defeated an army more than twice as strong as their own, are all thoroughly excellent in their way. That of private Leigh Robinson on the battles of the Wilderness is full of interesting observation and incident, but fearfully too long. To many readers to whom they will recall scenes watched from a distance with eager interest, to a younger generation which will derive from them its first clear notion of one of the most heroic struggles on record, this volume will be most acceptable. Were we required to indicate any one portion of the collection as especially typical and interesting, we should perhaps name Captain McCabe's account of the defence of Petersburg, unless we gave the preference to the terrible six days' retreat, the last episode of the war, and one in which the peculiar merits of the Virginian army were displayed with singular clearness. As a contribution to the history of the war the work is invaluable, so far as it goes. Most, if not all, of its contents have already appeared in the papers of the Southern Historical Society, papers far less generally known in this country than they deserve, and which contain such a mass of authentic information and vivid description from the Southern point of view as does not, we believe, exist respecting any other great national conflict.

Mr. A. P. Russell's *Library Notes* (2) are sadly incoherent, and, we incline to think, very ill arranged; the titles of the various papers affording little or no clue to the character of their several contents, and each being far too long and varied. Had the volume been broken up into six or seven times as many distinct chapters, with the materials of each clearly arranged and connected by some continuous thread, the work would have found and deserved a very much larger circulation than in its present form it is likely to enjoy—might have taken a permanent if humble place in that class of works to which the *Curiosities of Literature*, Coleridge's *Table Talk*, and *The Autocrat of the Breakfast Table*, different as they are, may all be said to belong. It is a book into which a careless reader may dip at any point with the assurance that he can hardly turn two pages without lighting on something readable and rememberable; but it is also one which the most diligent and omnivorous student can hardly by possibility read through. We have found in it many stories which, true or not, are new, at least to us; some perhaps which are true but not new; and a fair number which have neither truth nor novelty to commend them.

Mr. Henry George's work entitled *Progress and Poverty* (3), a somewhat ill-chosen name, selected probably for its alliterative suggestion of much more than the work really contains, would have been very well worth reading had it been compressed into half its actual length. As it is, with a good deal that is not sound—especially when the author attempts to reason from particular facts to general conclusions—it contains much that a practical economist is very apt to overlook. Till we read Mr. George's chapter on Wages we had hardly realized the extent to which acute thinkers in whom the faculty of generalization surpasses that of appreciating and ascertaining facts—even such a writer as Mr. J. S. Mill—are biassed in their general inferences by particular facts, or perhaps we should say by that practical aspect of a subject with which personal or national experience has familiarised them. It is hardly too much to say that Mr. George's general conclusion is not much more widely wrong than Mr. Mill's. From the American aspect of the question, from his familiarity with a multitude of cases in which wages are paid out of or by a share in produce, Mr. George lays down the general rule that wages are never paid out of capital, as, from his familiarity with an exactly opposite set of facts, Mr. Mill laid down an almost equally general rule to the contrary. A little reflection might have shown the younger writer that in contradicting his predecessor he has fallen into a precisely analogous error. Where wages are paid before produce is sold it is plain that they are paid out of capital, if only from the obvious fact that the capital of the employer must suffice not only for the purchase of machinery and raw material, but for the maintenance of the workmen for weeks or months. Similar merits and similar faults are almost as strikingly displayed in the author's treatment of the cognate questions of Interest and Profits. He shows, for example, how the so-called "tyranny of capital" is sometimes a real and very exasperating fact in the United States, though in a form with which Englishmen are happily but little acquainted—a Railway Company, for example, imposing on individuals and on towns terms outrageously unjust, but enforced by a power derived not from capital but from monopoly. He fails, however, to see that the true deduction to be drawn is not one adverse to capital, but one condemning the carelessness with which unregulated and unconditional monopolies are granted by the State and Federal Legislatures. The value of Mr. George's book lies in the presentation of views derived from the peculiar facts of American industrial and social organization; views which may lead thoughtful European economists to modify the generality of their own conclusions rather than to adopt Mr. George's.

Dr. Allen's work on Solar Light and Heat (4) is not one which can be criticized in a brief notice. Its purpose is to draw from facts which are broadly, if not always correctly, stated, and from assumptions which will not by any means be universally admitted, inferences respecting the identity of natural forces and the sensations they produce which transcend anything yet attempted by the most advanced scientific theorists. But that the sensations of light, heat, smell, taste, and sound are produced by an identical electro-magnetic action transmitted through different nerves, is a conclusion as hasty and premature, to say the least of it, as that the original cause of motion must be immaterial by logical deduction from the inertia of matter. These are two of the main doctrines or assumptions of the author, and from these the trustworthiness of his reasoning may be judged by those who may not feel themselves equal to criticize his arguments in detail.

The *History of Bristol Parish in Virginia*, by Dr. Slaughter (5), is certainly disappointing. It contains very little of that primitive local history, derived from parochial records, which throws so much light on the early proceedings of the first English colonists in America before the settlements had acquired a security that afforded leisure and opportunity for regular accounts of the general progress of the colony as a whole. Grains of valuable information are scattered here and there, but they have to be picked out of a mass of material that possesses scarcely more interest outside of Bristol parish itself, than would the short and simple annals of a Kentish or Devonshire church during the same period.

Mr. Townsend's *Tales of the Chesapeake* (6) are lively, often readable, sometimes sensational, but sometimes unsuited from the character of their interest to youthful readers, while hardly adapted to the better taste of maturer years.

The American Art Review (7) of which the fifth number is now before us, is somewhat too technical for any but artists or professed connoisseurs. It contains, however, several engravings which appear to possess no common merit, and more than one interesting paper, the most valuable one being that on the peculiarities of American art, of which only a fragment appears in the present number. The critic charges his countrymen with a want of imagination and a tendency to almost Chinese imitativeness—a charge which till lately was preferred, not wholly without reason, against the national literature also. The paper, type, and general execution are well worthy of the subject and of the pretensions of the review.

Mr. Brock's work on the manufacturing and trading importance and prospects of Richmond (8) is little more than a pamphlet, published, no doubt, with the patriotic purpose of attracting towards the capital of the Old Dominion the wealth and labour that may in some measure repair her terrible losses. The energy and resolution with which the Virginians have exerted themselves to restore the fallen fortunes of their State, and the loyal frankness with which, both as a community and as individuals, they have accepted the situation and endeavoured to make the best of it, deserve all possible sympathy. Two serious obstacles stand in the way of their success. The demoralization of negro labour is probably less felt there than in other Southern States, but the

tobacco cultivation has exhausted much valuable land that cannot recover its productiveness without expensive manures which its owners can ill afford; and the failure, despite the efforts of all her best and worthiest citizens, to pay the State debt necessarily discourages that influx of English capital which might afford her the best chances of recovery. The Valley of Virginia certainly offers special attractions to agricultural emigrants. The society of the State is to Englishmen the most congenial in America, but Richmond itself is, we fear, hardly likely to attract any considerable addition either of capital or labour from without.

The fifth volume of Dr. Furness's *Variorum Shakspeare* (9), containing *King Lear*, deserves mention as an example of the American interest in English classics, and of the spirit with which publishers like Messrs. Lippincott endeavour to meet its demands, and even to raise its standard.

A mention, if no more, is due to Miss Charlotte Bates's small volume (10), a collection of short and often spirited and graceful pieces of verse.

Blue-books are hardly literature; and though an exception must be made in favour of not a few publications which in America are issued at the expense of the State or Federal Governments, and not, as in England, at the cost of author or publisher, the general rule applies there as elsewhere. A document like the Annual Report of the Massachusetts Bureau of Labour Statistics (11) possesses a value and interest not less than that attaching to individual chapters of such a work as Mr. Brassey's on *Foreign Wages and English Labour*; but it is the interest of a collection of materials rather than of a complete work. The local information as to the frequency and failure of strikes contained in the present volume, the eleventh of the series, is highly instructive, but after all may be summed up in a very few words. To 109 unsuccessful strikes there have been 18 successful ones. The amount of wages lost is far greater than the amount which the success of all the strikes could in many months have added to the earnings of the wilful sufferers; and the net result is even more unfavourable to the Unionists than in England—one important Union, that of the shoemakers, having, after a vast waste of money and great injury to a most extensive local trade, been reduced to insignificance, if not destroyed. The lesson might be taken home by Unionists here. It is worth remarking that emigrant English Trade-Unionists are charged with the chief responsibility for the mischief, and that in Massachusetts, as in the mother-country, professional agitators rather than practical workers appear to influence the action of the artisans, and to profit in proportion to the violence of their counsels and the losses of those who follow them.

Among the multitude of public documents before us, by far the most important is the enormous volume which contains the second part of the medical portion of the great collection of professional experience acquired by the surgeons of the Federal army during the Civil War (12), sifted, arranged, and now in course of publication at the expense of the Government. Its technical and practical value can hardly, we should think, be exaggerated.

The Report of the Secretary of the Treasury for the year 1879 (13) shows a total revenue of 274 millions of dollars, of which 251 were derived from customs and internal revenue (so-called), with an expenditure of 267 millions, of which 105 were interest on the public debt. Thirty-five millions were expended in pensions, 5½ millions on the payment of the Halifax award, 40 millions on the army, and 15 upon the navy. The sum applied to the reduction of debt was but trivial.

The Report of the Commissioner of Internal Revenue (14) shows that extreme difficulty is found in repressing illicit distillation, which leads to not a few murderous conflicts, in which the sympathy of the local juries appears to go with the offenders, so that it is difficult to obtain redress or punishment from the State courts where Federal tax-collectors have been injured or killed.

The most important part of the Report on the Internal Commerce of the Union (15) deals with the relations of the great railway companies to one another and to the public, a subject on which great and apparently well-founded dissatisfaction still prevails.

The Report on Imports and Import Duties (16) shows a terrific list of articles subject to enormous duties, a hindrance to trade which even the vast internal resources of the Union can with difficulty endure.

The State Papers of Massachusetts on Convict Labour (17), State Charities (18), and Prisons (19), possess greater value and interest than those of perhaps any other State in the Union.

THE MINISTRY.

THE selection of the Cabinet Ministers has corresponded in most instances with general expectation, and no serious objection can be raised to the distribution of offices. It would have been impossible to pass over Lord GRANVILLE's claim to the place which is generally regarded as second in Ministerial rank. Nearly thirty years have passed since he was first appointed Foreign Secretary by Lord JOHN RUSSELL, and in Mr. GLADSTONE's last Administration he was designated by general opinion as the fittest successor to Lord CLARENDON. During the last three or four years Lord GRANVILLE has carefully abstained from sharing in the violent hostility with which Mr. GLADSTONE and some other members of the party have assailed Lord BEACONSFIELD's policy. Though he will perhaps agree in the opinions of the PRIME MINISTER, he will not be inclined to reverse or disturb the relations which have been established among the European Powers. Even if Mr. GLADSTONE should, for the first time in his long official career, aspire to regulate the foreign policy of the country, his decisions will take their final shape from the channel through which they must be conveyed. If Lord HARTINGTON had been appointed to the Foreign Office, he would have had his business to learn. There is no reason to believe that he has at any time been a professed student of history or diplomacy, though his spirit and good sense would have enabled him to represent the country without discredit. It has fortunately not occurred to Mr. GLADSTONE to invite Lord DERBY to return to the Foreign Office. Few tendencies are so dangerous in the conduct of great affairs as habitual and insurmountable determination to avoid tangible risk and definite responsibility. If it is true that Lord DERBY has declined offers of joining the Government in some other capacity, he has probably had good reasons for his decision. The hopes which turbulent Russian politicians have founded on the result of the English elections will almost certainly be disappointed. Their complaints of the resolute pertinacity with which, as they assert, Lord BEACONSFIELD baffled and defeated the legitimate aspirations of Russia, may perhaps remind his successors of the unpopularity which would be incurred by a policy of ostentatious deference and concession. Mr. GLADSTONE's wild rhetoric will be largely modified by translation into Lord GRANVILLE's temperate and courteous conversation and despatches. In the House of Commons Sir CHARLES DILKE will represent the department with a vigour and knowledge of business which will render it unnecessary, as it might be unsafe, in ordinary cases for the Prime Minister to explain the policy of the Government.

Mr. GLADSTONE was well advised in giving the conduct of Indian affairs to Lord HARTINGTON, and in employing Lord NORTHBROOK in another office of which he has already had experience. The appointment of the Duke of ARGYLL might have been disastrous; and it is in almost all cases convenient that Ministers should not be pledged to any special policy in the business of their own departments. The traditional practice of entrusting the great offices of State to Parliamentary leaders, without reference to their knowledge of the special business of their respective departments, is justified by experience, though to theorists it appears paradoxical. There is no doubt that Mr. CHILDERS will soon master the details of the War Office, or that Sir W. HARCOURT will be an active and able Home Secretary, whether he defeats the unexpected opposition at Oxford, or represents some other constituency. Lord KIMBERLEY has once before been Colonial Secretary, when his policy was indistinguishable from that which was afterwards pursued by Lord CARNARVON. He approved of the annexation of the Transvaal; and he will promote the federation of the South African provinces, if the measure is ultimately found practicable. The selection of Mr. FORSTER for the office of Irish Secretary is creditable both to the PRIME MINISTER and to himself. The late competitor for the office of leader of the Liberal party might without dispute have asserted his claim to high Ministerial rank. In choosing or consenting to represent the Government in Ireland he has probably been actuated by laudable ambition. It is not perhaps in English mortals to command the confidence of Irishmen, but Mr. FORSTER will do his best to deserve it. Even in that remarkable country honesty, temper, and ability in the conduct of business have a certain value. The Irish members will perhaps not be insensible to the compliment which a principal leader of the Liberal party pays to their country in the acceptance of an office which has frequently not even been held by a Cabinet Minister. It is not surprising that Mr. FORSTER, Mr. BRIGHT, and Mr. GLADSTONE himself should in the first instance have been thought to represent sufficiently the advanced Liberal party. Mr. CHAMBERLAIN, who has succeeded in obtaining admission to the privileged circle, has displayed at Birmingham administrative ability combined with extreme political intolerance. It may be hoped that the colleagues who were not forward in promoting his accession to their number will restrain the democratic energies of the most active manager of elections. It seems to have been found expedient to avert the risk of an immediate party schism. The hesitation with which the demand was at first received is in some degree satisfactory. The appointment of Mr. FAWCETT to the considerable office of Postmaster-General will be universally approved.

As it was impossible to find room in the Cabinet for all the leading members of the party, the omission of the names of Mr. LOWE and Lord ABERDARE from the list had been generally anticipated. In declining office Mr. GOSCHEN has undoubtedly been actuated by a high sense of public principle. With the exception of Mr. GLADSTONE, none of the Ministers surpass him in ability or in knowledge. Unfortunately the party is bound by incautious pledges to support a measure which Mr. GOSCHEN rightly considers dangerous. Not following the example of Mr. LOWE, Mr. GOSCHEN retains his right of independent opposition to the degradation of the franchise, though he will not be able to defeat it. Another able and trusted member of former Liberal Governments seems to have been forgotten during the formation of the Cabinet. Lord CARDWELL has scarcely a superior in financial and political ability and knowledge. If he had remained in the House of Commons he would, as of course, have become leader of the party on the retirement of Mr. GLADSTONE; and it seems strange that he should not share its triumph. It is possible that a favourite pupil of Sir ROBERT PEEL may not entirely sympathize with the recent developments of Liberalism; but, even after the admission of Mr. CHAMBERLAIN, the moderate section retains a numerical preponderance. It is more remarkable that Lord RIPON should have accepted the Viceroyalty of India than that he should have been

selected for the post. His ability, his rank, and his long and varied practice in public affairs qualify him for the highest administrative office. He has a special qualification for the Viceroyalty in the knowledge of military administration which he acquired at the War Office as Under-Secretary and afterwards as Secretary of State. Lord LANSDOWNE has shown some self-denial in returning to an office of secondary rank; and he will establish a strong claim to a political office in some future Cabinet.

Of all the Ministerial arrangements, the most important is Mr. GLADSTONE'S reservation to himself of the Exchequer. As Prime Minister, he would in any case have exercised the same control over the finances which formerly belonged to Sir ROBERT PEEL. His determination to undertake the detailed administration probably indicates his intention of introducing some great financial enterprise. The scheme which he vaguely announced in his appeal to the constituencies in 1874 has never been further explained; but he may perhaps now have determined to prosecute the design which was then interrupted. He cannot, indeed, use the small surplus which he inherits from his predecessor to abolish the Income-tax; but the readjustment of taxation, or, in other words, the imposition of new taxes, may be effected with the aid of an irresistible majority. One of his proposals will no doubt be the imposition of additional burdens on landed property in the form of Probate duties, or of an increase of the Succession duties; and the small minority which consists of landowners will in vain contend against a popular and plausible demand. It is extremely doubtful whether the Income-tax ought at any time to be repealed; but since the date of his first Budget, seven-and-twenty years ago, Mr. GLADSTONE has repeatedly proposed to abolish the tax. Another conjecture points to the eventual reduction of the charge of the Debt by the creation of a 2½ per cent. Stock. Mr. GLADSTONE attempted to begin the change when the South Sea Stock was commuted in 1853; but the Crimean war immediately afterwards put an end for the time to financial experiments. It may be considered certain that Mr. GLADSTONE has not burdened himself with extraordinary labour and responsibility for the purpose of transacting the simple routine of business. There is too much reason to fear that he will stint the public service; but, on the other hand, it is not undesirable that he should have enough to do without interfering with foreign policy.

THE BUSINESS OF THE NEW PARLIAMENT.

THE object for which the present Parliament was elected is already accomplished in the overthrow of Lord BEACONSFIELD'S Government. The further measures to which the majority is pledged are few, and they attracted little attention during the contest. The Parliament of 1868 had a more definite task in the destruction of the Irish Church Establishment. That it would also effect a great constitutional change by the introduction of the Ballot, that it would try the bold experiment of remodelling Irish land tenure, and that it would create a new system of elementary education was not distinctly foreseen. The present Government will probably interfere to a greater extent between Irish landlords and tenants, though no definite plan, except Mr. BRIGHT'S, has been proposed by the leaders of the dominant party. They have on many occasions announced their intention of relaxing the control which landowners both in Great Britain and Ireland exercise over the future destination of their estates; but the total and immediate abolition of settlements on unborn children would provoke strong and almost unanimous resistance among the class which would be directly affected by the change. For the present it will perhaps be thought more prudent to accept Lord CAIRNS'S scheme of legislation than to propose more ambitious measures. Country gentlemen will have reason to regret the failure of the late Government to pass a Bill for the institution of a partially representative rural administration. The County Boards Bill of 1878 was abandoned because it was found that the farmers cared little or nothing for a measure which had been clamorously demanded in their name; but the Government ought to have foreseen that their omission to legislate would give their successors the opportunity of making far more sweeping changes. In one of his Midlothian speeches Mr. GLADSTONE, forgetting that he had himself promised to relieve the rates at the expense of the public taxes, found fault with the Ministry for not having reserved the boon to be eventually exchanged for a sacrifice of the privileges and power of the landed gentry. The present Government will probably establish rural corporations on the basis of the elective franchise which already exists in boroughs.

By far the most important measure which is likely to occupy the present Parliament will be an organic change in the representative system. The extension of household suffrage to counties, with the accompanying or ensuing redistribution of electoral power, will be the greatest constitutional change since the first Reform Bill. The large increase of the constituencies in 1867 has had questionable results, but it left almost untouched the wholesome anomalies which alone allow minorities and special interests a reasonable share of representation. A few small boroughs were disfranchised or deprived of one of their members; but there is still abundant ground for the arithmetical protests of democratic levellers, and for the complacency with which theorists of opposite opinions habitually regard inequalities resulting from historical accidents. One part of the legislation of 1867 was justifiable and advantageous. The qualification of a 12*l.* rating in counties admitted a large and responsible class of voters which had been excluded by the first Reform Bill, as amended by the CHANDOS Clause. The owners of land, who had for five-and-thirty years controlled the county representation, were deprived by the Ballot of a great part of their influence, which in some districts, especially in Wales, was transferred to Dissenting ministers, who in the methods and objects of their political agitation strongly resemble Irish priests. In other parts of England substantial farmers return the county members. On the whole, the farmers have been disposed to act with their landlords, and the minority would probably return to their allegiance if they had the opportunity of determining another election; but after the next dissolution they will find themselves outvoted by their labourers. The extension of the suffrage will be comparatively innocuous in suburban districts where the middle classes are numerous. In Lincolnshire and the Eastern Counties tenant-farmers may as well henceforth cease to trouble themselves with politics. In pledging his party to a dangerous measure, Lord HARTINGTON committed one of the two or three serious mistakes of his creditable and prosperous career; but his hasty decision will now have no serious consequences, because Mr. GLADSTONE with the democracy at his back would in any case have opened the door to the reinforcement which awaits them without.

Although another dissolution will probably take place within two or three years, the extreme Liberals, who will carry with them their unwilling allies, have good reason to calculate on a long and uninterrupted career of success. The only cause of a new election will have been the admission to the suffrage of an additional multitude of poor and ignorant voters, and the abolition of small constituencies which might possibly cultivate independent judgment. Cynical Conservatives will perhaps console themselves for their late defeat by gloating over the swift retribution about to fall on mutinous tenant-farmers and on disfranchised boroughs which have swelled the Liberal majority. Graver politicians are not reconciled to public evils by the merited punishment which may be inflicted on any section of the community. Another appeal to the electors will in some respects be acceptable to the party of movement. As there will then be no BEACONSFIELD Government to expel from office, more comprehensive projects of change will be proposed to the democratic constituency. There can be little doubt that the Nonconformists will insist on compensating themselves for their late significant silence by an attack on the Church. It is not likely that any Bill for disestablishment will be laid before the present Parliament, which indeed is otherwise provided with sufficient occupation; but no long time will elapse before some private member proposes a resolution for the purpose of eliciting the opinions of the Government. It may be conjectured from the effusive gratitude which Mr. GLADSTONE has repeatedly expressed to his Dissenting supporters that he will apply to the English Church the vague and menacing language which he has already addressed to the Scotch Establishment. Some of his colleagues will probably require that the destruction of the Church shall be an open question, until it advances, according to one of Mr. GLADSTONE'S favourite phrases, into the region of practical politics. After a time it is not

unlikely that the controversy may result in a coalition of the moderate Liberals with the Conservative party.

The apprehensions of a violent reaction in foreign policy, though they are naturally suggested by Mr. GLADSTONE's speeches, may perhaps be falsified by experience. The immediate direction of the national policy will be entrusted to other hands; and, having enough to do in finance and in domestic legislation, Mr. GLADSTONE may probably after a time relax his interest in subjects foreign to his studies and habits of thought. His colleagues may be able to divert him from hasty schemes of philanthropic agitation, and the FOREIGN SECRETARY will address even the Austrian Government in courteous terms. Lord BEACONSFIELD was perhaps induced to concentrate his energies on diplomacy by his well-known indifference to the details of domestic legislation and government. In dealing with Great Powers on matters of vital importance he found himself seriously interested in questions more important than party tactics or Parliamentary management. Similar reasons, operating in the contrary direction, will induce Mr. GLADSTONE to prefer the department in which he is an acknowledged master. It is only when foreign complications allow an admixture of sentiment and passion that they attract Mr. GLADSTONE's attention. Lord BEACONSFIELD has throughout his career regarded domestic policy principally in its relations to party; but as Minister he always took care to supply his own deficiencies by the selection of colleagues who understood current business better than himself. It is to be hoped that both in Indian and European affairs Mr. GLADSTONE will at least not be in a hurry to reverse the policy of his predecessor. The invectives which were calculated to suit the taste of excited crowds have served their turn, and they ought not to be mistaken for arguments and statements of fact such as those which ought to affect the decision of a Government. The modern practice of appealing to the people on questions which are only understood by studious politicians produces almost unmixed evil. The speaker has probably convinced himself as well as his audience; but when he is called upon to act, instead of declaiming, he ought to reconsider the subject. Three or four years ago Mr. GLADSTONE incidentally remarked in the House of Commons that he had always found the Cabinet disinclined to attend to Indian business. His opinion of the due prominence of foreign affairs has been more frequently quoted. The best service which he can render to the country in both departments of Government is to abstain as much as possible from interference which is likely to be mischievous.

FRENCH ELECTORS AND FRENCH POLITICS.

THERE is an obvious resemblance and an important difference between the position of the Liberal party in France and that of the Liberal party in England at the present moment. In both countries the Liberals seem secure beyond the possibility of reverse. M. GAMBETTA and Mr. GLADSTONE alike command the support of an organization which at the last election carried everything before it. But in England this victory represents for the time the whole effective force of popular feeling. When the Conservatives once more find themselves in office, it will be by reason of a change of mood in the electors who voted last month. Some who then supported Liberal candidates will have turned round and supported Conservative candidates; some who then supported Liberal candidates will have conceived some grudge against their party, and will not have voted at all. In France, on the other hand, there is always an unseen and unheard force to be allowed for. Beneath and by the side of the electors who care about politics, and who vote, or abstain, or change their sides on what—using the word in a very wide sense—may be called political grounds, there are the electors who do not care about politics, and who consequently in ordinary times do not trouble themselves to go to the poll. The storms which fret the surface of French affairs do not penetrate into these deep seas. The peasant scarcely knows the name of M. DE FREYCINET or M. FERRY, or, if he does, it is simply as words which fill a certain space in the newspapers, or on the doors of some official building. He is neither a Conservative nor a Radical, if by Conservative and Radical are meant the Parliamentary parties that pass by those names. Provided that he is left alone, and not frightened, he is willing to let the elections go as those who take an interest in them like to decide. He does not expect to be affected by the result of them, and so long as he is easy on this score he does not care what that result is.

When therefore we read that the Republican deputies have returned from visiting their constituents during the recess with the fullest assurance that the course taken by the Government as regards the religious orders meets with universal approval, except among avowed Clericals, we have no difficulty in accepting this statement as true. For one thing an avowed Clerical in the mouth of a French Radical means just at present a man who opposed the Seventh Clause of M. FERRY's Bill and who dislikes the administrative decrees which have been called forth by the rejection of that clause. But even without this explanatory qualification the news is less satisfactory for the Cabinet than it appears to be. If Frenchmen would consent to be illogical it is possible, and even probable, that the attack upon the unauthorized religious orders would do the Government no harm. The peasantry know little about these orders, and have no particular love for them. They might even welcome the expulsion of the Jesuits as an easy way of disposing of a dog who has somehow got a very bad name. The sorrows of the upper classes, who would have either to send their sons abroad to be educated or to put up with less fashionable schools than those to which they are accustomed, do not move them in the least. Nor is their love of liberty of that consistent and sensitive sort which is pained by an act of administrative tyranny, even when the victim is a monk. There is no reason, however, to suppose that Frenchmen, least of all French Radicals, are for about the first time in history going to become illogical. The majority in the Chamber of Deputies has forced M. DE FREYCINET to take up an anti-Clerical position. It may be quite true, as the Paris Correspondent of the *Times* so often assures us, that left to himself he would never have wished to attack the religious orders. But this only shows more conclusively how strong must have been the pressure to which M. DE FREYCINET was subjected. What guarantee is there either that similar pressure will not be again exerted, or that he will not again yield to it? It is said—and it certainly sounds exceedingly probable—that M. DE FREYCINET has yielded a little in order to save himself from being obliged to yield a great deal. If he had refused to issue the decrees, he would have been left in a minority in the Chamber, and then he must have made way for some other Minister who would have applied them with infinitely greater stringency. If this reasoning is good for putting out the decrees, it will be equally good for acting upon them. The whole question becomes one of degree, and M. DE FREYCINET can always persuade himself and the Correspondent of the *Times* that the cause of moderation will be benefited by his remaining in office. Even if it came to executing Jesuits instead of banishing them, there would be milder and harsher ways of setting about it, and M. DE FREYCINET might argue that, as a true friend to the religious orders, he was bound to continue Minister in order to ensure their members being guillotined and not broken on the wheel.

The mere fact, therefore, that M. DE FREYCINET is as full as he can hold of the best possible intentions does not seem to have much to do with the question. It is more important to know what the Radicals will wish him to do than what he wishes to do himself. He may not go quite the lengths he is asked to go, but he will think it better for the Church that he should go three parts of the way rather than leave it to somebody else to go all the way. The only chance, therefore, that the anti-Clerical movement will end with the decrees against the religious orders lies in the possible contentment of the Radicals with the victory they have already won, and this appears to be a very small chance indeed. They have been careful, while accepting what the Government have done as an instalment, to show their contempt for it even when considered as an instalment. M. CLÉMENCEAU loses no opportunity of pointing out what miserable half-measures the 7th Clause and the decrees are, how inadequate they appear to every politician who has any regard for principle, and how steadily the Government must be driven forward in the path which it has entered so late and along which it moves so lamely. There is every likelihood, therefore, that the first step in anti-clerical legislation will not be the last; and though every fresh step may stop a little short of what M. DE FREYCINET is urged to make it, it will be at least as much in advance

of what he would make it if he followed his own judgment.

It is when this point has been reached that the importance of the usually inert element in the electorate will be seen. Unfortunately for Cabinets, this element will move when it does move with little or no warning, and on what may appear very slight provocation. It is impossible to say beforehand what will be the feature in the coming Radical legislation that will alarm the peasantry; it is almost certain that there will be some feature or other in it that will alarm them. When alarmed, they will show their strength as they have shown it before. If they were accustomed to take part in the elections, they would understand that all that is required to manifest their distaste for the policy of the Cabinet for the time being is to return representatives, pledged according to the necessity of the situation, either to modify the policy or to overturn the Cabinet. But to men who are not accustomed to take part in elections the application of Parliamentary machinery is apt to seem insufficient for the purpose they wish to attain. What they really dislike may be the mode in which the institutions under which they live are administered; but what they think they dislike is ordinarily the institutions themselves. It is plain that France has already wandered very far away from that moderate and Conservative Republic which M. THIERS declared to be the only Republic that could last. She may yet come back to the path she has left; but, if she does not, it is pretty safe to predict that the element in the constituencies which the Radical party persistently ignore will be strong enough to upset what it may not be patient enough to guide.

THE CONSERVATIVE COLLAPSE.

THE article which appears under the above title in the *Fortnightly Review* of to-day is one which is calculated to excite a good deal of attention and curiosity. It is unsigned, or rather signed with a *nom de plume*, contrary to the usual habit of the periodical in which it appears, and its internal evidence of authorship is curiously conflicting. There can hardly be two persons in the country who seriously think the action of the GLADSTONE Government in 1870 to have been so "strong" as "INDEX," the writer in the *Fortnightly Review*, thinks it. But, on the other hand, this is the kind of stroke which a skilful writer anxious to divert suspicion from himself would naturally insert. On the other hand, the one person who is known to regard the action of England on that occasion as on a par with the noblest exploits of the heroes of antiquity seldom writes so clearly and simply as the *Fortnightly* Reviewer. Perhaps it is but an idle task to attempt to reconcile the voice of JACOB and the hands of ESAU, especially as a literary *supercherie* would be by no means difficult in such a case. It is sufficient that the article is known to come from a source of more or less importance, and that its contents are such as to deserve attention, even if their author were the first comer. It may not be, as it has been confidently pronounced to be, the work of the PRIME MINISTER; but it puts for the first time very clearly and definitely a view as to the shortcomings of the late official representatives of Conservatism, and of the probable future of the party, which has been more than once visible, bobbing up and down amid the turbid torrent of Mr. GLADSTONE's political harangues.

This view can be put with sufficient brevity. Conservatism and the conduct of Sir ROBERT PEEL are, according to the writer, convertible terms. He points to the Peelite creed—or, as that symbol would be rather difficult to draw up, perhaps we had better say the Peelite practice—and tells Conservatives that under this standard, and under no other, they may conquer, or at least wage a not unequal fight. Sir ROBERT, according to this fervent ultra-Liberal panegyrist of his, had six points—purity, legislative activity, economy, financial regularity, an indisposition to bring on questions of party principle, and a habit of sticking to the form of his measures. We may note in passing, as a side-light to the question of authorship, the entire omission of all reference to foreign policy. Now these six things distinguished Sir ROBERT PEEL and all his works, and the absence of them has as characteristically distinguished Lord BEACONSFIELD and all his works. Hence the paths of honour and of shame that each (it need not be said that we speak in the sense of our author) has trod respectively. It is not necessary to go through the various demonstrations which are resorted to for the purpose of proving the case. The denunciation of "Conservative Government" by Mr. DISRAELI as "organized hypocrisy," and the still more famous remark about "education," of course play a very large part in the argument, and a minute criticism of various acts of the late Government a still larger. Most of this is not new, and has been argued and re-argued a thousand times before. The real points of interest in the article may be said to be three. The first is that the author is either actually convinced, or has laboured so hard to convince himself that he has almost succeeded, of what may be called the "diabolical" theory of the late Government and its acts. A considerable portion of his article might be taken to be an argumentative extension of the worst-government-the-country-ever-had axiom. He labours to prove that the policy of this unfortunate Ministry imitated "all "that was least good in the Liberal tradition and all that "was most blameworthy in the Conservative," and the mixture of respect, aversion, and alarm with which he speaks of Lord BEACONSFIELD is exceedingly odd. It is exactly the language of old days in reference to the Prince of Darkness. In the second place, this ultra-Liberal generously admits the presence of a large Conservative element in the country, and endeavours by this admission to console the "Old Conservative" to whom the article is addressed, and who seems to be an estimable but rather feeble personage, eminently of the kind that the authors of political and philosophical dialogues and discussions are apt to set up to be bowled at. Lastly—and this is the real purpose of the article—he urges upon his enemies the necessity, if they wish for their soul's and their party's health, of recurring to that model of Conservatism which reigned paramount between 1830 and 1850, and the observance of which in 1844 placed the Conservative party "in the zenith of its prosperity."

This view seems to be equally worthy of attention from Liberals, from Conservatives, and from "moderate men"—a term which, after some two hundred years' disuse, seems to be coming to the front again. The ideal proposed may be taken without discussion as being that which Liberals of the author's type would like to see realized. Perhaps it may be said that this is of itself sufficient to render it suspicious to minds of other political complexions. But this would be to take too offhand a view of the matter. *Fas et ab hoste* is a sufficiently venerable motto to deserve the attention of the most bigoted Tory, much more of impartial politicians. In order, however, to judge "INDEX's" proposal, we have only two very simple things to do; to look at the programme he offers in itself, and to look at the historical experience of its adoption. There can be no doubt that from each point of view its acceptability to a Radical is obvious. As far as we can understand "INDEX," his idea of an enemy's army seems to be very much that of FREDERICK WILLIAM of Prussia as to his own—that is to say, that it is never to fight. Of the six points of his programme, one announces in plain terms that "Conservatism "is not to be brought face to face with Liberalism in an "open field." Four of the other five might be generally described as the adoption of the most elaborate precautions to prevent the two parties from coming to blows even on a side issue. It can easily be understood that such a policy as this would be agreeable to the opposite party. It would, in fact, secure that Conservative Governments, when they did hold office, should hold it on the condition of not being Conservative, and that their time of so-called power should be merely an agreeable rest for their adversaries, during which they might take their ease and purge themselves of the natural and inevitable unpopularity which office brings. It may also be said that such a policy would organize defeat for those who pursued it whenever anything like a real battle came. Accustomed to a colourless policy, and to being indistinguishable from their opponents, they would certainly lose that *esprit de corps* which is as necessary to a party as to an army. They would come to regard themselves as only Liberal warming-pans, lieutenants, in the strict sense of the word, of their nominal adversaries. Nor does an historical retrospect dissipate this conclusion. It is quite possible that a cautious leader, like PEEL, was better suited than a more daring one to re-form a beaten party after the huge collapse of 1832. But it is equally certain that his policy restored little more than a fictitious life to that party. Unremitting "nursing," careful abstention from doing anything com-

promising, and the faults and incapacities of his opponents, resulted after a decade in a Conservative majority of about the same numerical strength as the Liberal majority of to-day. But what was the value of that majority? In 1844, according to "INDEX," the Conservative party was in the zenith of its prosperity. In a few months the whole party broke to pieces, and never regained real power—as distinguished from power temporary and by sufferance—for nearly thirty years.* The merits of the question which shattered it have nothing to do with the case. That question was at least no new one; and, had the leader and his policy of leading been what they should have been, party discipline and party education would have held the followers to their chief or the chief to the followers. But, accustomed as they had been, according to "INDEX," to see questions which might provoke party opposition avoided, there was no discipline, and there had been no need for education. The party had come to include men as different from one another as the men who compose the Liberal party now are; and the inevitable strain brought about the inevitable split. No doubt, from "INDEX'S" point of view, the consummation was not undesirable. There must, as he very truly says, always be a Conservative feeling in the country. If there were no recognized Conservative party, that feeling might either lead, as in some Republican countries, to the non-participation of important elements of society in political matters, or, as in others, to the formation of a dangerous and fanatical set of reactionists. "INDEX" would therefore like there to be a Conservative party to absorb these and other elements congenial to it, and to keep them in a state of solution, offering no real impediment to his own side, but serving as a kind of ballast to the ship of State, and occasionally, in an interval of simulated and permissive power, administering a gentle alterative to the body politic. An incongruous conjunction of metaphors is requisite to indicate the incongruity of the proposal. Perhaps the old Conservative friend may be seduced by it, but the majority of the party are hardly likely to consider it satisfactory, nor, we may add, are politicians who look at all sides of a question. A great political party which lives in a vain show is not likely to be a national benefit. It is very likely to be termed, and to be termed with truth, an "organized hypocrisy."

AFFAIRS IN AFGHANISTAN.

THE victories obtained by Sir DONALD STEWART, Colonel JENKINS, and General ROSS, and the unopposed occupation of Ghuznee, are gratifying, but the satisfaction which they suggest is tempered by the proofs which have lately been afforded of the pertinacity of the hostile Afghans. The attack on the force which had advanced from Cabul was probably a part of a concerted scheme; and, according to one account, the English troops had found it expedient to retire within the fortifications of Sherpur. One of the most troublesome peculiarities of half-civilized adversaries is their apparent inconsistency in submission and resistance. During the first and second advances on Cabul the invading force encountered no formidable opposition, although the Afghan power was then unbroken either by military disaster or by political dissension. It was not until Cabul was occupied, after the skirmish at Charasiab, that the English position was attacked by a large army, of which the very existence had been previously unknown. It is not known whether General STEWART had, before the commencement of his advance from Candahar, anticipated the hostility of the strong force which, having executed a parallel march, attempted to bar his road to Ghuznee. It is sometimes difficult to distinguish between friends and enemies. The Governor of Ghuznee seems to have surrendered the place voluntarily when the garrison had left it to join the army in the field. It may be hoped that the heavy losses sustained in the late engagements will convince the hostile leaders of the inutility of further resistance. The tribe called the Hazarehs creates an incidental embarrassment by prosecuting an ancient feud with the Afghan malcontents at a time when the English General wishes to conciliate the hostile chiefs. There is probably sufficient foundation for the opinion which seems to prevail in India that the result of recent operations is on the whole satisfactory, though it was said a few days ago that the enemy was collecting in large numbers round Charasiab. The occupation of Ghuznee deprives MAHOMED JAN of his only stronghold; and it greatly facilitates the communication between Candahar and Cabul. Some of the chiefs who had previously held out have lately tendered their submission, and special importance is attached to the arrival at Cabul of delegates from Kohistan, though they are said unanimously to favour the pretensions of ABDURRAHMAN, whose position and political tendencies are still imperfectly known.

There is reason to believe that ABDURRAHMAN has to some extent established his influence among the tribes of Turkestan; but he may perhaps not be equally successful in obtaining the support of the Southern chiefs, even if the Indian Government should be disposed to recognize his title. Candahar will, in any case, unless Lord LYTTON'S policy is suddenly reversed, be the capital of a separate province, as long as SHERE ALI maintains his fidelity to the Government which appointed him. It is uncertain whether ABDURRAHMAN entertains any immediate design on Herat, which is still in the possession of his kinsman AYUB. If the effect of the Afghan war is to split up the country once more into several principalities, the result may perhaps not be exclusively owing to English interference. It is extremely doubtful whether YAKOOB KHAN would have been able to keep together the dominions of his father, even if he had succeeded in time of peace. The strong and friendly Afghanistan which Indian statesmen have reasonably desired to maintain has had but a precarious existence. It was only strong under a vigorous ruler, who was sometimes friendly to his powerful neighbour, and often jealous and dissatisfied. Until another DOST MAHOMMED arises, the Afghan monarchy will probably not be reconstituted. As an alternative, it may become necessary to deal with several petty potentates who may perhaps be as manageable as one powerful and ambitious ruler. If the late contests and negotiations have had no other result, they must at least have extended the knowledge which Indian officers, civil and military, possessed of Afghan affairs. All the chiefs of importance have had relations with the generals or with other agents of the Government, and personal acquaintance must have thrown much light on their several dispositions, and even on the national character. General confidence is reposed in the experienced judgment of Mr. LEPEL GRIFFIN, who is now charged with the diplomatic or political conduct of affairs. Sir DONALD STEWART, who will in right of seniority assume the chief command at Cabul, has displayed remarkable ability during his long exercise of authority at Candahar. The new Viceroy will have ample means of forming a sound opinion on the complicated questions with which he must necessarily deal. It may be hoped that he will not arrive in India unduly fettered with instructions from home, which must necessarily be founded on imperfect knowledge.

Among other prejudices it will be proper to guard against the delusion that recent transactions have produced an irreconcilable quarrel between the Afghans and their conquerors. Domestic blood feuds are universal among uncivilized tribes, but the custom or feeling scarcely applies to national wars. The Afghans must be unlike other warlike races if they have not conceived a respect for a power which has on many occasions proved itself irresistible. Except in the surprise which caused in December last the temporary evacuation of Cabul, they have not, during a year and a half of fighting, repeatedly renewed, obtained the advantage in a single skirmish. The traditional belief in the inability of an English army to maintain itself through the winter at Cabul has been dissipated by the most convincing evidence to the contrary; and Sir DONALD STEWART has proved that the most desperate valour is insufficient when it is opposed to superior arms and regular discipline. It is true that the Afghans have shown themselves respectable, and even formidable, enemies; but they will probably at last admit that they are overmatched. As long as the struggle continues, their natural dislike of strangers and invaders will be reinforced by religious antipathy; but they will not be the only Mahometans who, after opposing the establishment of English dominion, have learned to maintain peaceable relations with the victorious infidel. There are many Afghans in the ranks of the Indian army who are not less trustworthy than their Mahometan or Hindoo comrades. Hereafter it will perhaps be found practicable to make use on a larger scale of the military aptitude of some of the Afghan tribes.

There is no reason to suspect that Lord HARTINGTON

will wantonly sacrifice the results of a costly enterprise. In common with the other leaders of the party, he has from time to time denounced the policy of the late Government and of Lord LYTTON; but he has probably not studied the question in detail, and his good sense will secure him against the temptation of holding himself bound by his own language used in the heat of controversy. He was perhaps too careless in his declaration that his party would, on its accession to power, take measures to retire from Afghanistan as soon as the movement could be safely and creditably effected. He afterwards took an opportunity of laying additional stress on the limitations which he had already recognized. No Government wishes to attempt the permanent occupation of Afghanistan, and the only difference of opinion is as to the conditions of an eventual retreat. The dispute as to the frontier is settled by the course of events, although differences of opinion on the subject still exist. There is no longer any question as to the retention of control over the Khyber and Bolan passes; and it is not likely that any Government will propose to abandon Quetta. The eventual fate of Candahar is more uncertain, because a force quartered there under the control of a Resident would be far in advance of the Indian frontier. If the railway to Candahar had been completed, the transit must necessarily have been guarded by English troops, which would be most conveniently quartered at Candahar. The new Government may perhaps suspend the work, notwithstanding its political and commercial importance; but Lord RIPON will probably study the question before a decision is made; and it is believed that Indian opinion favours the dependence of Candahar on English protection. If Quetta is the furthest outpost in the direction of Afghanistan, it may be doubtful whether Lord LYTTON's nominee at Candahar will be able to maintain his position. On this and other subjects it would be inexpedient to decide in a hurry; and no judicious statesman will allow his policy to be regulated by the opinions which he or his colleagues may have expressed in an earlier and different state of circumstances. Lord HARTINGTON has probably by this time ceased to take even the smallest interest in the question which maintained the wrath of the Duke of ARGYLL through a dozen speeches and two ponderous volumes. Whether SHERE ALI was alienated from England by the coldness of Lord NORTHBROOK or by the urgency of Lord LYTTON is an inquiry now wholly obsolete. One of the soundest principles of English administration would be violated if the present Ministers were eager to reverse the policy of their predecessors.

THE HOME RULERS.

TO the commonplace English mind it seems only natural that Irish Home Rulers should hold their meetings in Ireland. Mr. PARNELL, always original, is original even on this point. He applies to politics the doctrine that his countryman applied to more material things, and holds Ireland to be the best country in the world to live out of. Mr. SHAW may perhaps be excused for his inability to follow his colleague's eccentric reasoning. As the Home Rule members were to meet somewhere before the opening of the Session, he thought that they should meet in Dublin. Probably if Mr. SHAW had thought that they ought to meet in London, Mr. PARNELL would have been in favour of Dublin. Union is so essential to the success of the Home Rule agitation that Mr. PARNELL is naturally anxious to promote it in every possible way, and his notion of promoting it is not to allow of the faintest difference among Home Rulers. If they do not say ditto to Mr. PARNELL they must go into the outer darkness. Mr. SHAW is naturally the person who is most suspected of meditating the intolerable presumption of having an opinion of his own. Though he has not succeeded to Mr. BUTT's position in the party, he has, more than any other Home Rule member, succeeded to Mr. BUTT's views. He has not yet ventured to express them with Mr. BUTT's plainness of speech, but that is accounted for by the fact that his relations with Mr. PARNELL are of a different character. Mr. BUTT was the leader of the Home Rule party, and in condemning Mr. PARNELL's action he addressed a schismatic. Mr. SHAW is not the leader of the Home Rule party, but merely occupies a not very well defined position as its Parliamentary chief; and in addressing Mr. PARNELL he can only remonstrate with a superior officer who, as he thinks, is injuring the cause by his imprudence. Mr. PARNELL knows how to treat remonstrances of this kind. He is emphatically of the order of men who stand no nonsense. With him discipline is discipline, and a commander-in-chief ought to have no more scruple in shooting a field-marshal if he happens to be placed under his orders than he would have in shooting a private soldier. Consequently, Mr. PARNELL has resented Mr. SHAW's conduct in calling a meeting in Dublin as such presumption deserves to be resented, and Mr. SHAW saw the result of his anger in the empty benches which he had to address on Tuesday. Only twenty-two Irish members attended the Conference, and even of these not quite all were genuine Home Rulers. The absentees are either sworn followers of Mr. PARNELL, or thought that nothing would be gained by making their divergence from him evident any sooner than necessary.

These prudent spirits will not be able thus to economize much longer. As soon as the House of Commons is completely constituted they will have to choose whom they will serve. The first act of the great united Irish party will be to file off on opposite sides of the Speaker's chair. Mr. SHAW is a Liberal as well as a Home Ruler, and therefore will sit among the Liberals. Mr. PARNELL is a Home Ruler pure and simple, and therefore he will sit among the Opposition for the time being, no matter by what party name that Opposition may happen to be called. The distinction is perfectly rational at bottom, but a little amusing on the surface. Mr. PARNELL's hand is avowedly against every man. His Parliamentary function is to say No to every motion that is not moved by himself or his friends. In his view, this is the only function that the Home Rulers can discharge with proper respect to themselves. They have not come to Westminster to help English members to do English business. They are there to convince English members that the only way of doing English business is to shunt Irish members into a siding of their own, and leave them to do Irish business there. Consequently Mr. PARNELL is perfectly consistent in sitting on the Opposition benches. Obstruction must always be a form of opposition; and as yet Mr. PARNELL has not gone back from his pledge that this shall be the form which his opposition shall mainly take. Mr. SHAW's theory of working for Home Rule is altogether divergent from this. He, too, hopes to see Home Rule obtained by the action of a united Irish party; but he regards Home Rule as merely the first among many Irish measures which he desires to see passed, and, in the interval before Home Rule is obtained, he is quite willing to accept these other measures at the hands of any party which is prepared to concede them. As between the Liberals and the Conservatives, Mr. SHAW has no doubt which this Irish party ought to support. There are many things which the Liberals are ready to do for Ireland, there are very few things which the Conservatives are ready to do for Ireland. The Liberals sympathise with the Irish party on the Irish franchise, and Mr. GLADSTONE, at all events, is prepared to go a long way with them on the Irish land question. It is on the Liberal benches, therefore, that Mr. SHAW thinks the united Irish party ought to sit, whether the Liberals are in power or in opposition.

When a great united party is of opinion that its members ought all to sit in the same place, but cannot agree what that place shall be, it has no choice but to cease to be united even at the cost of ceasing to be great. There are cases in which means are of more importance than ends, and the difference between Mr. PARNELL and Mr. SHAW is one of these cases. So far as appears they are quite agreed as to the political change which they want to bring about. Both desire to see an Irish Parliament discussing Irish measures in the Irish capital. Both therefore aim at an object which, in the opinion of a vast majority of Englishmen, neither will be nor ought to be attained. But this fact does not of itself bring them into any hostile contact with Englishmen. The Home Rulers have just the same right to desire to modify the constitution of the three kingdoms in the way indicated, that is possessed by any other group of members which wishes to alter an existing legislative arrangement. In this sense Mr. BUTT was as decided a Home Ruler as Mr. PARNELL; but Mr. BUTT lived on very good terms with his brother members. The distinction between him and Mr. PARNELL was just what the distinction between Mr. PARNELL and Mr. SHAW is. It is a distinction of means. In the same way the distinction between a creditor who sues you for a debt and a creditor who

knocks you down and picks your pocket of the amount is a distinction of means. The end is the same in both instances—to get what the creditor thinks his due. But the means chosen by the latter creditor bring him within the grasp of the criminal law, and the means chosen by Mr. PARNELL must in the end bring him within the grasp of the Serjeant-at-Arms. It is a decided advantage from this point of view that the two sections of the united Irish party should sit on opposite sides of the House. Any obstruction that is offered will now come entirely from Mr. PARNELL's followers, and there will be no fear of the contagion spreading to Mr. SHAW's followers. The actual Obstructives have always been few in number, but they have gained in apparent strength by being mixed up, and consequently identified with, the Home Rule party generally. The temptation to go into the same lobby with a man who is sitting next you is greater than the temptation to go into the same lobby with a man who is sitting opposite to you. In the former case there is the force of habit to be resisted. You are accustomed to vote with your party, and the outward and visible sign of party is neighbourhood on the benches of the House of Commons. For the present, therefore, Mr. PARNELL's party may be expected to consist strictly of the members who sympathize with Mr. PARNELL's choice of means. Mr. SHAW will lead the Home Rulers, Mr. PARNELL will lead the Obstructives. Mr. SHAW will use argument to gain what he wants, Mr. PARNELL will use force. Mr. SHAW will be recognized as a politician with whom those who agree with him on other questions, while they differ from him on the Home Rule question, can cordially work; Mr. PARNELL will be recognized as a politician with whom no other Parliamentary section can work. More accurately, Mr. SHAW will be recognized as a politician, while Mr. PARNELL will continue to play the part of a Parliamentary outlaw, tolerated just so long as he is willing to make toleration a less troublesome process than punishment.

MEXICO.

THE visit of General GRANT to Mexico was as great a success as Americans or Mexicans could have wished. He was treated as the living embodiment of the United States, and all the honours that could be paid by a little State to a big one were paid to him. Even at Vera Cruz, which is ordinarily the most dismal and forlorn of places, he was welcomed with a profusion of flowers and with a salute of cannon, the only tributes Vera Cruz had at its command to offer to a hero and a general. He made a triumphal progress along the beautiful and interesting line from Vera Cruz to Mexico, breaking his journey at Orizaba, where he had more fêtes, more flowers, and possibly a salute from the pistols with which the inhabitants are obliged to go armed. In the capital itself he was lodged in the office of the Mint, one of the few handsome buildings that have escaped the effacing fingers of poverty-stricken Republicanism. Dinners, balls, reviews, and processions were given or instituted in his honour, and everything was done to cement the union between the two Republics. The Mexicans were worshipping the setting as well as the rising sun; as they saw in General GRANT not only the President that has been, but the President that is to be. In a moment of hilarious enthusiasm the importance of an accidental political event is apt to be overrated; but there can be no doubt that lately the Americans have been turning their thoughts to Mexico, and the Mexicans have been turning their thoughts to the United States. The two Republics have gradually been getting on good terms with each other. President HAYES, in his last Message, drew the attention of Congress to the great field for commercial enterprise which Mexico presented to adventurous Americans, and several important enterprises in Mexico are now in the hands of American capitalists. A great and most welcome concession to Mexican pride has also recently been made by the Government of the United States. Three years ago an order was issued to the General in command of the American troops on the Mexican frontier, that when raiders from the other side of the river got back from American soil before they could be caught, he should follow them and punish them on his own account, although they were treading their native heath. This obnoxious order has now been rescinded, and the Americans have even gone further, and have actually paid the Mexicans the compliment of inviting their troops to cross the border and help in subduing American Indians. On the other hand, the Mexicans have in one way wisely commended themselves to their powerful neighbours. Mexico owes America a debt of 800,000*l.* to be paid off by annual instalments of 60,000*l.* This is the only debt that Mexico recognises, and the only debt it pays. It is felt that it may be all very well to leave European creditors out in the cold, but that this will never do where Americans are concerned. Much of the present goodwill between Mexico and the United States is due to the tact and vigilance of Mr. FOSTER, who was for some time American Minister in Mexico, but who has now been transferred to Russia. He is to be replaced by Mr. MORGAN of Louisiana, from whom the Mexicans expect great things, as he is said to be an intimate friend of President HAYES, an accomplished Spanish scholar, and a jurist of attainments so wide and eminent that he has achieved the curious distinction of having been appointed an honorary member of the Egyptian International Tribunal. With Mr. MORGAN at their doors, and General GRANT at the White House, the Mexicans look for the coming of a good time, and for the establishment of very favourable relations between themselves and their neighbours whom they once thought so dangerous.

General GRANT was accompanied to Mexico by Señor ZAMACONA, who has been for some time residing in the States as the representative of Mexico; and in the flush of excitement which General GRANT's visit awakened, it occurred to some of the friends of Señor ZAMACONA that a man fresh from the States, with a strong leaning to Americans, and a personal friend of General GRANT, would make the best of all Presidents for Mexico. Whether his candidature is to be considered serious cannot as yet be pronounced, and many a candidate who rises into temporary prominence in the capital remains unknown in the provinces. The two accepted candidates for the Presidency have, so far as is as yet known, the field before them. General GARCIA DE CADENA makes no sign, and continues entrenched in the mysterious obscurity of his own distant State; but it is thought that his calm means mischief, and that he is only waiting to see whether and when it will answer to set the ball of revolution rolling. General GONZALEZ is in command of the troops that have been sent to put down scattered bands of insurgents on the West coast, and he has the immense advantage over all competitors that he has got an army at his disposal, and this army must desert him or be beaten before his claims can be ignored. Meanwhile President DIAZ not only declines to take any part in the coming Presidential contest, but has asked to retire, in consequence of domestic affliction, from the active exercise of his functions for a period of two months. His Government had, however, time before his retirement to decide two questions of great importance. In the first place, it gave the concession for the Central Railway, which is the key to the future of Mexican prosperity, to a group of American capitalists. It does not, however, appear to have done more than to have invited Congress to discuss, and, if it pleases, to sanction the concession, and has not pressed the concession on its acceptance. It is certain that a few months ago a concession of the main artery of Mexican communication to Americans would have had no chance of being adopted by a Congress the majority of which has repeatedly expressed its dislike of what it considers to be American intrusion. Possibly time, and General GRANT, and a change in public opinion, may have worked an alteration in the views of the deputies, and what would have seemed very dangerous in the last Session may be considered highly expedient in the present Session. In the next place, the Government, after much vacillation and after long coquetting with an idea which is only too fascinating to a Government short of funds, has finally, as, it is understood, rejected the proposal for establishing a National Bank. The proposed bank was to have an issue of notes to the extent of three times its capital, and to place almost all, if not all, its capital at the disposal of the Government. This must have led inevitably to a forced currency, and a forced currency would have sooner or later sunk Mexico to the level of Peru. There are not very many good things to be said of the past history of Mexico; but at any rate there is one good thing to be said, and that is, that the Mexicans have steadily set themselves to maintain the solid and honest basis of a metallic

currency. The projects which linked the fortunes of the English bondholders with a bank or a railway have necessarily fallen into abeyance now that there is to be no bank, and that the railway, if given to any one, is to be given to others. But the best thing that the bondholders can do is to wait patiently until the resources of the country are so developed that a portion of the real surplus revenue can be devoted to meeting their claims. How near Mexico is to having anything like a surplus revenue cannot be stated with any degree of confidence. Mexican Budgets must be placed at some unascertained point in the long interval which separates the budgets of England from the budgets of Turkey; but it is something to get what is called in Mexico a definitive budget, and the definitive budget of 1878 has now been published. From this it appears that the national income has risen from three and a half millions sterling to a little over six millions; but the expenses have also increased; and, although the two sides of the budget nearly balance, there was an excess of expenditure to the modest amount of 20,000*l*. That Mexican financiers should have been so adroit and so prudent as to have ended the financial year with this very small deficiency is a fact much to their honour, if only it is to be accepted as indisputable.

The general opinion seems to be that there will be some disturbance at the time of the Presidential election, but that it will be temporary and slight. With one candidate concentrating himself in a malignant calm, with another at the head of an army, and with a third offering himself as the friend of the speculative foreigner, the Mexicans do not see how they are to get through the election without something like a brush. In support of their calculations they can appeal to the history of all elections, and not only to the signs that indicate the course of this particular election. Meanwhile the attention of Mexicans is occupied not so much with the possibility of a revolution as with the fact of brigandage. Not improbably the indignation which brigandage now excites is itself a symptom of better times. Possibly it is not that brigandage increases, but that the resentment it awakens expresses itself more forcibly. Anyhow the industry of indignant journalists is able to collect a startling aggregate of unpleasant facts. We read of three persons being murdered at Tacubaya, which is as near to Mexico as Clapham is to Charing Cross. There is an alarming story of a printing office being broken into by masked ruffians, in one of the chief streets of Mexico, and of the printers being assaulted and robbed; and from one Mexican prison ten convicts are said to have quietly walked away in the full light of day. In the provinces, as soon as the passing detachments of troops are withdrawn, we find men of property and respectability carried off into the hills in order that a ransom may be exacted from them. A leading agricultural Association has addressed the Government, and has pointed out that the humble cultivators of the soil are constantly threatened and maltreated, and that the lives of the proprietors and managers of estates are in perpetual danger. What adds to the alarm is that the representatives of justice increase the reign of terror by sharing in, or conniving at, crime. In one district forty persons have come forward and accused three members of the Municipal Council of assassination, robbery, and a friendly understanding with the brigands of the vicinity. In the printing case an adjutant of police has been prosecuted because, when he had got one of the evildoers into his power, he simply let him go on his own responsibility. The mischief of applying the jury system to societies which are not fit for it has also made itself felt, and the Mexican public has been scandalized by a jury acquitting prisoners who had confessed their guilt, and owned that they had been parties to an attack upon a diligence and to the murder of one of the travellers. Society has been so much alarmed that a project of law has been drawn up which, if carried, will enact that cases of robbery with violence shall be withdrawn from juries, and submitted to the summary jurisdiction of judges acting with military rapidity. The great obstacle to the operation of such a law is that it is impossible to know whether those charged with its execution will carry it out. Mexican judges are too often the friends of the prisoners, and the worst brigands are too often the nominal guardians of the highway. But it need not be supposed that brigandage will always have the upper hand even in Mexico. The troops sent against marauders almost invariably do their duty; and a strong President, with money to pay an obedient army and with power to override the ordinary forms of law, might soon do much in the way of clearing the better populated and more fertile districts, and driving the scum of society into the remoter wilderness. Railways, too, are powerful counteracting forces to the vagaries and violence of outlaws; and the well-administered line from Vera Cruz to the capital is now almost altogether free from the attacks of the ordinary brigands of the country. Brigandage may perhaps be looked upon rather as a temporary, though serious, obstacle to the growing prosperity of the country than a permanent bar to all possible improvement.

DESIRABLE RESIDENCES.

THERE is wailing and mourning in the neighbourhood of Gloucester Road Station. In that district, at all events, the enterprising builder has been found out, and there is some danger lest enterprising tenants should migrate to some region less favoured by fashion, but more fortunate in its drains. The alarm is probably premature, because, however frightened house-hunters may be by such letters as those that have this week appeared in the *Standard*, they forget their terrors by degrees, and are more alive to the inconvenience of having no home than to the danger of having an unhealthy one. One of the correspondents of the *Standard* describes himself as having intended either to hire or buy a house near Gloucester Road Station, and as being deterred from doing so by the discovery that "there are "no plans of the drainage and sewer-pipes, and that no "one seems to know anything about it." For a time, no doubt, this gentleman's unwillingness to have anything to do with a house so ill-equipped as regards its sanitary geography will remain as masterful as it is now. By and by, however, he will find that other parts of London are equally ill provided in this respect, and that, as between two houses with unmapped drains, it is better to have one that suits him in other ways than one in which the want of a plan of the drains is only one of many other wants which, if less serious, are probably more obtrusively inconvenient. When once his reflections have taken this turn, the step to buying one of the very houses upon which his architect has reported so unfavourably will be a short one. A man has his wife or his daughters to consult in these matters, as well as his doctor or his sanitary inspector; and, unless they have already been frightened by typhoid or diphtheria, they are more likely to consider the advantages which the neighbourhood of Gloucester Road affords in the matter of afternoon teas than the fact that this cheering meal may have to be enjoyed in an atmosphere heavily charged with sewer gas. The indifference of the public to the most flagrant breaches of the most elementary sanitary laws is so deeply rooted that we have almost given up the hope of seeing anything done to put an end to them.

Yet, as regards newly-built houses at all events, the remedy is perfectly easy. In its application to houses destined for the poor it has often been preached in these columns; but it is very elastic, and perfectly capable of being applied to houses of a better class. It is simply this, that no house should be allowed to be let or sold for human habitation until it has been surveyed and reported wholesome by an official surveyor. A rule of this kind would keep the majority of those desirable residences which form the text of such letters as those in the *Standard* entirely out of the market. The rudiments of sanitary science are not so obscure that there would be any difficulty in laying down the conditions to which any house must conform before it can be described as fit for habitation. It should simply be enacted that no house should be inhabited until a plan of the drains had been deposited with the local sanitary authority, and until that authority had certified that the drains so mapped out were adequate to the work they had to do. In the particular house in which this correspondence had its origin the drains seem to have been faulty at every point. The builder had conceived a desire to ventilate them, but the pipe intended to fulfil this purpose "stopped far short of its proper altitude "and discharged the sewer-gas into a cistern from which the "daily bedroom water was obtained." In order, however, to make this nuisance less conspicuous, measures had been taken to prevent a good deal of the gas in question from ever reaching this cistern. The "drainage pipes up "and down the house were infamously leaky," so that the

sewer-gas would be impartially distributed through the atmosphere of the house, instead of being retained to pollute the water at the top. Still, if the occupier was imperfectly protected against disease generated in his own drains, he was entirely cut off from disease generated in other people's drains. The soil-pipe, instead of being connected with the main sewer, "simply made its own cesspool under the area flags." Now, supposing the builder of this house had been obliged to deposit the plans of the drains with the sanitary authority, and the sanitary authority had been bound to certify to the proper ventilation of the soil-pipe, to the soundness of the pipes passing through the house, and to the existence of a proper communication between the house drains and the main sewer, all these things would either never have been allowed to go wrong, or would have been put right before the house was lived in. The result would have been that the sickness which "DIOGENES" describes as having prevailed in the house for four or five years past would have been avoided. What there is to hinder the enactment of such a law as this we have never been able to understand. If no interference with builders were permitted, the position would be intelligible. There is always something to be said for doing nothing, and it may be argued with some apparent force that there is no more reason for interfering between a householder and his landlord, or between the builder of a house and the buyer of it, than there is for interfering between the wearer of a coat and the tailor who made it. As regards houses, however, the law already interferes. In London a Building Act of immense length and complexity is actually in force, and many things which, in comparison with such defects as those enumerated by "DIOGENES," are the merest trifles are strictly forbidden. The whole machinery of official supervision is already in being, and all that remains to be done is to apply it to drainage. It is quite clear that no house can be safely inhabited under the conditions described, and nothing could be easier than to provide that no house shall be inhabited until it has been ascertained that the conditions described do not exist.

When we come to houses already built and inhabited the difficulty is undoubtedly greater. Here the sanitary authorities are powerless, and it is not easy to see how the strength in which they are deficient can be supplied. Surveyors cannot be sent on roving commissions to pull every house in London to pieces on the chance—the very probable chance unfortunately—that something will be found amiss in it. The wholesale disturbance of existing contracts which such a crusade would cause would be productive of as much mischief as a faulty system of drainage. The tenant has in this case only himself to look to. He can refuse to take a house if he finds the drains do not do their work; and the more probable opinion seems to be that he can refuse to remain in a house where they are plainly unequal to the work they have to do. Either way, however, he must be prepared to incur expense. Still, if tenants became more alive to the importance of good drainage, the expense would soon be very much reduced. If landlords found that the condition of the drainage was habitually investigated by an intending tenant, they would be anxious to prevent the constant disappointments consequent on refusals to take houses which had been reported faulty, and with that view they would put the drains into good order once for all. So long, of course, as the great majority of tenants neither know nor care whether the drains of their house discharge themselves into the main sewer or into an extemporized cesspool underneath the basement, the few who really look into these things will have to pay for the many who take no trouble about them. The only comfort we can give them is that, even if the majority remain indifferent to the simplest requirements of health, it is worth the while of the minority to purchase the immunity from "smells and "sickness" which "DIOGENES" fondly thought he was to have without any special payment.

SOME PHASES OF AN OLD FEUD.

THE bitterest and the most prolonged feud that the world has yet seen is that betwixt the reviewer and the reviewed, or, to put it in the way most gracious to the latter, between the critic and the creator. So far as the outside world takes part in the quarrel, it sides always with the author or the artist. In the old legend of Apollo and Marsyas the relative position of the two is put in the clearest light. Every one sympathizes, of course, with the Sun God; and, of all those who have followed in the wake of Marsyas, none has dared to utter a word in his favour. Passing from the time of myths to that of which some kind of record is preserved, we find Bavius and Mævius faring little better than their predecessor, and undergoing a moral flaying not greatly to be preferred to the physical castigation of Marsyas. Scarcely milder has been the treatment awarded to the critic in England; where Pope, in an immortal poem, has held up to the ridicule of future ages every species of dunce, and especially the dunce of a critic. Modern writers have invented a whole scientific terminology to express contempt for those who venture to pronounce an opinion upon their work, and have tested to the utmost the power of the microscope to discover objects small enough and degraded enough in the scale of creation to serve as illustrations or parallels.

That portion of the world which attributes the bitterness of the quarrel to the fact that it is a domestic feud—the combatants belonging, in fact, to the same family—is wanting in a sense of the fitness of things, and displays an obliquity of vision analogous to that of the man who confuses a brewer with a publican, or supposes that selling a thing in threepennyworths is not altogether different from selling the same article in scores or hundreds of pounds' worth. That the critic's profession is not wholly vile is a view which may perhaps be defended on the ground that it is occasionally assumed by the creator. Dryden scarifying Shadwell, and addressing him as

> Thou last great prophet of tautology!
> The rest to some faint meaning make pretence,
> But Shadwell never deviates into sense;

Pope narrating how

> Night descending, the proud scene was o'er,
> But lived in Settle's numbers one day more;

and Byron deriding Coleridge as

> The bard who soared to elegize an ass—

are critics for the nonce. If this view of the matter be disputed, there is a second and more complimentary view that may perhaps pass. It has been the custom, in countries in which relics of feudalism remain and influence social customs, for the mere act of crossing swords with the king to constitute a patent of nobility. A similar theory might be maintained with regard to those whom the poet, who is surely a king, challenges to the duello. To speak seriously, however, it is strange that the quarrel between author and critic should be so envenomed when it is taken into account that there are few authors of eminence who have not been critics at one time or other in their lives. The difficulty, moreover, is not met by assuming the existence of inordinate vanity on the part of the criticized, or confirmed malignity on that of the critic. There are few writers of position who will not admit that, at the outset of their careers, they received support and stimulus from the recorded praise of men who were strangers to them. Not until their position was established, probably, did they find that criticism, instead of an aid and an ally, had become an obstacle and an enemy. Jealousy on the part of the critic of the distinguished position now attained by the criticized is an easy and a flattering, albeit an absurd and utterly erroneous, explanation of the phenomenon. Those who are in the least degree behind the scenes know that all explanations which rest upon the assumption of animus in the critic are delusive and ridiculous.

It seems worth while, then, to inquire into the cause why the warm reception that generally attends all work in which there is either promise or performance should in many instances be succeeded by coldness, or what looks even like hostility. Some more or less familiar analogies will do something towards explaining how this may occur without there being the slightest room for a charge of disloyalty or unkindness. Who that has mixed much with his fellow-creatures and "seen many men and cities" has failed to encounter once or twice in his life some person whose exceptional brilliancy of mind, originality of thought, extent of information, or the like, has seemed to put to shame the more commonplace possessions or faculties of older friends? An intimacy is eagerly sought and obtained. As time passes on, however, the method and the range of accomplishments of the new friend become apparent. Every meeting divests him of a part of the glamour with which he was at first surrounded, and in the end he stands before you a worthy and an able fellow nowise distinguishable from a score of others in whose intimacy you rejoice. We have here a complete illustration of the effect produced by some great luminary who "swims into our ken." If a new volume of poems, for instance, appears in which the presence of the divine afflatus is distinctly revealed, everything about it is new, startling, and calculated to provoke admiration or opposition. One volume is enough to disclose the possession of genius; two or three volumes indicate, except in the case of a really great man, the nature of his method and the limit of his powers. It is frequently said that an author is his own worst enemy, and that the comparison with his own previous accomplishments is the most dangerous to which he can be subject. This is true so far as it detracts from his originality and shows him to be copying himself. It is impossible to imagine an audience finding recollections of *Macbeth* spoiling its enjoyment of *Hamlet*, or thoughts of the *Tempest* interfering with the pleasure derived from *As You Like It*. *Pickwick* did not stand in the way of *David Copperfield*,

Vanity Fair did not detract from *Esmond*, *Les Chansons des Rues et des Bois* spoilt nowise the flavour of *La Légende des Siècles*. As soon, however, as signs of limitation of power are afforded, the author's past work stands in the way of his present.

There is, however, another source of disagreement between author and critic which differs from the foregoing, though it is related to it. This is perhaps best illustrated in the case of the actor. Graces of style have a perpetual tendency to develop into tricks or to harden into mannerisms. A man who has lived long and kept his eyes open can recognize the grimace in the smile, and can see in the very charms of youth what will in time become quaint, curious, or repellent. It is impossible for an observer to pass along the streets without noticing the marvellously fantastic appearances into which faces occasionally harden. A trick of turning up one side of the upper lip, for instance, which in a young person exercises over another of opposite sex a witchery so great that a face without such a trick is incapable of greatly pleasing, produces sooner or later a partial distortion of feature; a constant elevation of the eyebrows may communicate in time an expression of absolute imbecility. Here again a serviceable, if not an exact, analogy is supplied. An actor while still young comes on the stage, and displays more or less fitness. As criticism is for the most part masculine, let us suppose the artist to be a woman. She obtains almost to a certainty a warm reception, very probably an amount of eulogy absolutely misleading. As she plays, however, and finds the reward of laughter or applause that attends upon certain graces, she repeats them until they become tricks. In the end she is probably *maniérée*, or affected with vices of style that approach caricature. One of the most distinguished English-speaking actresses this age has seen has thus accentuated her style until it has reached absolute caricature, and is so artificial and false that it ceases to claim recognition as art. It would be easy from those now on the stage to draw further illustrations. The actress, then, whose *début* elicited a verdict unanimously favourable, and who at the outset found the critics her allies and friends, when she fails to obtain equally favourable notice, not only says, but believes, that some motive is at work. She has passed unintentionally some slight upon her censors; she has neglected to propitiate them in some unknown fashion; they are—for the range of feminine conjecture is wide—in love with a rival. Any reason is good except the right one.

The actress has been selected as illustrating this analogy for the reason that in her case it is most easily apparent. It holds true, however, in every form of literature and art. There are few men whose work in its developed beauty is equal to the supposed promise of its youth: there are not a few in whose writings mannerisms exercise a most disturbing influence. It would be ungracious to mention names of living writers or those recently dead in support of this view. Who is there that is familiar with literature that has not grown tired of a crabbedness of style in dealing with historical subjects which, for a time, had a pleasant smack of originality? Who, in "sensational" fiction, has not felt annoyance when the pardon accorded in the case of one work of transcendent interest to a faulty and inartistic device has induced the author to incorporate into his method and employ constantly that which is barely condonable in a single instance? Who has not felt that the practice of assigning in an especial degree to the Almighty the things it was sought to render impressive, and speaking of "God's sunlight" as though moonlight or starlight belonged to some other power, produced in the end a sense of weariness? It is, of course, vices of style which are most easily and most constantly copied by the disciples whom a great man is sure to attract. *Marivaudage* was not incorporated into the French language as an indication of affected refinement of style on the sole strength of Marivaux. The style known as Byronic derived its name from the followers of the poet, not from the poet himself. In the poet, however, might be found the mannerism the full ugliness of which was more easily discernible in a more commonplace visage. It is natural, and indeed inevitable, that the change of front of criticism, when, after commencing with eulogy, it continues or ends with censure, should produce in the writer or the artist a feeling of depression or defeat, the more so as a similar change is likely to be manifested by the public. Not seldom the artist or the poet whose nature is the more feminine is stung to something like frenzy. The serene atmosphere of Olympus even is troubled when, instead of the voice of adoration, there mounts that of complaint, and the singer who would scorn to measure swords with the critic may yet stoop to counsel in rebuke:—

> Vex not thou the poet's mind
> With thy shallow wit.

The more virile, if more commonplace, organization may learn from censure lessons of the highest value. To the actor to whom applause is the very breath of the nostrils the absence of the required support or stimulus means death. A singular and deplorable instance of the truth of this is found in the career of a great artist recently dead. When, with a reputation from the Odéon and the Théâtre Français, Fechter appeared in London, he caused a pother with which the most exacting of men might have been satisfied. His Hamlet stirred more interest and provoked more discussion than perhaps any previous performance of Shakspeare within the memory of the present generation. *Ruy Blas*, the *Corsican Brothers*, and other impersonations on which it is needless to dwell, showed the versatility and the power of the actor, but indicated also his range. The public did not fail the artist; it simply assigned him his place—a high one—among his fellows. To the average mind this is success and distinction; to the artist alone can it present any suggestion of defeat. An ill-judged expedition to America, and a star the less in an English firmament not too richly studded, were the consequence of criticism, professional and popular, assigning a fine actor his proper place in the hierarchy of his art.

It is of course hopeless to think of ever making a real peace between the two powers who are thus at constant feud. In times when the recording of a literary verdict took the shape of moral arraignment, and when rashness or innovation in matters of expression was held to justify the imputation of every form of personal depravity, criticism was not more unpalatable to the creator than it is now, when, in the freely expressed opinion of the outside world, it is not seldom indulgent to an extent that deprives it of all claim to consideration. Without going back to the time of Salmasius, one has only to read the recorded verdicts of men like Jeffrey, or even of Leigh Hunt, to notice the change that has come over criticism. The same voice that used to roar so that it would "do any man's heart good to hear" is now so "aggravated" that it roars "you as gently as any sucking dove," and yet it fails to please. The position, indeed, seems not unlike that of the hangman, with regard to the subject in his hands, who found that, whichever way the noose was adjusted, there was no pleasing its occupant.

M. RENAN AS A LITERARY THEOLOGIAN.

THE very interesting and suggestive paper on "Ernest Renan" which Mr. Saintsbury has contributed to the *Fortnightly Review* opens with a disclaimer of any intention to deal "with matters theological." And neither shall we deal with them in the sense of discussing the truth or falsehood of M. Renan's theological views. But the characteristic peculiarities, and, as we should be disposed to call them, characteristic faults, of M. Renan's theological method, are so strictly analogous to the peculiarities of his literary method generally, if not identical with them, that the one cannot be criticized without virtually criticizing the other also. And in fact a great deal of Mr. Saintsbury's criticism does apply equally to both, even where he is not expressly noticing what must, we suppose, be considered M. Renan's principal works, and those by which he is certainly best known in this country, his six volumes on the *Origins of Christianity*. We may go further and say that M. Renan's characteristic weaknesses are distinctively those of a theologian, while it is in subjects of this kind that he appears to be chiefly interested. And here Mr. Saintsbury will bear us out, for he observes, very justly, that "M. Renan's two wings are the abstractions which are called, in the technical terms of theology and morals, spirituality and unction"; and again that he has a special tendency not so much to put himself in the place of the subjects criticized, as "to improve them, in the ecclesiastical sense, that is to say, to use their history and peculiarities for the purpose of illustrating his own ethical, religious, and political ideas." And he tells us further that the *hautes études* which M. Renan is so anxious to see more energetically cultivated in France do not include mathematics or abstract philosophy, but do include the study of religion. All this may be partly due to his ecclesiastical training, but at any rate it is a fact, which alone concerns us here. We conceive then that in examining M. Renan's speciality in that character by which he is most familiarly and widely known to English readers, and which moreover appears most naturally to belong to him, we shall at the same time be indicating his literary speciality generally. And here we find ourselves in substantial agreement with Mr. Saintsbury's estimate. He has very happily taken for his point of departure what he holds to be a fair summary of the unfriendly, but not therefore uninstructive, critique of Mérimée on M. Renan, as a writer whose aim is "to dress up life in bright colours and agreeable forms, and to express these in somewhat effusive and voluble language, full of unction, and of appeals to the heart, the sentiments, and the religious principle." For the last words we should be inclined to substitute "religious feeling"; "religious principle," as will appear, is precisely what M. Renan not only never appeals to, but instinctively repudiates or ignores.

The point too which we should fix upon as supplying the key to M. Renan's theological method, and which shall be illustrated presently from the latest of his public manifestoes—the lecture he delivered a fortnight ago on the Emperor Marcus Aurelius—may be gathered from the following very pertinent comment on the *Vie de Jésus*:—

> To take a connected narrative and reject such details as happen not to square with preconceived ideas, while admitting the others; to reject a prophecy as obviously false, and take it up next minute as a trustworthy history of the events *à posteriori*; to see in a reported miracle, not an imposture, but an innocent distortion of some ordinary fact—all this seems at first sight to partake decidedly more of the spirit of *Dichtung* than of *Wahrheit*.

A page or two later the reviewer remarks that M. Renan's next work, *Les Apôtres*, has been, not without considerable reason, designated a romance. He prefers himself to call it "a conjectural restoration of history"; but the distinction of name is immaterial, for he at once adds, what is obvious, that "all conjectural restorations incline to the romantic." Now it is exactly this systematic preference of *Dichtung* to *Wahrheit*, or rather substitution of the one for the other, that lies at the root of M. Renan's entire

method. It is not that he has formed a wrong judgment as to what is the truth—that question would of course necessarily open the way to endless differences of opinion—or even that he is careless about it; it is that he refuses on principle to inquire whether there is any truth at all, and insists that, whether there is or not, our best wisdom is to remain in ignorance of it. "His gospel," according to his critic, "may certainly be said to be a vague gospel." It would be more accurate to say that vagueness is the essence of his gospel. Mr. Saintsbury's article closes with the expression of his anticipated interest in M. Renan's forthcoming volume on Marcus Aurelius. We have already the advantage of knowing something more about it than Mr. Saintsbury did at the time of writing, from the full reports which have since appeared of M. Renan's elaborate lecture on that subject at the Royal Institution. And it does certainly illustrate and accentuate with remarkable distinctness the impression we had gathered from other sources of his leading principle. The crowning merit of the *Meditations* of Marcus Aurelius is declared to consist in his affirming no dogma, and having no dogma to affirm. To read them "leaves in the mind a void at once delicious and cruel, which one would not give in exchange for complete satisfaction." The writer is a perfect ideal precisely because "he floats between pure theism, polytheism, and a sort of cosmical pantheism," and had no "determinate religion," or "speculative philosophy," and "had formed no idea about the soul and immortality." A passage from one of his Hibbert Lectures about "a fatherly glance looking over the universe" has been frequently quoted of late as evidence of a recantation of scepticism or an avowal of theism on M. Renan's part. It would not be difficult to quote other passages from the lectures looking in an opposite direction, and the lecturer himself would have no desire to disclaim or explain away the contradiction; he tells us plainly in his latest lecture that he "wants the future world to remain a riddle," and, if any "brutish proof" were offered, would refuse to go and see it. It was the special praise of the Imperial philosopher that "his theology was made up of contradictions, and he never cared to put himself in harmony with himself as to God and the soul." This is at least plain speaking, and it is fully borne out by the testimony of M. Renan's previous works. It is not simply, as we have already intimated, that there is a negative side to his theology, or even that it is chiefly made up of negations owing to the large number of questions on which certainty appears to him unattainable. To him theology is nothing, if not negative; negation is the very breath of its life, the atmosphere in which it lives and moves and has its being. To grasp at certainties is to sacrifice ideal perfection, and the true gospel blessing is for those who have not believed, because they have steadily refused to see. There is a sort of vulgarity in pinning one's faith on facts; and Christianity is not the less beautiful for being based on an *Aberglaube*. "The needs which Christianity represents will abide eternally," and have been admirably satisfied in the past by a creed which owes its success to the happy accident of the zeal of a female enthusiast who secured currency for the fable of the Resurrection.

It is clear of course that the habit of thought which finds expression in such views as these cannot be confined to any one subject-matter. M. Renan applies it to history and philosophy just as much as to theology. His conjectural emendations of history are not restricted to the apostolic age. We do not mean to imply that he deliberately romances. Mr. Saintsbury may be quite right in saying that there is a sobriety about him which certain historians of the same general character in England might do well to imitate, and that "he is not in the habit of basing rhetorical generalizations *upon nothing at all*." We have italicized the last words, because his generalizations are undoubtedly apt to be based on a very slender induction. When his critic affirms that "he can rarely be accused of actual exaggeration," we must presume exaggeration of detailed points of fact to be intended. He had himself called attention not long before to the wonderful meanings extracted by M. Renan out of the callous knees and golden mitre of St. James the Less, which the Apostle himself would probably have been the first to repudiate, and he points out soon afterwards how his whole conception of the middle ages is not so much an exaggeration as a paradox. To describe that period of European history as "representing intellectually nothing but groping after a return to antiquity," is a startling specimen of "conjectural restoration," to say the least of it. And the explanation is not far to seek. It is not the religious aspect of the middle ages, as such, that repels M. Renan; it might even have its attractions for him. But there was a sternness, a decision, a terrible earnestness about that phase of social life, which he cannot away with; the warlike temper is especially distasteful to him. And as in history and theology, so in speculation, he dislikes what is peremptory and precise. Marcus Aurelius, as we have seen, is commended for his freedom from positive beliefs in philosophy as well as in religion. Scholasticism and modern German philosophy are alike coldly, if not harshly, dismissed. There is not sufficient warmth, and brightness, and human interest about them, and in philosophy, as in religion, the notion of attaining abstract truth is a mistake. "Science will for ever pursue without ever attaining the formula of this Proteus." It seems hardly respectful to speak of "gush" in connexion with so accomplished and brilliant a writer, yet there is a sense in which it would not be incorrect—as Mr. Saintsbury himself hints in one passage—to say that a certain highly idealized and picturesque form of gushing is characteristic of his literary method throughout. This is the impression inevitably produced by his style and on readers, and still more on hearers, of his brilliant periods, particularly on English readers, who are apt to grow a little impatient of being cloyed with "delicious" and "charming" and "ravishing" and "exquisite" morsels in almost every page. But this too belongs to the literature of edification, especially in its French variety. And M. Renan, as was observed before, is always improving the occasion. He would have created a sensation second only, if second, to Lacordaire in the pulpit of Notre Dame. It is hardly perhaps a gratuitous suggestion that he may yet cherish the hope of one day appearing there. Mr. Saintsbury expects to find in his promised volume on Marcus Aurelius "a development of the eloquent projects of reformation in which he has more than once hinted that the Church of Rome might, if she would consider the things that belong unto her peace, be called upon to bear a part." We ourselves pointed out on a previous occasion that M. Renan had in him the elements of an Ultramontane as well as of a sceptic. A Christianity which is not Catholicism, or a Catholicism not predominantly Roman, is to him scarcely intelligible; and Protestantism, if it is understood to mean a protest against the assumed false doctrines of the rival system, is self-convicted of repeating in an aggravated form the original blunder of dogmatizing about truth. The future of Christianity, if it is to have a future, must inevitably be bound up in his mind with the continued spiritual dominion of Rome. And to him it would not appear incongruous, or beyond the range of at least distant possibilities, that Rome should consent to take the lead in some grand scheme of social regeneration, which began by relegating to the category of open questions what have hitherto been regarded by every Church, and indeed in every religious system which has exerted an influence among men, as elementary postulates of the very idea of a religion. There is a practical difficulty about this view which can scarcely have escaped his notice, but which probably does not trouble him. Let us grant for argument's sake the abstract perfection of the creed, or rather creedlessness, of the Stoic Emperor. It may have been "delicious," but, on his panegyrist's own showing, it did not prove a working religion, but much the reverse. Facts are stubborn things, and we are afraid that the Church, whether Roman or non-Roman, will pertinaciously decline to accept the programme M. Renan kindly offers her, and would infallibly bring herself and her "seriously modified" Christianity to rapid destruction, if she did accept it.

ISLE OF WIGHT ELECTIONS BEFORE THE REFORM BILL.

NOW that the country has just been passing through the excitement and turmoil of a general election, it may not be out of place to take a glance backward into the past and see how they managed elections in the good old days before the Reform Bill. The district from which we shall draw our examples is the Isle of Wight, in whose electoral history we can as clearly trace the successive epochs in the development of our representative system as in its geological structure we discern the phenomena of stratification. It is somewhat difficult to realize the fact that half a century since, at a time when Manchester, Birmingham, and Leeds had been long knocking in vain at the doors of St. Stephen's, this sleepy little island, with a population then numbering only twenty thousand, should have been represented in the House of Commons by not fewer than six members. These members were assigned in pairs to the boroughs of Newport, Yarmouth, and Newtown, of which the last two had sunk to the level, the one of a small village, the other of a sparsely populated hamlet. But, small as the population of these boroughs was, the inhabitants had no share whatever in the return of their nominal representatives. The whole number of so-called electors in the three collectively fell short of a hundred, and these, like obedient peace-loving burgesses, never presumed to have a will of their own, but voted according to the behests of the two or three leading families who then swayed the politics of the island. A solicitor of Newport has boasted, in the memory of persons still living, that he absolutely returned five out of the six members, and that the sixth, if he (the solicitor) frowned upon him, would stand but a poor chance of securing his seat. It is fair, however, to add that this gentleman is not commemorated as having ever sent to Parliament representatives for supporting whom their friends had afterwards to apologize. It is not surprising that the Reform Act ruthlessly disfranchised the two smallest boroughs, and, taking away one member, threw the franchise open at the only town of the three, Newport, that had any claim to Parliamentary honours.

The Parliamentary history of the Isle of Wight is the Parliamentary history of England in little. It dates, like that, from 1295, "the real and true epoch of the House of Commons," as Hume has called it. Among the burgesses then first bidden to the "Great Council of the Realm" from every city, borough, and leading town, to sit side by side with the knights, nobles, and barons, was one from each of the towns of Newport and Yarmouth. Newtown—or "Francheville," as it is called in the original charter of Aymer, Bishop of Winchester, of whose episcopal manor of Swainston it had formed a member from the time of Egbert—had suffered too severely from piratical raids, the frequent recurrence of which, fostered by the easy landing and safe anchorage afforded by its muddy inlet, were its eventual ruin, to substantiate

a claim for representation. But the Parliamentary dignity of the Isle of Wight was suspended almost as soon as it began. The Parliament of 1295 seems to have been the only one for nearly three centuries in which any members for the Island sat. This, as we all know, was by no means an exceptional fact. The now much coveted honour of returning members to Parliament was, at the end of the thirteenth century, regarded as so burdensome a privilege—involving, as it did, the payment of two shillings a day for the maintenance of their representative—that the boroughs used all means in their power to get rid of it. More than a third of the 165 boroughs which obeyed the King's writ in 1295 contented themselves with a single compliance with the Royal summons. The decayed town or village of Brading on the eastern side of the Island, though its name does not appear on the Rolls of Parliament, is believed on good grounds to have had a representative assigned to it, and to have been relieved of the burden on its own petition. Whether Newport and Yarmouth resorted to this ignominious means of self-extinction, or whether they were unable to find representatives able and willing to undergo the expense and trouble of a journey to Westminster, we are not informed. Even in James I.'s time old Sir John Oglander tells us that the well-to-do islanders seldom or never crossed the Solent, "making their wills when they went to London, thinking it like an East India voyage; supposing no trouble like to travaile," and holding so little intercourse with the outside world that they were content to entrust their letters, when they had any, to "a coneyman who came from London to buy rabbits."

Whatever may have been the cause, the right of returning representatives for the boroughs of the Island slept till 1585, when Elizabeth, with the view of neutralizing by management an opposition which the Crown could no longer overawe, made a large increase to the numbers of the House of Commons—"some indeed," to quote Mr. Green, from "places entitled to representation by their wealth and population; but the bulk of them small towns or hamlets which lay wholly at the disposal of the Royal Council." The insignificance of Yarmouth and Newtown (which were now for the first time created Parliamentary constituencies) shows clearly enough the Queen's object. And here, at any rate, disappointing as was the result elsewhere, her end was fully attained. Nothing like an independent exercise of the franchise was known in the Isle of Wight from the first. The right of appointing one of the members, "for us and in our names," was at once made over by the burgesses of Newport to the spirited "Captain of the Isle," Sir George Carey, Elizabeth's first cousin, "during his natural life," as a token of gratitude for the restoration of their electoral privileges. At Yarmouth, left a heap of smoking ruins by the French in 1544, and even at the beginning of the last century scarcely numbering eighty houses, both the representatives were nominated by Carey from the beginning. A curious picture of the way members were then returned is afforded by a letter of Carey's, then become Lord Hunsdon, to the Corporation of Yarmouth, September 10, 1601, desiring that,

inasmuch as I was the Means and Procurer of the Libertie for your Corporation, you will with all the Convenience you may, assemble yourselfs together, and with yr united Consent send up unto Me (as heretofore you have done), ye Writt with a Blank, wherein I may insert the Names of such Persons as I shall think fittest to discharge the Dewtie for your Behoofe.

Sir George Carey's successors in the Governorship—a title which, not without protest from the independent gentry of the Island, began to take the place of the old "Captaincy"—did not allow the prerogatives of their office to lessen in their hands. A letter from Henry Wriothesley, Lord Southampton, who followed Carey as Governor, to the burgesses of Yarmouth, who had ventured to promise a vacant seat without consulting his wishes, shows that the slightest approach to independence of choice was sufficient to awaken the warmest indignation. This letter, which we copy from an autograph, and which has, we believe, never before been printed, runs thus:—

To my loving Frendes the Mair and Burgessis of Yarmouth in the Isle of Wight.

Whitehall this 19 of Februar. 1603.

It cannot but be straunge unto mee that by waie of prevention and cunninge you have provided rather to make excuse then to yeelde satisfaction to my reasonable requeste. I should approve yr reasonable aunswere concerninge Mr. Cheeke if first you had acquainted mee therewith. Your forehand promise made I shall find means to prevent, and shall have occasion to note your little love and respecte to mee your Countryman and frend. In that I am not satisfied with yr former aunswere I have sente my servaunt unto you desiring that you give him hearing that by him you maie more plainlie understande my mynde. So expecting yr kynde usage I remaine

Your louinge frend

H. Southampton.

So alarming a menace had the desired effect. At the next election, in 1614, Lord Southampton's eldest son, Thomas Wriothesley, made application for one of the seats; as a matter of course he was returned, and sat for the borough till his father's death transferred him to the House of Peers. We append the letter of Wriothesley—or, as he signs himself, "Risley," a curious example of the phonetic spelling of the day—which has never before been printed:—

To the worthy my verie lovinge frendes Mr. Thomas Cheeke, Esqr., Mr. Barnaby Leigh, Mr. Thomas Urry, Mr. James Gyer, and the rest of the Burgesses of the Town of Yarmouth.

Sir,—To yr letter wh was directed to my Lord for disposinge of Burgesshippes for the parlament, Captain Burleigh that is a member of yr toune hath recevyd answere. Neither is it his Lordship's pleasure to name any other than Mr. Bromfield, that hath bene formerly named by you to one of them, leavinge the other to be disposed of you. Yet this it pleased his Lordship to say, that if the towne would willingly doe me the favour to name me for the second, he wd take it from you as great respect done unto his Lordship. And since I am well knowen to you and some of the Burgesses of the Corporation, I shall desire yours & their voyces herein, which I shall deserve on any occasion you shall use me in, and always rest

Yr verie assured lovinge frend

[No date.] Tho. Risley.

The influence of the Governor was equally great in the little borough of Newtown. On the occasion of a vacancy Southampton writes thus:—

The 16 of Apr .... [year lost].

To Sir William Mewes, Member for Newtown.

Sir,—I wrote lately unto you to desire that uppon the sendinge of a new writt you would change the name of the Burgess of Newtoune wh you bestowed uppon mee, Mr. George Stowton beeinge chosen for Gulford & servinge in Parl. for that towne. I have now sent you the writt, prayinge you to make choice of Sir Henry Barkley, & to returne the Indenture of Election unto mee as sone as conveniently you may, & I will account my self behowldinge to you for it, and so recommendinge my self kindly unto you

I rest your very assured frend

H. Southampton.

When Charles I., after eleven years of personal government, by the advice of Strafford and Laud summoned the "Short Parliament" in the spring of 1640, William Oglander, a son of the staunch Royalist, Sir John Oglander, of Nunwell, their previous member, was chosen, with Philip Lord Lisle, by the Corporation of Yarmouth to represent them. The choice was not at all to the young man's liking. He was a hot-headed, imperious young fellow, and rated the Corporation soundly for imposing duties on him which he seems to have thought beneath his dignity. They were "an ill-bred company of fools and loggerheads," "a meaner man than he might have served their turn," "What good or harm could he do them?" "He might make the town bear his charges, but he would not be so base as that," "but he would be quits with them." The good women in whose hearing he had poured out his discontent—both burgesses' wives—Mistresses Hyde and Burley—the latter the wife of Captain Barnabas Burley, tried and executed at Winchester in 1647 for a rash and utterly unsuccessful attempt to raise the people of Newport for the release of Charles I., who about a month before had become a prisoner at Carisbrooke Castle—notwithstanding the earnest entreaty of Oglander's serving-man that "there might be no words of what his young master had spoken," told their husbands what had occurred. The matter appeared so grave to the sapient Corporation that a meeting was summoned to consider the headstrong young man's "misdemeanour," at which he was solemnly "dismissed and excluded" from his office, as being "altogether unfit to be a Burgesse for the Parlyament," "John Bulkeley, Esq." being chosen in his room. After a three weeks' sitting, the Parliament was, as we know, roughly dismissed, to be succeeded in November by the "Long Parliament," in which Bulkeley sat for Newtown with Sir John Barrington, being "voted in by the House of Commons in the room of Sir John Mewes and Mr. Weston"—we presume on petition.

The Burgesses of Yarmouth made another ineffectual attempt to assert their independence when, at the close of the century, Sir John Cutts—the daring hero of William III.'s campaigns, who, having shown himself "the bravest of the brave" at the battle of the Boyne, gained the nickname of the "Salamander" by his gallantry at the siege of Namur—retired to the Governorship of the Island as a comfortable sinecure, 1692-1706. The imperious old General, accustomed to military obedience, sought to overawe the electors by arbitrarily quartering soldiers on them, and threatening those who refused to follow his dictation that he would "use his power over them as enemies to the Government," and actually imprisoned one of the clergy of the Island for two months in West Cowes Castle for voting against his interest. The burgesses having petitioned against these "illegal and arbitrary acts," the old fire-eater,

As brave and brainless as the sword he wore,

was brought to reason, and a compact was come to between him and the Worsleys, and the other leading inhabitants of the island, for "a sincere and lasting friendship;" in which, however, Cutts came off victorious, an engagement being entered into that "the Governor's recommendation, when any persons stand for Parliament men, should be preferred to any others not being of the Island." Cutts's predecessor, the unscrupulous soldier of fortune, Sir Robert Holmes (1667-1692)—who, joining the other service, reached the highest naval dignity for his exploits against the Dutch—founded a family (now represented in the female line by Lord Heytesbury), which adroitly secured to itself the lion's share of the representation of the island. Before the Reform Bill, the two members for Newport, as well as those for Yarmouth, were nominated by the Holmes interest. It was also influential at Newtown, though partly neutralized there by the union of the Worsleys and the Barringtons, who together possessed the greater part of the thirty-nine small plots of ground known as "burgage tenements," which conferred the right to vote. This "patronage" was swept away by the Act of 1832, which reduced the representatives of the Island to a third of their previous number, giving one to Newport and one to the "County of the Isle of Wight." Before this Act the members for Newport were nominally elected by the twenty-four corporators, whose freedom of choice was about on a par with that

of a Dean and Chapter under a "*congé d'élire*," the inhabitants usually knowing nothing of the fact of the election till they heard the bells ring for the successful candidates. At Yarmouth the choice of members was also vested in the burgesses, who, nearly all unconnected with the place, were chosen from private friendship or connexion with the family of Holmes, as a convenient instrument for retaining the political patronage of the borough. Their numbers were reduced to the narrowest possible limits in order to guard against the possibility of opposition, *nine* being the largest number of electors who had polled for thirty years before its disfranchisement.

The ceremony of election in the Isle of Wight boroughs was, we are told, "a very simple and agreeable one, a dinner constituting its chief and most popular feature." At these times the dilapidated Court House at Newtown—there was little difference in the proceedings at Yarmouth—was the scene of protracted feasting. At noon the burgesses sat down to an oyster luncheon, for which the lessee of the haven was bound to find the staple material. Before the delicate molluscs had been fairly digested the company assembled again for a plentiful cold dinner, washed down with abundance of port, claret, sherry, and strong ales. Then the chairman drew from his pocket a card bearing the names of the two new members. These he read aloud, when they were at once proposed and elected, and their health was drunk "with the utmost enthusiasm."

Let us turn for a moment to another and perhaps equally important side of the picture. The argument currently urged fifty years since for the continuance of these "nomination boroughs," that they opened the door of the House to rising young statesmen, and secured the return of men whose presence was essential to the satisfactory conduct of public business, was strikingly exemplified in the Isle of Wight. It was as member for Newtown that Canning was first brought into Parliament by Pitt in 1793. The Duke of Wellington, then "General Sir Arthur Wellesley," entered the English House of Commons as representative for Newport, his fellow-member being "Henry, Lord Palmerston"; and Lord Lyndhurst, then Sir John Copley, was returned in 1818 as representative for Yarmouth, for which Sir Philip Francis had sat in 1784. The electoral history of the Isle of Wight is distinguished by other great names. In the Long Parliament Lord Falkland, the purest patriot of the Royalist cause, sat for Newport, and Philip, Lord Lisle, the gallant brother of Algernon Sidney, for Yarmouth; while the green lanes and humble cottages of that *nominis umbra*, Newtown, recall the memories of John Churchill, the future victor at Blenheim, and the whilom tailor's boy of Niton, Sir Thomas Hopson, the hero of Vigo Bay, who were returned as its members in 1678 and 1705 respectively.

VILLAGE DOCTORS.

FOR a man who is fond of his profession, and enjoys outdoor life and amusements, the position of a country doctor has many advantages. Though not so profitable as a town practice, it is more certain; for there is generally less competition, the abilities required for a successful career are not so great, and, above all, there is not the same necessity for an elaborate keeping up of appearances. A village doctor with sporting tastes has, as a rule, sufficient opportunities of enjoying his favourite amusements without interfering with more serious affairs. The delights of a day's shooting are, like other pleasures, increased by their comparative rarity, and lose nothing even from the knowledge that they may be at any moment interrupted. The doctor's social position, too, is generally agreeable enough. People whose main object in life is the attainment of rank among county families may hesitate to visit him; but those who are already safely established within that mysterious circle can afford to be less particular, and the estimation in which a newly-arrived doctor is held by them will depend very much upon his taste for rabbit-shooting and his powers of riding across country. If he is a bachelor, he will find himself even a more interesting object than the curate to all but the most devoutly disposed spinsters of the place; for, as it is an axiom that a doctor must be a married man, there is more ground for immediate hope in his case than in the other. We once knew a young doctor who was negotiating for a practice which was offered to him on very advantageous terms, and would certainly have concluded the bargain but for a hint that he was expected to take over with the practice his predecessor's only daughter. A little local influence is of great importance to a beginner. What are known as the "appointments"—the Workhouse, if there is one, and the various benefit clubs, "The Independent Odd Fellows," "The United Mechanics," and "The Amalgamated Ploughmen"—form, if not the most remunerative, at any rate the most trustworthy, sources of income. Moreover, their possession acts as an advertisement; they lead to private practice; and a doctor, even though he may not care to have them, can seldom afford to leave them to a rival.

There is no science which has to be so much modified by reference to popular prejudice and superstition as medicine. A young doctor may come fresh from his hospital course, full of sound theories on the conditions necessary to health, and on the impotence of drugs to counteract an unwholesome way of life; he may resolve never to give medicine unnecessarily, or to "exhibit" elaborate remedies when simple ones will answer his purpose; but he will soon find that he must either alter his determination or lose his patients. Since the days of Naaman the Syrian, simple remedies have always been suspected by the ignorant, and to suggest to a dyspeptic farmer that his illness may be cured by such commonplace means as abstinence from indigestible food, or reduction of his consumption of beer and spirits, is regarded by the patient as a gross personal insult. It is a reflection on his constitution, and tends to reduce his malady to the level of ordinary ailments. Such people are apt to argue, like Mr. Nadgett in *Martin Chuzzlewit*, that it is their own liver, and they ought to know whether there is anything seriously the matter with it or not. Many of them, moreover, do not, to borrow the language of *Henry's Latin Exercises*, eat to live, but live to eat, and they hold that a bottle of good strong physic at once relieves the system from the uncomfortable effects of over-indulgence, and clears the way for further gratification of the appetite. Any ulterior consequences of such a method will concern the doctor should they ever arise, and meanwhile they are too remote to come within the sphere of practical hygiene. Patients of this class, too, are always very anxious to get their money's worth, which they measure by the size of the medicine bottle, just as they judge of the doctor's skill by the strength of his drugs. However excellent his intentions, the time comes when he finds it necessary to give up his common-sense methods of treatment, and to order an extra supply of Epsom salts, and such cheap medicines, from his drysalter. He has still, however, something to learn before he is fully qualified to minister to the tastes of his clients. A simple solution of Epsom salts is colourless, and is therefore regarded with suspicion. It leaves too much to the imagination, and does not by its mere appearance inspire that implicit faith which it is so desirable to kindle in the patient's mind. The idea of strength is what must be conveyed, and therefore those delicate tints of transparent red and clear golden yellow with which a town chemist delights his lady customers are quite out of place, for they are suggestive of refinement rather than power. The judicious doctor adds to the row of bottles on his surgery shelves a large one containing a dark brown viscous fluid. A few drops of this impart to the most harmless-looking mixture a richness of colour which carries conviction with it, and even induces patients to pass over any deficiency of nastiness in the matter of taste. This bottle is regarded with awe and admiration by all who are admitted into the surgery; and until a beneficent Government has introduced the study of Latin into village schools, country people are not likely to discover that the mysterious words SACCH: UST: which appear on the label mean nothing more or less than burnt sugar. Meanwhile this one bottle does more than any amount of tact on the part of the doctor to reconcile medical science with vulgar prejudice. But, while he must be careful not to wound the delicate susceptibilities of his patients by prying too closely into the secrets of their inner man, he must be fully as cautious not to offend the squire of the parish. It is obviously not his business to point out that an outbreak of typhoid may result from the open drain which runs past a row of cottages, or to suggest that rheumatism is attributable to damp floors, and bronchitis to badly built walls. His function is to cure disease, not to prevent it, nor to make the tenantry discontented with their position by airing his sanitary crazes. As his office of physician in ordinary to the servants at the Hall depends on his deference in such matters to the squire's opinion, he is wise not to raise those questions which the outbreak of an epidemic or the prevalence of colds and agues may suggest.

Even if the village doctor contrives to make his practice square with the theories of his patients and the interests of their landlord, he still has powerful rivals to contend with. The nearest market town is probably overcrowded with doctors, who try to enlarge their practice by encroaching upon the sphere of any country practitioner within their reach. The smart cab or neat brougham of the town physician inspires the rustics with a reverence which the familiar gig has no power to excite; while the liveried groom or coachman seems a very different being from the youthful factotum whose temporary dignity, gained by a seat at his master's side, is sadly diminished by his subsequent appearance in his shirt sleeves to carry a bottle of medicine to a labourer's cottage. On the slightest provocation, and often without any at all, the fickle villagers transfer their patronage to the more imposing equipage, and by consequence to its owner. On the other side the country doctor is threatened by the bone-setter, who has gained a reputation through the whole county by certain wonderful cures, and still more, perhaps, by the reckless audacity with which he sets to work. He visits every market town within a radius of twenty miles, receives his patients in the coffee-room of an inn, and handles their injured limbs with a roughness which gives them the most exquisite pain, and inspires them with the utmost confidence in his powers. His freely-expressed contempt for doctors gains him the good opinion of the ignorant, who are glad to believe that a man evidently not a gentleman can in any way look down upon those who have the advantage of him in this respect. He will work a stiffened joint backwards and forwards for some minutes, and then calmly ask his victim whether it is not much more flexible now. In the case of a long-standing sprain, he will take away his patient's crutch and order him to walk across the room without it. His ability to do so causes the patient himself great surprise, and is put down by some mysterious process of reasoning to the skill of the bone-setter. If by any fortunate chance he succeeds in a case where a regular doctor has failed, he knows how to

have the cure noised abroad through the country; but the more numerous instances in which his failures have to be remedied by duly qualified surgeons are somehow never heard of. Doctors regard him with as much affection as the rector feels for an open-air preacher who establishes himself on the village green, and despise him even more than a physician professes to despise general practitioners. In some parts of England the doctor has to contend with the grossest ignorance and superstition among the country folk, and finds among his rivals some who are the objects rather of ridicule than of jealousy. The belief in witchcraft has by no means died out among the lower classes. In Devonshire, for instance, people will travel miles to consult a "white witch," and we lately heard of a doctor who was called in to see a patient suffering from asthma, and found the man sitting on a low stool in front of the fire, while one of his grandchildren inserted the nozzle of the bellows inside his shirt-collar, and kept up a steady blast down his back. It appeared on inquiry that this proceeding had been recommended by a witch of high repute as a charm unfailing in its results.

However others may come and go, the doctor is always sure of his club patients, those fortunate persons who, for an annual payment of about four shillings, are entitled to such attendance and medicine as they may require. Every morning sees a gathering of them in the waiting-room. First perhaps comes a servant girl with a swollen cheek tied up in a complicated arrangement of bandages and handkerchiefs. She has put off the evil hour by the use of every pernicious drug which the united wisdom of the village can recommend, and now she is brought face to face with the terrible necessity of having a tooth extracted. She is taken into the surgery, the listeners outside are edified by her shrieks at the sight of the dreaded instrument, and she comes out again, tearful, but relieved. She is followed by a woman with a gathered thumb, the origin and progress of which she traces with the utmost minuteness, and the sufferer retires, gratified by the prescription of a poultice, or insulted by an offhand application of the lancet. A labourer troubled with rheumatism comes to ask for a bottle of medicine before proceeding to a long day's work in the marshy meadows which gave him his complaint; and a pale, sickly boy, who needs nothing but better food, and more of it, brings an empty bottle to receive the same panacea. A woman now rushes in breathless, dragging after her a screaming child, which has just made some very practical discoveries as to the properties of steam and boiling water; but the doctor is not allowed to look at the parts affected until the mother, eager to assert her respectability, has impressed upon him the fact that the offending kettle is a copper one—not tin. Some very curious demands are often made on these occasions, and the incident narrated in *Hard Cash* of a thrifty gardener who came to his doctor for some poison to kill mice may very well be true. We have known a farmer come and ask for a drench for one of his cows which had been taken ill in the night, and an old lady send to ask him to bring his stethoscope to test the soundness of her favourite dog's heart, which she feared was affected. A boy sometimes appears carrying the necessary copper coins carefully in his hand, and asks for "twopenn'orth of pills," character not specified. Perhaps the boy can scarcely be expected to fathom those mysteries of professional etiquette which require that he should be referred to the general shop of the village for the fulfilment of his wants. Impossible though it is to do without club patients in a country practice, they are generally looked upon as if they were almost paupers, who get the benefit of medical science at a ridiculously cheap rate. It may be imagined that doctors who disbelieve in the efficacy of drugs are not likely to do violence to their opinions for the gratification of their club patients, or to give medicines where they are not needed. Yet there are some men so enthusiastic about a favourite remedy, generally an expensive one, that they will give it without due regard to economy, and often without any real necessity. It is well that such men should have wives, brought up in medical society, who may check their extravagant tendencies, and administer such a caution as we once heard given to a doctor when he was going to his morning's work in the surgery. "Whatever you do, George, don't give any of those club patients quinine!"

ELECTION PETITIONS IN 1880.

THE list of election petitions which, after the shilly-shallying usual on such occasions, both parties have at last made up their minds to bring is sufficiently considerable, and, if all of them are persisted in, the Judges who, as is well known, are ill provided with work at present, will have plenty to occupy them. It seems that petitions have actually been filed from Canterbury, Hereford, Worcester, Gloucester, Chester, Lichfield, and Salisbury, all of which places appear to be anxious to prove that the old renown of cathedral cities in election matters is not wholly a matter of the past. Barnstaple rejoices in a petition and a counter-petition. Rye is threatened with an inquiry, which, as an ingenuous partisan of the sitting member is reported to have said, may probably result in the disfranchisement of the borough. Stroud, the most litigious of modern constituencies, where, in the last Parliament, gentlemen got seated and unseated in a bewildering manner, holds to its traditions. Bewdley, Bury St. Edmunds, Cheltenham, Evesham, Leominster, Knaresborough, Macclesfield, Tewkesbury, Wallingford, Westbury, Boston, Plymouth, and Horsham swell the tale of the rather unwise electoral bodies which have decided to invite public attention to the way they manage their affairs. On the other hand, Poole, another borough of dubious fame, has at the last moment adopted the judicious advice of a statesman of a past generation, and let it alone. Taunton, with the fate of its neighbour Bridgwater before it, has arrived at a similar resolution [illegible] sult of an ingenious compromise. The member for Kid[illegible] will, it is said, by accepting the Chiltern Hundreds, render unnecessary a petition, the result of which would, owing to an oversight, be a certainty. Lastly (and politicians on both sides ought to join in regretting this), Mr. C. S. Read has decided that he cannot burden himself and his friends with the expense of a regular scrutiny into the South Norfolk election, where, owing to a rejection of votes which we believe a majority of authorities deem valid, he was defeated by Mr. Gurdon. The Conservatives of Colchester—more confident or better stored with the sinews of war—persist in their scrutiny; and there are besides some Irish petitions, and doubtless one or two English ones, which we have overlooked, or which were filed at the last moment.

We have said that there is usually a good deal of shilly-shallying about election petitions, and the reasons are not very far to seek, especially under present circumstances. A petition has always been a very expensive and a very hazardous proceeding. Only fifty years ago its fate depended simply on the political opinions of the majority of the members of the Committee, and Charles Buller could say with tolerable truth that "nobody who came before such a Committee had confidence in its honour." Sir Robert Peel succeeded in altering this for the better; but it is doubtful whether even the reformed Committees were model tribunals, though it could not be said of them, as was once said of the General Assembly of Scotland in its capacity of a Court of Inquiry into the morality of ministers, that in all the experience of the speaker he could never remember an instance of a guilty person being brought before it. The hearing of the petitions before regular judges has done away with all suspicion of unfairness, but has made the result more uncertain than ever. But it is not, as a rule, the uncertainty of the direct result which deters petitioners so much as the tolerable certainty of the indirect results. Mr. A. may be unseated, or Mr. B.'s election may be confirmed; but it is more than probable that the enlightened and independent constituency which they have wooed will come out rather badly in the inquiry. Now just at this moment there is every reason why boroughs, and especially small boroughs, should be loth to expose the uncleanness of their linen. If the Liberals have come in upon anything definite at all, it has been on the extension of the county franchise; and though this may possibly be delayed to the last days of the Parliament, nothing but the unforeseen can prevent its being proposed, though accidents may still further postpone its accomplishment. Now extension of the franchise means redistribution of seats, and redistribution of seats means beyond all question the extinction of some of the smaller boroughs, and the reduction of the representation of the rest. Among these doomed sheep it cannot be doubted that those which show signs of ill health will have to go first, and the mournful anticipations of that Liberal of Rye whom we have already quoted must probably be present to the minds of not a few local politicians. It is sweet, no doubt, to take revenge on the enemy by possibly turning defeat into victory, and certainly compelling the victor to spend a great deal of money. But when the process carries with it a strong probability of extinguishing both victors and vanquished in one common political annihilation, the case is altered. On the whole, though idle people may anticipate some amusement from the forthcoming inquiries, Taunton and Poole must be pronounced wiser in their generation than Salisbury and Rye. Indeed, the presentation of so many petitions as have been actually filed shows better than anything else how keen the contest of last month was; while the abandonment of that for South Norfolk, accompanied as it has been by a public avowal of the reason, shows that there was some truth in the assertions recently made of the comparative moneylessness of the Conservatives in that contest.

Supposing that most, or many, of the threatened petitions actually come on for hearing, we shall have a rather interesting opportunity of determining the influence of the Ballot on purity of election. The contest of 1874 was so much of a surprise, people were so new to the Ballot, and wishes and hopes of all kinds were so far drowned in the one general wish to be delivered at any price from Mr. Gladstone, that there was not much occasion for estimating this. Indeed it was not uncommonly held by outsiders before the late election that direct bribery was almost impossible, or at least highly improbable, under the Ballot, while intimidation was out of the question. "Faith unfaithful" might keep the voter "falsely true," so far as to make him give the vote he had been paid for; but the most probable result of threats would be to make him resent them by the safe and secret means of the ballot-box. Experience partly confirmed and partly falsified these expectations. The Ballot, as now managed, is not an ideally secret method of voting, but it is still difficult to know exactly how each voter has voted, unless he chooses that the agent should know it. The signal failure of the "Knowsley screw" seems also to show that, as far as intimidation is concerned, nothing short of forcibly keeping voters away from the poll (which would be dangerous) will now do. It is not the same, however, with bribery. The check furnished by open voting upon the bribed is of course impossible. Never more can such a

[illegible] of electioneering be played as that [illegible], secured his judgeship for one of the most brilliant and [illegible] of Irish lawyers. On that occasion—the tale is worth repeating, for the days of such things are being rapidly forgotten—it was of the highest importance for the candidate to be returned, and his constituents knew it. They had been wont to receive each his half of a five-pound note from the agent in advance, and then, after doing their duty, the other half. At this critical moment they struck, and demanded double pay. The candidate was consulted, and gave commands. Each independent voter received half a ten-pound note, and gladly voted for the generous "[illegible]." But when they came for the other halves they were directed each to apply to one of his fellows. The bite was complete, there was no remedy, and each baffled pair, half a ten-pound note being a non-negotiable commodity, had to join their stocks and be content with five. Nothing of this transcendent sort, we may be sure, was done the other day; but every one who has been engaged or has had friends engaged in the contest must have heard stories to the effect that plenty of money changed hands which will not figure in the official accounts. In one borough votes were said to be going at 25*l.* apiece; in another, a batch—so rumour has it—were bid for at ten times that sum in the last hour of the polling, and bought by the other side at a higher rate still. This is, indeed, a sufficiently obvious method of bribery, not devoid of risk, but worth trying in boroughs of moderate size, especially in a hard-fought contest. It may have been noticed that in not a few such boroughs the register was either completely or very nearly polled out. Now with the present system of voting it is perfectly easy for the agents to note down every man who votes, though not perhaps how he votes. By comparing this with their canvass-book they can tell approximately what the result is, and also what effect the remaining voters will have. If these, being venal, have designedly held off, a sufficiently large offer at, say, half-past three o'clock, may turn the scale. It ought to be added that, as the polling booths are at present arranged, nothing is easier than for the voter, if he chooses, to show the agent how he has voted. Generally speaking, there is no screen at the back of the booth, and witnesses of the transaction are sitting or standing not an umbrella's length behind. In the larger boroughs the thing is doubtless more difficult, and here the *modus operandi* is probably not yet complete, though, thanks to Mr. Chamberlain's favourite organization, it will doubtless soon be so. The method of corrupting elections in these is by means of subordinate agents, each of whom has his *grex* of voters, probably of the humbler class for the most part. The agent of course would be responsible for his "tail," and if a system of payment by results were adopted, the interest of the whole body would be to be faithful, especially if, as at Birmingham, the organization were constantly kept in working order by municipal elections, School Board elections, and other rehearsals for the great event. The admirable manner in which the Caucus system lends itself to corruption, in which indeed it must inevitably result, is of course one of its main beauties. By degrees it is probable that little facts of this kind will ooze out. But it is as yet too early for this. The revelations, such as they are, of the next petitions will probably be confined to less scientific and wholesale rascality. Considering that only a single decade has passed since the days of open voting, the habit of being bribed cannot be supposed to have died out of the small boroughs. An honest Little Pedlingtonian would probably be a good deal hurt if it were hinted to him that the secrecy of the Ballot would prevent his giving due value for his five or his fifty pound note. He would reply proudly that times might change, but morals did not. It is easily believable that in the same way treating may have gone on to a considerable extent, with the object of producing a generally favourable impression as to the candidate being a jolly good fellow. We shall, however, be a good deal wiser as to this a few weeks hence than we are now. The two millions, or two millions and a half, which, according to the best authorities, it has cost to replace Lord Beaconsfield by Mr. Gladstone, may be accounted for in new or old ways; but it is quite certain that not a little of the amount has gone as it should not. No happy man, it is to be feared or hoped, got 300*l.* a year for his vote, as did one happy man fifteen years ago in one of the most beautiful of Western boroughs, a place not only to live and die in, but, above all, to vote in. To buy a vote now is to buy the proverbial pig in the proverbial poke. But that pastime is still in various ways a popular one, and the stake at an election is sufficiently attractive to make gamblers go in for it, though it may be very far from a certainty. It is a bad thing to sell a vote, and not a good thing to buy one; but any Professor of Moral Philosophy who is at a loss for a subject to prelect upon might perhaps discuss the point whether to sell a vote is worse than to give it without taking the trouble to understand the questions at issue—whether to buy it is more culpable than to obtain it by misrepresentation and abuse of opponents.

THE LATE FALL IN PRICES.

THERE has occurred a heavy fall in the prices of commodities, more particularly of iron and colonial produce, such as sugar and coffee, involving serious losses which may have wide consequences, and there is anxious speculation whether this is, after all, the end of the revival of trade respecting which such high hopes were entertained. Before we attempt to find an answer to this inquiry, let us endeavour to form an accurate conception of the amount of the fall, and to trace how it has come about. In July last Scotch pig-iron was as low as 40*s.* 8*d.* per ton; it began to rise then, and in January had reached 71*s.* 4*d.*—a rise of 30*s.* 8*d.* per ton, or over 75 per cent. Last week the price had come down again to 48*s.* 1*d.*—a fall of 23*s.* 3*d.*, or over 57 per cent. During the present week there has been a further decline; but as it is not our object to give the very latest quotation, it is enough to note that the downward movement has already swept away most of last year's rise, and possibly may not even yet have come to an end. To take another example, Mauritius crystallized sugar stood for months last summer at 23*s.* 6*d.* per cwt.; in December it had gone up to 28*s.* 3*d.*—a rise of 4*s.* 9*d.* per cwt., or over twenty per cent; at the end of last week it had fallen to 24*s.*, barely 6*d.* above last summer's quotation. Good Ceylon coffee, to take a third example, was as low last year as 64*s.* 6*d.*, and in December had gone up to 72*s.*, being a rise of 7*s.* 6*d.*, or over eleven per cent; last week it had gone down to 66*s*, a fall of 6*s.*, or between eight and nine per cent. It is needless to multiply instances. We are not making out a Price Current, and these examples will suffice amply for our purpose. It is evident from them that somewhere very heavy losses must have been incurred, and that the fluctuations up and down have been so sudden and so extreme as naturally to make people apprehensive as to the soundness of the revival which has changed the whole face of business.

But because the fears entertained are natural, it does not at all follow that they are well grounded. To test this point, let us inquire how the revival came about. It will be in the recollection of our readers that it originated in increased purchases on American account. The panic in 1873 was followed in the United States by years of unexampled depression. Factories were closed all over the country, workpeople by hundreds of thousands were thrown out of employment, and it almost seemed as if industry was brought to a standstill. The people had been living too fast, and the crash brought them to a sense of their real condition. They at once resorted to the most stringent economies. They cut down wages, they saved every possible expense, they curtailed their foreign purchases, and large numbers of them turned from the workshop and the factory to the cultivation of the soil. Three magnificent harvests, accompanied by an unusual demand and good prices in Europe, rewarded their labours, and last year the nation found itself once more with the means of enjoying its old comforts and luxuries. The construction of railways interrupted in 1873 was resumed; the consumption of sugar, coffee, and other luxuries rapidly increased; and it became at once evident that during the bad times through which the country had passed the production had fallen far below the demand. Orders were sent to England and the Continent for the iron which the native works could not furnish early enough for the railway contracts; Brazil was ransacked for coffee, and then Ceylon was placed under contribution. The demand for sugar was intensified by the failure of the beet crop in France. A very considerable rise of prices was justified under these circumstances, for during the long depression the production of all the world had become adapted to a low demand, and an augmented price was required to stimulate the dormant powers of production into new activity. But, as always happens in such cases, the rise was exaggerated by speculation. In several instances keen men of business instinctively felt what was coming, and, buying up large stocks at the lowest quotations, realized fortunes when the spurt came. The knowledge of this inflamed the minds of rasher and less skilful persons, who rushed in at the topmost prices, and bought when experts were selling. Most of these were absolutely ignorant of the trades which they disturbed, often even did not know the appearance of the articles they bought. There was a story current in the autumn of a speculator who went into a broker's office in Mincing Lane and requested him to buy some hundreds of tons of a rare spice, and, when told that the world could not supply so large a quantity, dipped his hand into an open jar and, asking what were the contents, ordered the purchase of as much as could be had of a commodity with which he had then for the first time made acquaintance. This was the spirit in which Scotch pig-iron was run up over 75 per cent. in four or five months, and all who knew what was going on, and did not themselves join in the gambling, were quite prepared for the inevitable reaction. The only doubt was as to the time when it was to be expected.

So far all are agreed as to the facts; but some are inclined to go further, and say that production now has shot ahead of consumption as far as it had lagged behind last summer, and that consequently the fall of prices will be permanent. This was the drift of an article published by the *Times* about a fortnight ago, which has drawn a reply from one of the principal ironmasters of the North of England. For it is to be observed that those engaged in the trade who are most competent to form an opinion by no means share in the pessimist views now current. Briefly stated, the argument of the *Times* is as follows:—That the United States only bought from us because their own furnaces and forges were not equal to the sudden demand, but that 127 new furnaces have now been blown in, still leaving 293 idle; and that consequently, although they will use up 1½ million tons this year more than last, they will need to take from us no more than 100,000 tons. Further, that our own furnaces have been increased by 141, capable of producing over two million tons—that is, more than sufficient to meet all possible demands. On the authority of the Secretary to the Western Iron Association of the United States, Mr. Samuelson's answer to this is that, whatever

may be the capacity of the furnaces lately blown in, the scarcity of suitable ore is such that the production will be a million tons less than the *Times*' estimate, and consequently that the United States will require from us 800,000 tons; and that, as regards the home furnaces blown in, the *Times*' estimate is 600,000 tons above the mark. Moreover, Mr. Samuelson points out that last year's production was lower than that of any year since 1870, with the exception of 1874, and the increased production of this year, therefore, is not likely to result in a glut, even assuming that the American demand falls off very seriously. The answer seems complete. When we read of furnaces being blown in, we are apt to infer hastily that the production increases in the ratio of the numbers, but this is not so. A man blows out a furnace while his competitors keep theirs in blast, because it is less productive or more costly to work, and for either reason—generally both—is less profitable. When he blows it in again, it obviously does not produce as much as those that were kept in blast all through. This is why the 141 furnaces newly blown in in England, Wales, and Scotland are found to produce 600,000 tons less than the *Times* calculated. Manifestly, the same thing holds good in the United States, and therefore nearly 300 furnaces remain unlighted, while more than 900,000 tons of iron have been imported from this country between August and the end of March. The reserve power which alarms the writer in the *Times* can be called on only if prices run up far higher even than the January level. Meanwhile the prosperity of the United States is unchecked; the necessity is as great as ever for new railways to open up fresh regions to colonization, to fill in links in systems still uncompleted, and to bring mines into communication with the world's markets. Other countries do not less need railways, as, for example, the Australasian Colonies, India, now happily free from famine, the South American States, and Austria-Hungary and Russia, whose credit will improve if the Eastern question is not reopened. Here at home iron shipbuilding has become very active, large orders having been placed on the Clyde within the last few days. And the new loan which the London and North-Western Company is about to raise, and which, it is understood, will be expended in extending the four lines of rails, shows that the home railway demand also is increasing, and, with a good harvest, may be expected to improve considerably.

What has really caused the great fall to which we have called attention is the inability of speculators to pay for their purchases now that the time has come for them to do so. As we have said above, many of them were entirely ignorant of the trades into which they plunged—not a few, indeed, of all trades; and, as they had neither experience nor judgment to guide them, they necessarily went too far. In the nature of things the speculator is a sanguine being. Several circumstances have combined to intensify the scare which arose when the speculators found themselves called upon to pay, and broke down the market by too many sales. Supply and demand are nearly accommodated to one another by the large increase of producing power, and for that reason alone a fall was inevitable. In the United States, moreover, money has for months been excessively dear, and this has at last restricted speculation. So long as he could obtain loans freely, the speculator was not daunted by high rates. But when renewals were refused, or were granted with much difficulty, he took fright. There has consequently been a heavy fall in the United States also. Here at home, again, the apprehension of strikes and wages disputes has made all persons engaged in genuine trade alive to the serious consequences that might ensue if a factitious high level of prices was longer maintained. Add to all this, the interruption to business caused by the elections. The interruption has proved much more considerable than had been anticipated and has lasted much longer. One reason is the extreme bitterness of the struggle, and another is the surprise which the result has caused to all parties, and the uncertainty in which speculators are involved. The attitude in this respect of the Stock Exchange, which is the speculative market *par excellence*, and typical of all others, is strangely misunderstood. The speculator, no doubt, has his political preferences, like the merchant or the professional man; but as a speculator he is only concerned with the bearing of a change of Government upon the market in which he operates. And in the present case it has been unusually difficult to estimate this, because of the well-known but as yet undeclared divisions of opinion among the supporters of the new Cabinet.

THE PICTURE GALLERIES.—I.

THE opening of the two great London Galleries of contemporary art has this year been almost simultaneous. The "private view," both at the Academy and the Grosvenor Gallery, took place yesterday, while the "press view" at the Academy on Wednesday was followed by that at the Grosvenor on Thursday last. To see and to form any kind of opinion on 1,658 works of art between the hours of 10 and 6 in one day is the kind of task which was set to the unhappy, but subsequently triumphant, maiden in the fairy story by Rumpelstiltzken, and which is now set by the rulers of the Royal Academy to critics. Unfortunately the parallel is not carried out to the end.. No fairy is likely to appear to ensure victory for the critic. The thing is monstrously absurd, and could hardly occur in any other city of pretensions equal to those of London in art matters. Against this old standing grievance we have to set the improvement which is evident in the matter of hanging pictures at the Academy. Of course, in accordance with an unfortunate rule, there are pictures of little worth which occupy valuable space, and, as a natural corollary of this rule, there are other pictures of merit which are disadvantageously placed; but there is at least an absence of that carelessness in the general arrangement of which we have too often been obliged to complain. At the Grosvenor, of course, where there are not more pictures exhibited than can be well seen and well hung, there is no ground for dissatisfaction on this point. No doubt, the controllers of the Academy arrangements have many difficulties to contend with. The time given for deciding on the works sent in is impossibly short, and this might surely be extended, as might the time given to critics for pronouncing their verdict after that of the Council. Perhaps, however, it might be thought that this would be giving an unfair advantage to the critics, who might then condemn at their leisure what the Council had approved in their haste. The number also of works to be exhibited and placed is, apart from the question of the time devoted to their consideration, impossibly large. Whether this could or could not be diminished must remain a question for those who know all the ins and outs of the matter. Any definite and obvious change would of course give offence to many people, but no improvement can be effected in matters of the kind except by those who do not mind incurring a certain amount of odium in a good cause.

We do not propose for the present to attempt doing more than giving a general sketch of some chief points of interest in the exhibitions. The Academy is, as a whole, very well up to the mark, but, speaking generally, has not the attraction which is sometimes found either in some striking work of a recognized master, or in the coming to the front of comparatively unknown painters. The Grosvenor, on the other hand, has such an attraction in the space devoted to the works of M. Bastien-Lepage, whose powers, though well enough known in France and far from unknown in England, have never before been shown to such advantage in London. Of these, as of other productions at both Galleries, we hope on future occasions to speak in detail. Meanwhile it must be enough to take a general survey.
